BOOK-KEEPING.

BOOK-KEEPING, is the art of recording mercantile transactions in a regular and systematic manner.

A merchant’s books should exhibit the true state of his affairs. They should shew the particular success of each transaction, as well as the general result of the whole; and should be so arranged as to afford correct and ready information upon every subject for which they may be consulted.

Books may be kept either by single or double entry.

Single Entry is chiefly used in retail business; it is the most concise and simple method of book-keeping; but not the most perfect, being defective in some essential particulars.

Double Entry is generally used in wholesale and mercantile affairs; whence it is sometimes called Merchants’ Accounts. This method is universally preferred in extensive commerce, being the most comprehensive and systematic in its principles, and the most certain in its conclusions. Book-keeping, as a science, is, therefore, understood to mean the method by double entry; and in this sense we shall use the term, unless when there is occasion to distinguish double from single entry.

BOOK-KEEPING, History of. The origin of book-keeping, like that of most other useful arts, is involved in great obscurity. It is generally supposed to have been first practised at Venice, in the fifteenth century, when that city was the grand empire of Europe. Some authors, however, think that double entry was known to the ancients, and revived only in Italy, with the revival of commerce; and certain quotations are adduced in support of this opinion. Thus Pliny, in speaking of fortune, says, “Huic omnibus expensa; huic omnibus feruntur accepta; et in tota ratione mortuarum fola utramque paginam facit,” lib. ii. cap. 7.

Similar passages may be likewise quoted from others, which shew, that the ancients entered the receipts and pay-
La Porte's remarks on the want of method and arrangement in the old systems of book-keeping, will, in some measure, apply to his own, though it still continues a favourite work in France. We shall, however, take no further notice here of foreign publications, but confine our observations to those of our own country, where every subject connected with commerce seems to have been cultivated with the greatest industry and success.

The first treatise on book-keeping, in the English language, of which there is any account, was published in the year 1543 by Hugh Oldcastle, a schoolmaster; and it was reprinted, in 1588, by John Mellis, under the following curious title: "A brief instruction and manner how to keep books of accounts, after the order of debitor and creditor, and as well for proper accounts, partible, &c. by three bookes, named the memorials, journal, and ledger. Newly augmented and set forth by John Mellis, scholl-maister of Lodon. Imprinted by him at the Signe of the White Beare, nigh Hayward's Caile, 1588, 12mo." In his Epitile to the Reader, Mellis says, "And know ye for certain, that I presume not to set forth this work of mine own labour and industry, for truly I am but the renuer and returner of an ancient old copie printed here in Londen the 14th of August 1543." See Ames's Typographical Antiquities, vol. ii. p. 753.

In 1569, a systle of book-keeping was published in London by James Peele, who says, in its preface, "that he had instructed many mercerntile people in this art, which had been long professed in other countries, though then new in England."

There is no trace of any other work of the kind until the year 1652, when John Collins, an eminent mathematician and accountant, published a large work, entitled, "An Introduction to Merchants' Accounts," which served long as a standard book on the subject.

About the beginning of the following century, several smaller systems were written, chiefly by Snell, Hatton, Malcolm, Webbter, Miers, and Stevens; but the most popular work that had yet appeared, was Main's "Book-keeping methodized," published in 1738, which, after passing through three editions, was reprinted, with alterations, in 1768, under the new title of "Book-keeping modernized." And such alterations, he says, became necessary, "in consequence of the constant change and perpetual flux in the forms and fashions of accountthip." But it may be observed, that if this edition was modelled after the real practice of that time, the forms and arrangements of merchants' accounts must have since undergone great changes, and manifest improvements. In Main's book-keeping, however, the principles of double entry are correctly explained; but the rules and examples are too numerous and verbose for school practice.

From the first appearance of this work, to the year 1789, numerous other systems were published, better adapted to the purposes of teaching the art, though differing but little in arrangement. The most generally approved were those of Dodson, Welton, Dom, Hutton, Hamilton, Gordon, Dowling, and Jackson. Treatises were also written, within the above period, by Croby, London, Shortland, Wood, Cooke, Sedler, and Dillworth.

On a review of the foregoing publications, it does not appear that the theory of book-keeping had hitherto kept pace with the improvements of practice. While merchants were constantly adopting plans of arrangement, which promoted perspicuity and correctness, and diminished the labour of the counting-house; schoolmasters, the chief authors on book-keeping, seem only to consult or imitate each other's works, which had been long considered by men of business as obsolete or impracticable.

A work of a very different description was published in 1739, by Benjamin Booth, a merchant, who thus observes in his preface: "It is surprising that in a commercial country like this, there should not be a treatise on the subject (book-keeping), which, when applied to a large scale of business, can be reduced to practice. Thence I have seen, appear to have been written by persons who had not abilities sufficient for the undertaking, or by such as never had an opportunity of bringing their theories to the test of experience." This elaborate work, which is evidently the result of experience, contains various examples of judicious arrangement, but it is not elementary, having only a journal and ledger.

Some smaller publications followed, which deserve commendation, particularly those of Mr. Wicks and Mr. Shires. The latter work is rated to be the result of thirty years' experience. It exhibits much neatness and ingenuity in the arrangement; but, like Booth's Book-keeping, it contains only a journal and ledger.

In tracing the progress of Italian book-keeping, something should be said of a rival method, entitled the "English Book-keeping," published by Mr. Jones in 1795, a work chiefly remarkable for the enormous subscription raised on the occasion. A prospectus of this performance was previouly circulated, announcing the discovery of an infallible method of book-keeping by single entry, and at the same time represtenting the Italian method as delusive and erroneous.

By high promises and accredited recommendations, subscriptions (at a guinea each) are said to have been obtained, to the amount of six or seven thousand pounds. The work, however, did not answer the expectations of the public. Several ingenious tracts soon appeared, defending double entry, and exposing the insufficiency of this new system; and one of peculiar merit, written by Mr. Mill, closed the controversy. This gentleman, in order to form a comparative elucidation between the English and Italian methods, arranged Mr. Jones's materials into a journal and ledger, by double entry; and, in the course of the operation, detected an essential error—a detection which completed the triumph of double entry.

The English system of book-keeping, though universally rejected, has proved useful to the public as well as to the author. It gave rise to much investigation on the subject; and the extraordinary eagerness manifested in the subscription, shewed that men of business wished for a more practical system of merchants' accounts than had been hitherto offered to their notice.

In 1801, Mr. Kelly published a work, entitled "The Elements of Book-keeping," which appears to have met with very general approbation, and from which the present article is, by permission, extracted. The subsequent editions of this publication have been considerably enlarged by tracts on exchange, banking, and other commercial subjects; but its principal object (as stated in the preface) is to explain and illustrate the modern improvements of merchants' accounts. Of what these improvements consist, may be known from the following account of the work, given in Nichollson's Philosophical Journal, Feb. 1802.

"The improvements, which time and experience have effected in book-keeping, do not comprehend any change in the original principle of double entry, but in the arrangement and classification of similar accounts, which facilitate the operations of commerce nearly in the same manner that the business of manufactures is expedited by the division of labour. The elementary treatise before us (Kelly's Book-keeping)
BOOK-KEEPING.

Principles of Book-keeping both by Single and Double Entry.

Single Entry chiefly records transactions on credit, and for this purpose two books are required, called the Day Book and the Ledger.

The day book begins with an account of the owner's property, debts, &c.; then follows a detail of the occurrences of trade, set down in the order of time in which they take place.

The name of the person, or customer, is first written with the term Dr. or Cr. annexed, according as he becomes debtor or creditor by the transaction; and this may be distinguished by the following general rule:

"The person who receives is Dr. and the person who gives or parts with any thing is Cr."

Thus, if I sell goods on credit, I enter A. B. the buyer, Dr. to the goods, specifying their quantity and value.

If I buy goods on credit, I enter C. D. the seller, Cr. by the goods, specifying their quantity and value.

By the same rule, if I pay money, the person to whom I pay it is made Dr. to cash for the amount; and if I receive money, the person from whom I receive it is made Cr. by cash, for the amount.

And if debts be contracted or discharged by any other means, the same rule is observed; the person, who becomes indebted to me, is entered Dr. and the person to whom I become indebted, Cr.—Also, the person whose debt I discharge is made Dr. and he that discharges a debt due by me, is Cr.

The ledger collects together the dispersed accounts of each person in the day book, and places the Drs. and Crs. upon opposite pages of the same folio. The person's name is written in large characters as a title; on the left hand, or first page, he is styled Dr.; and on the opposite, or right hand page, Cr. On these pages the transactions are entered as they stand and Drs. or Crs. in the day-book. For instance, A. B. is debited for whatever he has bought of me; and on the opposite page, he is credited for the payments he has made. In short, whatever I have given him, is on the Dr. side, and what he has given me on the Cr.; and the difference between the Dr. and Cr. sides is called the "balance."

A short Specimen of Single Entry.

January 1, 1805.

Suppose John Smith owes me 100l. which is my whole estate; and suppose that on the 2d of January, I buy of him 80 yards of cloth, at 15s. per yard; on the 3d, I sell James Taylor, on credit, 60 yards of the said cloth at 18s. 4d. per yard; and on the 4th, James Taylor pays me in part 40l. Required the day book and ledger of the foregoing transactions, according to single entry, and also the profit or loss.

Day Book.

To post the foregoing Accounts into the Ledger.

The ledger being ruled in folio form, according to the following specimen, with the left side for Dr. and the right side for Cr. also a margin for the date, and near the money columns, one for reference to the day book, proceed as follows:

Open an account for John Smith, and debit him, on the left hand page, for 100l.; and for the 2d day's transaction, credit him for 60l. on the opposite page.

For the 3d day, open an account for James Taylor, debiting him for 55l.; and for the 4th day, credit him for 40l.

When every transaction is thus posted, each account is balanced, by subtracting the larger sum or side from the greater, and then putting the difference or balance under the smaller side, by which both sums are made equal.

John
BOOK-KEEPING.

John Smith owes me - - £ 4.5
James Taylor owes me - - 15
I have in Cash - - 4.2
I have unaltered 120 yards of cloth, at 15s. per yard (the prime cost) 15

The net of my estate.
100 Stock beginning.

£ 10 gain.

Hence I have cleared 10l. by the sale of 60 yards of cloth at a profit of 35. 4d. per yard.

Remarks on Single Entry.

By Single Entry I cannot tell what goods are unfolded, or my profits or losses by my books only, except when the transactions are but few, as in the foregoing examples. For as the ledger here contains only the accounts of persons dealing on credit, it affords no other knowledge to the owner, than what debts are due to him, and what he owes.

But if he wishes to know what goods are undistributed, or what he has gained or lost by the whole or any part of his dealings, he cannot obtain this knowledge by single entry, without taking a flock; that is, he must weigh or measure what goods he has unfolded; and their value, added to the cash in hand, and the balance of debts, will shew the net of his estate, and this, compared with his original flock, will shew his profit or loss.

Hence book-keeping by single entry is essentially defective, as it affords no method of ascertaining the state of a merchant's affairs, without taking a flock; a task which is both laborious and liable to error, and which at best affords no adequate means of preventing embellishment or detecting fraud; but these objects are attained by double entry, perhaps as effectually as human ingenuity can devise.

Double Entry.

In double entry, three principal books are required; the WASTE BOOK, JOURNAL, and LEDGER.

The Waste Book gives a regular detail of the transactions of business, set down in the order of time in which they take place, and stated in a clear, simple, and circumstantial manner.

The Journal records the same transactions as the waste book, but they are differently expressed; for here, the Drs. and Crs. of the various accounts are ascertained, in order to transfer them with more ease to the ledger.

The manner of ascertaining the Drs. and Crs. of each transaction here is the same, in effect, as in single entry; but in double entry, things, as well as persons, are made Drs. and Crs.; and one thing or person is made Dr. to another thing or person.

Thus, if I sold cloth to A. B. on credit, I enter it in the journal, A.B. Dr. to Cloth. If I buy cloth of C. D. on credit, I journalize it, Cloth Dr. to C. D.; and if I buy or sell for ready money, or barter one kind of goods for another, the following general rule must be observed:

"What I receive is Dr. to what I give or part with."

For instance, if I buy cloth of ready money, the journal entry is "Cloth Dr. to Cash;" and if I sell it for ready money, "Cash Dr. to Cloth;" always specifying the quantity, price, and amount.

When two or more persons or things are included in the same account, they are expressed by the term "Sundry," or "Sundry Accounts," thus, if I sold cloth for part money, and the rest on credit, I journalize it, "Sundry Drs. to Cloth;" and then specify the particulars.

The following rules for distinguishing Dr. and Cr. will apply in all cases:

The person to whom, or for whose account I pay, or furnish the means of payment, is DEBTOR.

The person from whom, or for whose account, I receive, or who furnishes me with the means of payment, is CREDITOR.

Every thing which comes into my possession, or under my direction, is DEBTOR.

Every thing which passes out of my possession, or from under my direction, is CREDITOR.

The word INOCS is sometimes used to affix the memory as being composed of the initials of the rule—In DEBTOR, Out CREDITOR.

The following lines may likewise affix the memory in journalizing:

By journal laws, what I receive,
Is debtor made to what I give;
Stock for my debts must debtor be,
And creditor by property;
Profit and loss accounts are plains,
I debt lots, and credit gain.

The ledger collects the scattered items, articles, or transactions, from the journal, and places them under their respective heads, opposing the Drs. and Crs. of each, on the same principle as in single entry; but here accounts are opened for goods as well as for persons, and every account is entered twice, whence this method is called "double entry."

The accounts of the ledger are distinguished into three kinds, personal, real, and fictitious.

Personal accounts are the same in double as in single entry; and every person is debited or credited as he stands Dr. or Cr. in the journal.

Hence every personal account, suppose that A. B., contains on the Dr. side all items or articles, by which he becomes indebted to me, and on the Cr. side all items or articles, by which I become indebted to him.

Real accounts are those opened for merchandise, or any other species of property, such as cash, bills, ships, houfes, &c. Here, as in all other accounts, each transaction is entered on the Dr. or Cr. side, as it stands in the journal. Thus, goods bought are entered on the Dr. side; and when these or any part of them are sold, they are entered on the Cr. side; by which the quantity on hand, and the profit or loss on each article may be, at any time, ascertained.

Fictitious accounts are those of stock, and profit and loss.

Stock is a term used to represent the name of the merchant or owner of the books. On the Dr. side is entered the amount of the debts which he owes when the books were opened; and on the Cr. the amount of the cash, goods, debts, and any other property then belonging to him. The difference between the Dr. and Cr. sides shews his net stock, at that time.

Profit and loss is a general term used for either gain or loss, such as may arise from trade, interest, commission, &c. On the Dr. side are entered all transactions of losses; and on the Cr. side those of gain—the difference shews the net gain or loss.

A short Example of Double Entry.

### Rules for posting the Journal into the Ledger.

The ledger being ruled with the Dr. side to the left, and the Cr. side to the right, (as before described) let there be a space allotted to the left of each page, for the day of the month, and to the right, for the page of the journal from whence each account is taken.

The accounts are mostly opened in the ledger, according to the order in which they stand in the journal; this is not, however, essential to the truth of the work, but it is the most regular method, and the most clear to learners. The flock account stands first, and, like all other accounts, is debited or credited as journalized.

Here flock is Cr. by John Smith; then, for the second entry, John Smith is Dr. to Stock, for every Dr. must have a Cr. and every Cr. a Dr.

By the same rule the other accounts are entered twice in the ledger; first, in the direct way, as they stand in the journal, and then reversed. Thus, the second day’s account is posted, Cloth Dr. to John Smith, and then John Smith Cr. by Cloth.

In the same manner the third and fourth day’s accounts are posted; James Taylor is debited to Cloth, and Cloth credited by James Taylor; Cash is next made Dr. to James Taylor, and James Taylor Cr. by Cash.

Here it may be observed that, when an account is once opened in the ledger, every following transaction which concerns it, must be brought back, and entered there on the proper side, as an account is never opened twice, though it may be transferred for want of room.

To make a trial balance.

When every account is posted twice from the journal into the ledger, and on opposite, or contrary, sides, it is evident that all the sums on the Dr. side will equal all those on the Cr. side.

This trial, or check, is generally made on a separate paper, and it may be performed every day, month, or year, according to the extent of the business. The titles of the ledger accounts are written under each other with Dr. to the left, and Cr. to the right. Annexed to each, on its proper side, is set down the sum of every Dr. and Cr.; and both sides will agree if the work be right; as in the following example, from the preceding ledger.

To make the general balance, and close the ledger.

The journal being all correctly posted, an account must be opened for profit and loss, and another for balance. These two accounts, with that of stock, are not to be closed until the others are balanced.

Proceed, therefore, to the second account, where the difference between the Dr. and Cr. sides appears to be 40l.; set this sum under the smaller side, making both equal.

This balance or difference being on the Cr. side, John Smith’s account is therefore credited by balance, and on the balance sheet it is entered on the Dr. side: for if John Smith be Cr. by balance, then is balance Dr. to John Smith.

By this simple method all personal accounts are closed; but in real accounts a double operation is necessary, when any of the goods remain unfold, as these must be first balanced.

Thus, in the cloth account, the quantities on the Dr. and Cr. sides must be compared, and their difference set down under the smaller quantity, making both sides equal.

Here the difference is 20 yards, which, at first cost, is worth 15l.; this sum must be entered on the Cr. side of the cloth account, and then on the Dr. side of the balance account, thus making cloth Cr. by balance, and balance Dr. to cloth.

When the goods on the Dr. and Cr. sides are balanced, the money columns must be next compared, and their difference shows the profit or loss on the article. In the cloth account the Cr. side is 10l. more than the Dr.; hence cloth is made Dr. to profit and loss for that sum; and profit and loss Cr. by cloth for the same.

James Taylor’s account, and the account of cash being next balanced, proceed to prove the work.

The proof of book-keeping.

The accounts being all balanced, except those of stock, profit and loss, and balance, let the profit and loss account be first closed. Here profit and loss is Dr. to profit for 10l. gained, and therefore stock is made Cr. by the stock.

The stock account must be next closed, where the balance appears to be 110l. Hence stock is made Dr. to balance for this sum, and the balance account must therefore be made Cr. by stock for the same.

Now if the work be right, both sides of the balance ac-
tion, with a reference to the subsidiary book, where the particulars are to be found.

In the subsidiary books each month's occurrences are chalked together, and so disposed as greatly to simplify the journal; but the principal advantage of this arrangement consists in carrying a whole month's cash, or bills, in one line to the ledger: and the same may be done with a month's commission, interest, insurance, &c. though the practice is not yet become so general. Specimens of both methods are here given.

Besides these advantages of simplicity and conciseness, the subsidiary books have other important uses as originals. Every exporter and importer of goods upon commission, must have an invoice and sales book, and the cash and bill books are necessary in all departments of commerce.

Where subsidiary books are kept for every kind of business, a waste book like the following may be dispensed with: though such will be found highly useful, both as an index and day book. But, in teaching, a book of this kind is essentially necessary, not only as connecting the other books, and giving a ready reference to each, but as affording a regular history of the business, which the learner should always understand. It is perhaps the want of this knowledge that renders the theory of book-keeping so much more obscure and perplexing than the practice.

THE WASTE OR DAY BOOK.

This book opens with an inventory of the merchant's property, (supposed to be transferred from the balance account of a former ledger,) after which, a general register or diary is given of all transactions, in the order of time in which they happened, with a reference to the subsidiary books, where such are regularly entered. The following are the references:

BOOK-KEEPING.

SUBSIDIARY BOOKS;

THE BILL BOOK.

The bill book is an index or register of bills of exchange, whether receivable or payable.

Bills receivable are those which the merchant receives in payment of some debt or contract—and bills payable are such as are drawn upon him, and which he must pay when due.

When Bills receivable come to hand, their particulars are entered in their respective columns of the bill book; and the particulars of bills payable are likewise entered in their proper columns, when advice is received of their having been drawn, or when they are left for acceptance.

The use of the bill book will be understood by observing how the two following bills are entered.

INVOICE BOOK.

An Invoice is a paper sent off with goods exported on commission. The preamble generally contains the name of the ship, master, place of destination, and of the person to whom the commission is made.

An account is next given of the quantity and amount of the goods, which are generally charged at the bona fide prime cost. The trademen's Bills of parcels are either copied or sent with the invoices, and referred to. The shipping charges are added to the value of the goods, and upon this sum the agent or factor generally charges his commission. When he injures the goods, he has also a small commission on the capital incurred, which capital is allowed to be something more than the value of the risk, in order to cover the amount of the risk, premium, and other expenses, in case of loss.

The cost of insurance generally concludes the invoice, and the agent signs his name at the bottom with the words, errors excepted; this signature, however, does not appear in the book.

The invoice book, which contains the copies of all invoices sent off, is sometimes called the invoice book outward, to distinguish it from the invoice book inward, which contains copies of invoices received from abroad. But this book is often dispensed with, by preferring the originals, either filed, or in pigeon-holes, or pasted in a blank book made for the purpose.

Invoices of goods received to be sold on commission, are generally copied into the sales book, to which the charges are added.

The following invoice is here deemed a sufficient specimen, and those referred to in the wafle book may be understood as arranged in the same manner.
BOOK-KEEPING.

Invoice of Sugar shipped on board the Neptune, Henry Marsom Major, for Naples, by order of William Pemberton, Merchant there, for his Account and Risk, and to him consigned.

London, Jan. 1, 1805.

The Sales Book, or Factory Book.

This book is used to trace the net proceeds of any cargo or consignment sold upon commission.

An account sales generally occupies two pages, with a preamble over both, setting forth the names of the goods, ship, and person, from whom the consignment is received. The first, or left-hand page, contains an account of the various charges incurred by the transaction, such as freight, custom, expenses of landing and selling, together with the brokerage, and factor's commission, both of which are charged on the gross amount of the Sales. Commission is sometimes charged on money advanced for duty, together with the gross amount of the consignment; and some factors likewise charge interest on all advances.

The second, or right-hand page, contains an account of the quantity, price, and amount of the goods sold, with the buyer's name, and the time of payment. The difference between this gross amount, and the charges, is the net proceeds; for which the factor gives his correspondent credit, and sends him a copy of the account sales, to which he generally signs his name, with the words Errors excepted.

In small consignments, an account sales may be comprised in one page, beginning either with the charges, or with the amount of the goods. The forms of these accounts are various, but all tend to the same object, that of ascertaining the net proceeds.
## The Cash Book

The cash book contains an account of all money transactions; it is kept in a folio form like the ledger, with Dr. marked on the left-hand page, and Cr. on the right. On the Dr. side is entered all money received, and on the Cr. all money paid.

The amount of these receipts or disbursements may be carried in one sum to the ledger, for every month, week, or day, according to the extent of the businefs; but monthly divisions are most general; and it is found convenient to transfer the cash book first to the journal, claffing articles of the same kind together.

The following cash book is formed from the waite and subsidiary books, by obferving those tranfactions where money is either paid or received, and entering them accordingly with dates, names, and other neceffary particulars. In real businefs, however, such tranfactions should be entered at the time they take place.

Separate columns are sometimes allotted in the cash book for money kept at different places; fuch as, at a banker's, at the bank, and at home. The banker's book is occafionally found useful in correffeting and abridging the cash book, which may be also abridged by the help of a petty cash book, containing an account of small charges on merchandise, and of other incidental expences.

The cash book sometimes contains accounts that need not be transferred to the journal; fuch as loans and accommodations, which are to be fon repaid; these may be entered ftort, and when settled, they, of coufre, balance themselves.
BOOK-KEEPING.

JOURNAL.

The journal opens with the inventory of stock; after which the subsidiary books are journalized separately, according to the following rules, and then such transactions of the waiting book as are not contained in any of the subsidiary books, close the journal for the month.

Rules for journalizing the Subsidiary Books.

1. To journalize the cash book.

For all money received, "Cash Dr. to Sundries;" for all money paid, "Sundries Dr. to Cash;" specifying particulars, and classing items of the same kind together. See p. 1. and 2. journal.

2. To journalize the bill book.

For all bills received, "Bills receivable Dr. to Sundries;" for all bills accepted, "Sundries Dr. to Bills payable;" setting forth names, numbers, and other necessary particulars. See p. 2. journal.

3. To journalize the invoice book.

The person, for whose account the invoice is sent, "Dr. to Sundries," viz.
  "To Merchandise," for amount of goods.
  "To Charges on Merchandise," for shipping, and other charges.
  "To Commission," for the factor's commission.
  "To Insurance," for premium of insurance. See p. 5. journal.

When several invoices are sent by the same ship, they may be arranged in columns, as in p. 5. journal; a method which promotes both accuracy and dispatch, and which might be also used with the invoice book in general, and with the sales book.

4. To journalize the sales book.

The person, to whom the goods are sold, is debited for the sales; and if they are sold for ready money, the account is entered accordingly in the cash book. Then,

"Sales (the ship's name, &c.) Dr. to Sundries."
"To Charges on Merchandise," for charges at landing, &c.
"To Interest," for interest, if charged on money advanced.
"To Commission," for the factor's commission.
"To A. B. (the consignor)," for net proceeds. See p. 4. and 6. journal.

The above titles vary in different houses; as "Sales of Cotton, Sugar, &c. per the ship, Dr. ;" "Merchandise imported, Dr. ;" and the charges on sales and invoices, viz. "Freight," "Convoy," "Duty," and "Customs," are most fully arranged under separate heads. But, however these modes and terms may vary, the principles and refult are the same.

Note. The pages of the different books are put in parentheses in the corners; and in the ledger the page of the journal, where the article is to be found, is inserted in a column next to the date; and the reference next to the money column shews the folio of the ledger where the second entry is made; but here there can be no figure for "Sundries," as the sundry accounts may occupy different folios; this is an inconvenience which can be only remedied by turning to the journal, where the sundries are specified, and where the folio of each ledger account is marked in the margin.

BOOK-KEEPING.

The rules already laid down in the introductory part will apply in all cases that can occur for posting the journal into the ledger: some further explanations, however, may be here useful with respect to new forms and arrangements.

In the following ledger the accounts are arranged in the same order as in the journal, except in folios 2, 3, and 4, where articles, which are often referred to at the same time, are continously placed, to save the trouble of frequently turning to the index. This method of classing accounts of the same description is found very convenient in extensive business; but in the theory of book-keeping it is more obvious and regular to follow the order of the journal.

When all the accounts are opened in the ledger from the inventory of stock, let the subsidiary books in the journal, for each month, be posted in the following manner:

1. To post the journal of the cash book.

Debit the cash account—to fundries, for the amount received.
Credit the cash account—to fundries, for the amount paid.

Then, for the second or double entry.

Credit each account separately—to cash, for the respective items received.
Debit each account separately—to cash, for the respective items paid.

2. To post the journal of the bill book.

Debit bills receivable—to fundries, for their whole amount.
Credit each person from whom they have been received—by bills receivable for their respective amounts. Again, Credit bills payable—by fundries, for their whole amount.
Debit each person for whom they have been accepted—to bills payable, for their respective amounts.

3. To post the journal of the invoice book.

Debit the person to whom the invoice is sent—to fundries, for the whole amount.
Credit merchandise, charges, commission, and insurance respectively—by the said person, for the respective items annexed to these terms.

When several invoices are journalized together in columns, (as in page 5 of the journal,) the whole amounts of merchandise, charges, commission, and insurance, are each posted in one entry. This arrangement not only saves labour and repetition in the journal, and affords checks against error, but it also greatly shortens and simplifies the ledger. Had those six invoices been journalized separately, there must have been twenty-four entries in the journal, and the same number in the ledger, which, by this method, are comprised in four.

4. To post the journal of the sales book.

Debit the person or persons to whom the consignment is sold—to sales (as the ship's name) for the amount. Credit charges, commission, interest, and the consignee by sales for the sums annexed to these titles respectively. Some merchants open also a general account of sales, to which they transfer the amounts of Dr. and Cr. sides of the day book.

When the other articles of the journal are posted, a trial balance should take place. This useful check may be applied either monthly, weekly, or daily, according to the extent of the business.

In making the general balance, the residue of funded property, houfes, lands, furniture, ships, or goods unfold, is let down at the first col.; but in real businesses, it is more correct and satisfactory to enter such balances at their actual value, and to debit or credit profit and loss for the difference between their present worth and prime cost. Such a valuation becomes necessary, when any change takes place in the firm of a house, or in the terms of copartnership; and in order, at any time, to make a true estimate of profit and loss, interest should be charged on all property as well as on debts.

Partnership accounts are made very obscure and perplexing in most old systems of book-keeping, though in real businesses no such difficulty occurs. The general practice is to keep the books of a joint concern as if they belonged to one person only:—to open a separate account for each partner like that of any other individual, and on closing the books to divide the profits and losses according to the terms of co-partnerships.

Remarks on the Ledger and Subsidiary Books.

As interest should be charged in the ledger upon every article, or debt, from the time it becomes due to the period of settlement, the operation ought to take place before the general balance, and the interest between the interest of the Dr. and Cr. sides of each account of the ledger should be carried back to the journal, making "Sundries Drs. to Interest" for the balance in favour of stock, and "Interest Drs. to Sundries" for the balances on the other side. These entries should then be posted to their respective accounts in the ledger; and it is common, at the same time, to insert a note in letters, and other small charges on merchandise.

The manner of inserting the balance, and profit and loss accounts, in the ledger, varies in different counting-houses. In some they are placed as in the foregoing specimen; in others, the particulars of these accounts are inserted at the end of the journal, and the sum total of each transferred to its proper place in the ledger; a method that is found very convenient in extensive business, where accounts in the ledger may be thus closed as the goods are sold off, which greatly diminishes the labour of the general balance.

Besides the subsidiary books already explained, there are various others peculiar to certain kinds of business; such as Books of Insurance, and Shipping Accounts. There are also several, the titles of which are sufficiently explanatory of their uses; such as the Order Book, Letter Book, Petty Cash Book, Diary, and Debenture Book. In some houses, a Stock Book is kept, which gives the quantity and price of each article bought and sold; thus serving as a substitute for real accounts in the ledger; a purpose which is sometimes effected by the Warehouse Book. It should be observed, that the Account Current Book is universally necessary, as it shows the state of each personal account in the ledger drawn out in a detailed and simple form, in order to transmit a copy or duplicate of each person's account to him at the period of settlement.

Factorage and Exchange Accounts.

When a merchant and his agent or factor reside in countries where different currencies are used, the factor keeps his employer's accounts in the currency of his own country, and the employer, that their books may agree, keeps the same accounts in the same currency; but he also allows an adjoining column in his ledger for the corresponding value in his own money, by which he ascertains what profits or losses may arise from the fluctuation of exchange.

In order to explain such an exchange account, the following has been selected from the ledger of a London merchant, who (as appears by the statement) remitted bills to his factor at Hamburg, and drew upon him for his reimbursement or return; he therefore debits his factor for the remittances, and credits him for the drafts; the different amounts are first entered in the inner columns in banco marks, and then in the outer columns in sterling, according to the rate of exchange at which they were negotiated, and hence arrives the profit or loss; thus, if the merchant buys the bills which he remits at a cheaper rate of exchange than he sells the drafts which he draws on his factor, there is a gain; but if otherwise, a loss. On the same principle, if he had paid debts which he owed, or received debts due to him at a more advantageous rate of exchange than those debts were contracted for, there would have been a gain, but a loss if the contrary.

An exchange account is balanced by first comparing the inner columns; and when they are equal, there is nothing due from one party to the other. The difference between the outer columns is profit and loss; but if the inner columns be unequal, the balance is what one party owes to the other, which must be carried to the outer column at the

Vol. V.
current rate of exchange, and then the difference between
the outer columns is the profit or loss.

The letters M (my account) are used by the merchant
in keeping the account which his factor likewise keeps, who,
in stating the same transactions, annexes to his employer's
name only (his account); and their ledgers are reversed
with respect to the Dr. and Cr. sides. Thus, the factor, in
his account of the following transactions, debits his employer
for the sums he had drawn on him, and credits him for the
remittances which he receives; and as all the bills were
drawn in marks (the money of the place where they were
to be paid), the factor has no concern with any other
money; therefore, he debits his employer for commission,
brokerage, discount, and postage, in marks, for which his
employer also credits him, and values those marks at the rate
of exchange which exists when the account is balanced.

There are other kinds of exchange accounts kept between
Cambists, or dealers in exchange, who reside in different
countries, and who agree to transact each other's business
(commission free), and divide the gains or losses. Such ac-
counts, like all other partnership concerns, require interest
calculations, according as one party may be in advance for
the other; this is the case when bills remitted are at a long
date, and drafts at a short one, or the contrary; but it fre-
quently happens that one party may be in advance for sums
which have not been received by the other party, who is
therefore only answerable for the advances in his possession,
and the interest on the remainder should be paid out of the
general profits.

These exchange accounts are kept by both parties accord-
ing to the following plan; and when they agree, the Dr.
hide of one account is equal to the Cr. of the other, and the
inner columns of one to the outer columns of the other, and
vice versa.

Book of rates is a book established in parliament, showing
at what value goods, which pay the duty of tonnage and
poundage, are to be reckoned at the custom-house. See Cus-
tom, Duty, Poundage, and Tonnage.

The book of rates annexed to the act of tonnage and
poundage made in the 12th year of king Charles II. was
subscribed with the hand of sir Harbottle Grimelone, then
speaker of the house of commons. An additional book of
rates of goods and merchandizes usually imported, and not
particularly rated in the former, with rules, orders, &c. was
signed by Spencer Compton, esq. speaker of the house of
commons, 11 Geo. I. c. 7.

Aliens used to pay a larger proportion than natural sub-
jects, generally called the alien's duty; now repealed by stat.
24 Geo. III. c. 13, called the "Confounding Act," all the former sta-
tutes, imposing duties of customs and excise, were repealed
with regard to the quantum of the duty; and the two books
of rates above-mentioned, were declared to be of no avail for
the future; but all the former duties were consolidated, and
were ordered to be paid according to a new book of rates
annexed to that statute. By the improvement of this sta-
tute, the duty upon the exportation or importation of any
article may be easily found, or the excise duty to which
any commodity is subject, in an alphabetical table.

Book-seller, a professed trader in books; whether he
prints them himself, or procures them to be printed by
others, for sale.

Book-sellers, among us, are the same with bibliopole among
the ancients, whose office was distinct from that of librario.
Petty dealers, or venders of small wares, like our publishers,
were more particularly denominated libelliones. At Rome,
the Argiletum was the mart of books, as St. Paul's Church-
yard, or Fleet-street, and Paternoster-row, have been among
us; whence that of Martial.

Argiletanus maxis libro atabera, cum tibi, parce liber, fermina nostra vacet.
Book-sellers are a kind of agents, or curators in the republic of letters: in many places they are ranked among the members of universities, and entitled to the privileges of students: as at Tubingen, Salzburgh, and Paris, where they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid on other companies.

Formerly the offices of book-sellers and printers were united in the same persons. Paper, and all other materials, as well as labour, were, in the infancy of the art, exceedingly dear; and, on the other hand, the purchasers of books were few, partly because the price of them was high, and partly because knowledge being left widely diffused, they were not so generally read as at present. For these reasons, many of the principal printers, notwithstanding their learning or ingenuity, became poor. The printers were, therefore, induced to give up the book-selling part of the business, and to retain only that of printing. Sometimes, indeed, there were rich people of all conditions, particularly eminent merchants, more especially in Germany, who catted books, which they fold, to be printed at their own expense. Thus Henry Stephens was printer at Paris to Ulric Fugger at Augsburg, from whom he received a salary for printing the many MSS. which he purchased. In some editions, from 1538 to 1567, he subscribed himself "Henricus Stephanus, illustris viri Halberdii Fuggeri typographus." In like manner, towards the beginning of the 17th century, a society of learned and rich citizens of Augsburg printed a great number of books, which had commonly at the end these words: "Ad inique pinus." Printing, therefore, thus gave rise to a new and important branch of trade, that of book-selling, which was established in Germany, chiefly at Frankfort on the Main, where is a street, confiding of several large book-sellers' shops, and called "Book-street."

Laube gives a list of learned book-sellers, most of whom were also authors. Of late days, book-sellers have drawn their business into less compacts, and leaving the labour of composing books to one set of persons, and that of printing them to another, content themselves with the gainful part; thus ministration to the republic of letters not with the head, or the hand, but the purse only.

In this view, they have been very important and useful agents between authors and the public; and have contributed, in no small degree, to the encouragement of genius and literary industry, and the spread of science. There are few authors, who have undertaken the printing and publishing of any work likely to be transmitted to posterity, without being connected with some book-seller or book-sellers, eminent in their profession.

The fairs of Frankfort and Leipzic are famous for the refort of book-sellers, not only from all parts of the empire, but Holland, Flanders, &c. They have each their shop or warehouse, over which is inscribed the name of some celebrated book-seller of former times: officina Elzeviriana, Frobeniana, Morelliana, Janseniana, &c. An acquaintance with the book-sellers' marks or signs, frequently expounded on the title pages of their books, is of some use; because many books, especially in the 17th century, have no other designation either of printer, book-seller, or even city. The uncius is the mark of Raphelengius at Leyden; and the same with a dolphin twilled round it, of the Manutii at Venice and Rome; the Arion denotes a book printed by Oporinus at Basle; the caduceus, or pegasus, by the Wechelius at Paris and Frankfort; the cranes, by Craneford; the compass, by Plantin at Antwerp; the fountain, by Valentin at Paris; the sphere in a balance, by Janson or Blaeu, at Amsterdam; the lily, by the Juntas at Venice, Florence, Lyons, and Rome; the mulberry-tree, by Moris at Paris; the olive-tree, by the Stephenses at Pari and Geneva, and the Elzevirs at Amsterdam and Leyden; the bird between two fountains, by the Frothenius at Basle; the truth, by the Comelins at Heidelberg and Paris; the Saturn, by Collinse; the printing-press, by Badia Ascen- smart.
well as the paper. Of this kind, Darmeles Lardarius is one of the most injurious. The mixture of the juice of wormwood, and other bitter ingredients, in the paste employed by book-binders, as an expedient for the security of books against the attacks of those insects, is of no utility. Mineral salts are recommended for this purpose instead of it, under an idea, falsely conceived, that insects in that case, would not prey upon them. Mr. Rederger, among other instructions to German book-binders, printed at Lippes in 1741, advises their making paste of Treacle instead of flour, if he wishes them to powder slightly the books, the covers, and even the shelves on which they stand, with a mixture of powdered alum and fine pepper; and is also of opinion, that in the months of March, July, and September, books should be covered with a piece of woollen cloth steeped in powdered alum. *Bibl. d'Hist. Nat.* t. v. 269. For the preservation of books from the depredations of the insects above described, it will be only requisite to attend occasionally to wipe and dust them, observing that the library be not kept in a damp situation. Wiping, and an exposure of the book to the heat of a good fire, will immediately destroy the mites contracted in the damp, and, of course, prevent farther injury from that cause of vermin. Corroborative powders, even arsenic itself, would be employed in vain for the destruction of the larva either of the *tinea*, or the *dermifles*; but the fumigation of tobacco, a close heat, like that of a bow oven, or the scent of camphor, will effectually destroy them. The latter remedy we are certain, from experience, to be excellent. Mulk might, perhaps, answer nearly as well; or, lastly, if alum be preferred, let it be sifted into the powder. When M. Rederger recommended his preparation of powder-alum, he did not seem to be aware, that if employed in a crude, unburnt state, it could produce no effect upon the insects intended to be destroyed.

BOOKING, among Merchants, &c. the making an entry of any matter in the journal. See *Book, Book-keeping,* and *Journal.*

BOOK, in the Sea-Language, a long pole employed in extending the tails of a ship, principally in moderate breezes of wind. Of these there are various kinds, according to the purposes for which they are intended. 

Booms, simply so called, are those employed in extending the lower tails when the ship is going large; which is done by putting one end of the boom into the hole of the tail, and the other end to a but against the side of the ship. These booms are obtained in their proper positions by means of ropes called gars.

*Driver-boom,* is that which is used in extending the lower part of the driver.

Jib-boom, is a spar run out from the bowsprit, and is, therefore, a continuation of it, in the same manner as the top-mast is that of the main. Upon this boom the jib, in square-rigged vessels, is let; and hence its name. In some vessels, the length of the boom is so much increased, as to carry a flying jib.

Main-boom, is that which serves to extend the lower part of the main-mast in vessels having only one main: in brigs, &c. it extends the lower part of the fore and aft main-mast, the upper part, in either case, being extended by a gall.

Spunker-boom, a boom projecting from the main-mast, considerably beyond the tail, by which a larger sail can be extended than by the common boom.

Studding-sail-boom, are booms run out from the yard arms, from which the fladdering-sails are suspended.

To *Boon-off,* is to pull anything away, as a ship, &c. by means of a rod or boom.

Boon also denotes a pole with a bush or balfet on the top, placed to direct ships how to flieer into a channel; otherwise called a beacon.

*Boom* likewise, is used, in *Marine Fortification,* to denote a cable or cables stretched athwart the mouth of a river, or harbour, with yards, top-masts, battlements, or spars of wood, lashed to it, and girded with iron hoops rivetted together and nailed to the spars, to prevent an enemy's entering. Such a boom M. Chatelet Renauld had with diligence and art prepared at Vigo, for the defence of the plate fleet lying there in 1522; but how strong it was, it was forced by Vice-Admiral Hayton. on the Tuscan.

To lay a boom, provide a great number of wooden battings, or spars, of about 20, 30, or 40 feet length, and between 5 and 10 inches diameter; then moor two boats, having a fleet-anchor in each, in the place near one side of the river where it is intended the boom shall begin; bend two cables to these anchors, and round them place the spars or poles, frapping on each with battlement, or with four-inch ropes, until the boom is 7, 8, 9, or 10, or more feet in diameter, according to the hands employed, the cables being in the middle: then, with iron hoops rivetted together, warm the boom, and drive through the hoop a nail into almost every spar. After having wrought a good birth for the anchors, drop them, and continue the work till it is brought near the other edge of the river, and there drop two anchors more, with the cables bent to them. After all the spars yards and top-masts, with the top-chains, so far as the channel goes. To that part of the cable in the boom, over the channel, let two or more cables be fastened, and bent to anchors laid down the stream; over the clinch of these cables let batttings or spars be wrought for near 15 fathoms down the stream, that the enemy may not cut these cables. There will be serviceable when the enemy's ships come “remlings” against the boom; for if he force it in one place, the whole will not be opened by that fracture. In places where wood is scarce, and spars cannot be readily procured, or in cases where there is not time enough for preparing them, it may be sufficient to would two cables together with old ropes, lathing to them the oars, top-masts, and yards, and worming the whole about with iron hoops; and let every part be well “payed” with pitch, and small gravel smeared in it while the pitch is warm. A boom so prepared cannot be easily cut. The boom should generally be so contrived, as to open at one end for the passage of vessels; and there are several ways of doing this. One is, to clinch one end of the cable to an end of a large mooring-chain, the other end floating with a buoy, and this enmeshed to the ring of an anchor by a shackle. The chain being loosed from the anchor at the cbb, with a lack hawser fixed to it, the boom will swing down the stream daring the cbb; and, upon the flood, the boom may be re-laid, if the enemy appear in sight, which he must do at the first of the tide, for, if in the cbb, there is no danger of his coming; because, if the wind is right in, a prudent enemy will not venture against the tide, a ship then making fresh wind crewage; and should the ground, the main lie there till flood, which may prove fatal to her from the batteries ahere; and, against both wind and tide, the enemy cannot come in. On the contrary, should the boom be carried up the flood, and the enemy appear at the beginning of the next flood, the boom cannot be re-laid till the cbb, and before that time the enemy may have accomplished his design. If access can be had to plenty of timber, a “flockado” may be made, by driving several rows of piles in the channel before the boom; or, if the depth of water should not allow of this work, the trees may be usefully applied in making a raft to ride before the boom by good anchors, so that the cables be made too fail for the enemy to cut them. These rafts may be of singular use, by making fires on them, when the enemy appears, which will produce a conflagration, that may cause him to chop to anchor, and lose time, or his tide;
and this may be done each flood, observing not to have the smoke drive into the works, which might give the enemy too great an advantage.

To lay a boom in a straight channel. If the wind for the most part blow obliquely across the river or channel, on the starboard quarter going up the river, and the boom be laid directly athwart the channel, which was the case at Londonberry in 1639, when it was forced, the ships coming with the tide of flood, and a leading gale, will run fillings against it; and possibly break it, by curling with a direct force; whereas, if the boom could be laid obliquely athwart the river, nearly in a line with the wind, so that the ship must take it with her bow, the blow would be diverted by the ship's cutting, because, in this position, the enemy cannot run fillings against it; for, in coming up the river, the ship must be near before the helm; and to bring her head to a boom laid obliquely, the helm must be put down, and then it will be a great chance if he comes to so nicely as to take the boom; besides, mistakes may be committed in the confusion by the man at the helm, and by him upon the land, and by reason of the smoke; and, exclusively of all these, it may be taken for granted, that the ship would cast along-side the boom; and then the batteries at the end of the boom on the larboard side would rake it fore and aft, while the opposite batteries on the starboard side, playing on the broad-side with double-round and partridge, must make a great slaughter among the men cutting at the boom. And if it should not swining along-side the boom, but lie fillings against it, the batteries on the starboard side of the river, which are to be made above the weather-end of the boom, will rake it fore and aft, while those on the larboard side play on its quarter, or broad-side. The ships within the boom, protected by it, should be moored in a kind of half-moon, with their broad-sides blanking the boom: and several old, or, at least, unfixed ships, may be sunk, as soon as any signal is given from one of the forts, signifying that the boom will be cut. For this purpose, those ships should have large scuttles ready cut; and, for a further security, it would be very proper to have a small boom to divert the enemy, that the ships may be sunk in the channel before he boards them. The chief strength, however, is in the boom: and if a double, triple, or four-fold boom, were laid, provided materials could be procured, and the value of the shipping and cargoes warranted the expense and labour, it would make the place so much the stronger; and the enterprize of the enemy more hazardous. In stretching these booms, the trouble of many anchors may be spared, by making all the cables fall to the first, and so let them float in a hight, and by a small anchor ride upon the cbb, to keep clear of one another.

To lay a boom in the bend of a river. From the point formed by its end, stretch two booms across the channel, one towards the middle of the opposite bight, and the other so much higher, as to lie directly athwart the channel, leaving a kind of angular space between them. Next the point from whence the two booms stretch, erect a proper fort or battery, to command the channel below and above the bend. On the other side of the river, erect another fort or battery against the bight a little above the end of the lower boom, and fo dipose, that its cannon may rake the channel coming up, as well as command both the booms. From such a disposition, it is a great chance if a ship answer her helm so exactly as to time, in bearing or loosing about the point, as to take the boom fillings; and if she fit it with her bow, she calls; and, in either case, she will be raked fore and aft by one fort, and have her broadside battered by the other. Let seme old vessels be fitted up for fire-ships, and placed between the two booms; for each ship let two hawser be carried ashore, one on each side, and fixed to crabs, or capstans set up; so that as soon as the enemy has passed the first boom, these ships being set on fire, and heaved in their way, nothing can hinder the enemy's destruction. The ships to be descended may be moored in a half moon, with their broad-sides so laid as to batter the enemy when he attempts the boom. When no strong attacks by land are to be feared; the mooring of ships behind a point is well, on account of laying the boom. If the boom should be forced, which must be upon the flood, a fire-ship, instead of falling on board a boom thus moored, will, by the tide, be hurried beyond her; and if the pace be favorable to the ships moored there, it will be found impracticable to board a boom thus moored, with such a wind and tide as the enemy must have to break the boom, unless he expose his boats in carrying out an anchor to ramp over, which will be a very dangerous attempt, or some unaccountable accident intervene.

BOOM, drift, any yard, spar, &c., by which a boat may ride them on to the sea in a gale of wind, and drive to leeward. The usual method is to make fast a rope, about twice the length of the spar, to each end of it, and to the middle of the spar the boat-rope is to be bent. By this contrivance, a boat, in a gale of wind, will drive them on to the sea, and the drift-boat will prevent the sea from breaking over the boat. See BOAT.

BOOM-irons, in a Ship, are two flat iron rings formed into one piece above the other, employed to connect the booms to the yards, &c. ; the lower ring is the largest, and is driven on the yard. Some boom-irons fasten on the yards with a crotch or flasp, secured by nails and hoops.

BOOM-Tackle. See Tackle.

BOOM, in Geography, the principal place of a canton, in the department of Deux Neuthe, and district of Anvers. The place contains 3428, and the canton 14,519 inhabitants. The territory comprehends 9325 kilometres and 11 communes.

BOOM-channel. See BRANDARIES.

DOOMAZOOSE, a river of Africa, in the province of Confantina, which bounds on one side the plain, in which are found the ruins of the ancient Thubans, now Tuban; and the river Barcehok bounds it on the other side.

BOOMBANI, a town of Africa, in Ludamar, north-east of Jarra, and north-west of Benown. N. lat. 15° 10', N. long. 7° 12'.

BOOMITES, a term used by some authors to express a kind of agate, of a very remarkable brightness and transparency, which represents the figures of shrubs, trees, mosses, &c., in the manner of the Dendrice, a common mocho-fole. This is, however, very different in the degree of transparency and brightness.

BOOMKIN. See BUMPKIN.

BOOMLAND, or Lualand bank, in Geography, is the second bank from the shore, ending nearly against Nienport, on the coast of Flanders, betwixt that and Oftend. Between that and the first bank, called the Greer, a channel of eight or nine fathoms passes through. All the banks begin off Oftend, being four, and what are called the Flemish banks.

BOOMOE-Olle-Sando, a small island near the coast of Norway, 12 miles W. of Suroy.

BOOMUGGAR, a district of Africa, in the province of Confantina, which is very fertile, and bears several traces of ancient buildings.

BOON, in Ancient Geography, a port of Cappadocia on the Euxine, between Cotyora and the promontory of Jason, according to Ptolemy.—Allo, a village of Ethiopia, near the Nile, and on the west side of it.
Booingsland, in Geography, an island of America, on the coast of the district of Maine, between the mouth of York river and Cape Neddock.

Boon's Creek, a small north branch of Kentucky river.

Boon's Point, the most northerly point of the island of Antigua. N. lat. 17° 7', W. long. 63°.

Boondy, or Bonner, a town of Hindostan, in the country of Aigumere, 84 miles S. E. of Aigumere, and 65 S. S. W. of Rantamurp. The town is situated on the southern declivity of a long range of hills, which runs nearly from E. to W. The palace of the rajah, a large and finely built of stone, is about half way up; and a kind of stone fortification runs to the top of the hill. The pass through the hills lies to the end of the town, and is secured by a gate at each end. The pilgrims of the rajah of Bondee have been reduced by the irritations of the Maharras, and encroachments of the Kotha family, to the revenue of his fiefs, of which a fourth part, or chout, is paid to the Maharras.

BOONE Bay, lies on the western side of the island of New-foundland, 22 leagues N. by E. from St. George's harbour. N lat. 49° 37'.

Boonen, Arnold, in Biography, a portrait painter, was born at Dort, in 1669; and after having been for some time a disciple of Arnold Verhas, placed himself under Godfrey Schellten, who recommended him, after having received his instructions for six years, to study nature. By following this advice, Boonen obtained the reputation of a great master at the age of 25 years. His style of colouring was extremely good; the attitudes of his figures were elegantly diffused; his touch neat. The whole poss. had such a harmony, and his portraits maintained such a striking likeness, that he was ranked among the ablest artists of his time. He had a number of admirers, and a demand for works which he was unable to execute. He had the honour of painting the portraits of the czar of Moscow, of Frederick I. king of Prussia, of the viceroy of the duke of Marlborough, as well as of many of the princes of Germany, and most of the noblemen who attended the czar. His health was impaired by his excessive application, and he died rich in 1729. Pilkington.

Boonerschians, in Geography, a fortress of Groningen, on the borders of East Friesland, a league from Dollart bay: 5 leagues S. of Embden.

Booneton, a small post-town of America, in Suf{ county, New Jersey, on the post-road between Rockaway and Suf{; county hot; : 116 miles from Philadelphia.

Boonsborough, a town of America, in the county of Madison, and state of Kentucky, seated at the mouth of Otter creek, 32 miles S. E. of Lexington, and as far N. E. from Danville. N lat. 37° 57'.

Boon-Ork, or Long-Neck, in Ornithology, one of the names of the little Bittern, Ar dedication. Buff. Alp. Roopflathmus, derived from boa, an ox, and post; ox; eye, Ox-eye snake, in Natural History, a name given by Schenckner to a peculiar gate, in which there frequently appear circles of considerable size, resembling those immense animal's eye. The ground colour of the snake is grey, and the circles of a deep bluish black.

Boops, in Lxicology, a species of Sphex that inhabits Germany, in the environs of Vienna. It is of a black colour, with three segments of the abdomen, and the tarso of the legs tawny. Schrank. Inf. Auct. — Obs. The eyes are large, the abdomen ovate.

Boors, in Ichthyology, a species of Laurus, found in the seas about Japan. It is specifically distinguished by having the lower jaw rather longer than the upper one, and having two fins on the back. Houtioga a9 Haart. The eyes of this fish are very large; the teeth in the lower jaw large and acute.

Boors, a species of Sparus, of the lineated kind, found in the Japan seas. The body is marked with obscure longitudinal lines, of which the four lowest are gold and silvery. Artedi describes this fish. Geol.

Boors, in Zoology, the specific name of the Pike headed bot; Balena, boors, of Laurus. It is distinguished by having double spiracles on the snout, and a hony protrusion at the extremity of the back. Linn. This is the Jupiter fish of Anderson; the French name it la Jubarte.

The pike headed whale is a native both of the northern and southern ocean, and grows to the length of forty or fifty feet, and sometimes more. The body is round, especially towards the head, from whence it tapers gradually to the tail. The head is large, and of a somewhat lengthened form, though terminating in an obtuse tip. Before the nostrils are three rows of circular convexities, the utility of which has not yet been ascertained. Above thence is the double spiracle through which the animal ejects the water in the same manner as the other whales. The eyes are situated beyond the spiracles on each side of the head. Just behind the orbit of the eyes are the ears, the apertures of which are scarcely perceptible. In the upper jaw are numerous laminae of black whale-bone, not above a foot in length. The tongue is large, fat, spongy, and furnished with an appendage towards the throat, a kind of bough skin like an opoquon. The lateral, or pectoral fins are large, oval, entire on the posterior edge, but rounded and emulated on the front. The dorsal fin is of a fatty-cartilaginous substance; it is placed on the hind part of the back, above the vent, in a position nearly pendicular. The tail, which is horizontal, is divided into two lames, both of which are pointed at the extremity. The spines below the pectoral fins, together with the anterior part of the belly, is deeply wrinkled with a number of longitudinal plaits, or furrows, which may be contracted or dilated at the pleasure of the animal. All the upper parts of this kind of whale are of a dark brown, or black colour, obscurely marbled; the prevailing colour beneath is white, except the furrows between the abdominal plaits, which differ as the animal opens its mouth and then appear of a bright red.

This is represented as a very timid creature. There are occasions, however, in which it has evinced a considerable share of courage, such as being armed on the shore in a storm, when it has been known to defend itself with great vigour, and do no small mischief before it could be overcome. When the male has been armed with the female, of which influences do sometimes occur in the north, they will defend each other with uncommon spirit, emitting at the same time a most horrible grunting noise, somewhat similar to that of a pig when flour for killing. Its greatest enemy in its native element is the phylater microps. This species lives principally on the Balmo arcticus, the ammodytes tobianus, and on the teataceous, and other vermes. Its flesh and oil are used like those of other whales. The Greenlanders, where those animals are most frequent, call this particular kind keporkse.

Boors, in Geography, the appellation of a very numerous class of the inhabitants of Alaska, usually called simply boors, but more accurately denominated vaffal-boors, in order to distinguish them from the free boors, or free peasants. Thlese latter, though often comprehended among the boors in state papers, and in the enumeration of the people, are really of a different class, and form a kind of middle station between theburghers and the vaffal-boors. In virtue of their freedom, no man can alienate or fell them; they educate their children as they please; most of them possess immo-
moveable property: what they own cannot be taken from them, provided they duly pay their common taxes, or perform their fixed tasks of labour; nor are they under any arbitrary command, but, like those of superior rank, own no authority besides that of the general laws of the state. Among these, however, there are various gradations, as all of them do not enjoy the same degree of liberty. Some are expressly called boors, and without violation of their freedom are treated as such, though with somewhat more gentleness than vaftals. Others possess true civil liberty, and differ only by their place of abode and customary occupations from town's people. To this class belong the foreign colonists, settled here as husbandmen or farmers, so that by their occupation they are boors; but on account of the land which they possess, this appellation does not justly belong to them. To the free-peasants we may also refer the "Onondoverzi," as they are called, or one-horse owners, whose persons are free, and who possess their houses with the lands belonging to them, as real property, for which they neither perform feudal services nor give any of their products: but they are obliged to furnish recruits, to pay the pole-tax, and obrok, and they are not allowed to buy villages nor to possess vaftals as property. The kozaks, or cossacks, in all their persons and branches, the tartar tribes, the bashkirs, volgues, kalmancks, with most of the nomad tribes, and people of the steppe, possess their lands as real and heritable property, and therefore belong to the same class of free-peasants. This is also the case with respect to disbanded soldiers, who live in the country, emancipated serfs, who have either bought their freedom of their lord, or obtained it gratuitously in reward for faithful service; male-Russian boors, or boors of Little Russia, who are neither cossacks nor vaftals, but free people, and free-peasants, who belong to their land, and can neither be sold nor alienated separately from it.

The vaffal-boors, as distinguished from those we have now described, have no civil liberty: their children belong not to them, but to their manorial lord, on whose will they depend; they also, with their children, fingly or in families, may be alienated, sold, and exchanged; they possess no immoveable property, but they themselves are treated sometimes as the moveable, sometimes as the immovable property of another. These boors were originally free, but in Great Russia they became gradually vassals, or heritable serfs. They are commonly divided into three kinds; but it will be more convenient to distribute them into four classes. The first consists of "crown-boors," called vulgarly, in Livonia, public-boors; who are very numerous, and are the people belonging to the crown. It is necessary, however, to distinguish between boors whom the crown can grant away, as its real vassals, and who possess no real property, and those tribes of people who are owners of immovable possessions, and enjoy certain rights and privileges. But there are, exclusively of these real vassals, boors belonging to the crown, whom the crown cannot with propriety give away, being attached as workmen to the mines, either of the crown, or of private individuals. Most of the crown-boors pay, besides the head-money, the obrok, i.e. a sum of money for every male soul, and this is the only benefit which the crown derives from them. In some districts they do task-work, or pay of their products; or, in Livonia, they do both instead of the obrok. Among these there are some that are not only in good circumstances, but even rich; nor would they be acceptable of their vassalage, if the crown did not possess the power of granting them away. Boors of this class are mentioned under several denominations; as boors of the black plough, boors of the empire, imperial boors, petty-boors, and court-boors. In the Russian laws and ukases, the following eight distinct kinds of crown-boors are mentioned, viz. empire-boors, who belong neither to the crown, nor to the nobility, nor to the monasteries, but are members, or burgheurs of the empire; imperial boors, who belong to the monarch personally, or rather to the court; boors of the black plough, inhabiting a great part of the northern Russia, as far as Archangel; poll-boors, who are bound, in lieu of the impolts, to keep poll-boors; court-boors, whose service and tributes are defined to the support of the imperial court; monastary-boors, who formerly belonged to the monasteries, but now every where in Great, Little, and White Russia, are under the kamar-a-hofs; economy-boors, who in Great Russia were those boors who, about the year 1764, were taken from the monasteries and churches, and made subordinate to a particular college of economy, established for that purpose, but now abolished, so that the boors are under the kamar-a-hofs, retaining their former name; and petty tribute paying boors, who deliver their tribute in peltry or furs. One privilege of the crown boors consists in this, that they may buy of noblemen villages and lands, with the vassals belonging to them.

The second class of crown-boors bears the denomination of "crown-boors," who belonged formerly to the bishop, churches, and monasteries, but were taken from them in the year 1764; they are much the same with those of the crown-boors already mentioned, paying particular taxes, and enjoying certain privileges. The boors of the third class are, "boors of the mines," who can never be separated from particular mines, and can never be sold or exchanged apart, though they are transferrable with the works to another master. The fourth class comprehends "able, or private-boors," the condition of these depends very much on the humour or caprice of their lord; nevertheless, those of them who belong to wealthy lords, requiring neither task-service, nor deliveries of products, and contenting themselves with a moderate obrok, live happily, grow rich, and would hardly exchange their condition with that of many who enjoy nominal freedom. However, the dues from these boors to their lord are settled by no laws; some pay the obrok, others perform task-service, or, in lieu of it, deliver certain portions of their natural products; from others all these are demanded; but the obrok alone, where the lord is rich, is the most usual. Many take for every male head only three, others five, and some from the most opulent of the boors, twenty-five rubles, or even more. Those, who bear the work, are the private boors, who are obliged to perform task-service, in lieu of the obrok, at the mines-works of their lord, which may be at a great distance, and with respect to whom the distance is not considered. The late emperors declared it to be her wish and inclination, that vassalage should be abolished; or at least, that the condition of the boors might be ameliorated, and all oppressive abuses restrained. She actually adopted several measures for accomplishing her benevolent wishes, by instituting a regular tribunal for the boors, entirely chosen out of their own body; delivering the boors at the mines from oppression; appointing overseers and guardians to prevent every species of violence; and on every occasion recommending gentleness and humanity, of which she herself is said to have exhibited an illustrious example. Under her administration influences occurred of noblemen, who were brought to a severe account for cruelties exercised on their vassals. The most usual mode by which a vassal becomes such is, by being born of a vassal.

By the common law of Livonia, every child born of an unmarried female vassal belongs, without regard to the father, to the estate on which it is born. Peter I., however, by an ukase,
The thirteenth Geography, the Inhabitants, and the Products of various Countries, with a View to their Identification and Classification. The Rufia people, indeed, may soon become rich, as he understands the art of turning every thing to profit, and of being content with a little; for his clothes cost him nothing, being wholly manufactured at home, and with his diet, which, during the long half, is extremely meagre, he is supplied from his husbandry.

The value of an estate in Rufia is estimated principally by the number of male boors belonging to it. The national lombard, in all mortgages, which it accepts, takes the boor at forty rubles; but in the sale of an estate they are seldom or never estimated at so low a price. In the government of St. Petersburg every soul is paid for, according to the quality of the estate, from 200 to 300 rubles: in other parts of the empire the price is commonly much lower, but at present hardly anywhere under 100 rubles. On many estates the boors work three or even four days in every week for the lord. The boors enrolled to the mines have their labours affected by an edict issued in 1782; and those belonging to the crown-mines have always experienced a milder lot, as the crown is always interested in their preservation. According to the enumeration of male inhabitants, made from 1781 to 1783, in the forty one vicerealties of which Rufia at that time consisted, the number of crown boors was 4,674,003, and of private boors 6,678,239. Tooke's View of the Russian empire.

BOOSHA, a river of Africa, in the empire of Morocco, near Tetuan, where the Morocco galleys anchor and winter, under the protection of a bad fort.

BOOSURA, in Ancient Geography, a small town of the isle of Cyprus, towards the north-west, between Curtum to east, and Palae-paphos to the north-west. It is mentioned by Strabo.

BOOT, a leathern cover or defence for the leg, used chiefly on horse-back, both to keep the body more firm, and defend the part from the injuries of the weather. Boots seem to have been called thus from their resemblance to a sort of jack, or leathern bottles, formerly in use, and called botta, in the old French boots. Borel derives the name from the ancient French word bot, a stump, because the boot gives the leg this appearance.

It is not long that the boots used on horse-back have been called by this name. In the reign of Charles VII. of France, they were called bottes, boe.

The ancient monks usually wore boots; that is, the denomination of botta, or botas, was given to their slippers.

The Chinese had a kind of boots made of silk, or fine stuff, lined with cotton, a full inch thick, which they always wore at home and abroad.

There are also chirurgical boots, for the cure of varicose veins, or crooked and distorted legs.

The boot was much used among the ancients, by the foot as well as borromen.

The boot is the same with what was called by the ancient Romans, oreas, in middle-age writers, grea, gamberis, lainberga, lumbarga, or lumberta. Du Cange Lat. Gloss.
The boot is said to have been the invention of the Carians; it was at first made of leather, afterwards of brass and iron, and was proof both against cuts and thrusts. It was from this that Homer calls the Greeks brazen-booted. Plin. Hift. Nat. lib. vii. cap. 56. Homer. II. vii. v. 44.

The boot only covered half the leg, some fay only the right leg, which was more exposed than the left, and it being advanced forwards in the attack with the sword; but in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts, or missile weapons, advanced the left leg foremost; so that this only was booted. Veget. lib. i. cap. 20. Prifc. Lex. Ant. tom. ii. p. 309. and Aquin. Lex. Mil. tom. ii. p. 102.

Boots, j ebings, are a thick strong sort used in dragging ponds, and the like. Hunting-boots, a thinner kind, used by sportsmen. Jack-boots, a kind of very strong boot, used by the troopers.

The boot is now diffused in England; but it abounds still in some other countries.

Boots, Nigant, in Geography, the most westerly of some small islands, about 3 leagues on the north of Cajana, or Cayenne, opposite to the river so called, on the eastern coait of South America.

Boots, lords, a wooden cylindrical instrument, used by shoemakers for widening the leg of a boot. It is flit in two parts, between which a wedge is driven when it is put into the boot.

Boots, top, that part of the side of a ship which is contained between the light water mark and the lower edge of the wales. This part is commonly painted white, and, in that case, the flot is said to have white boot-tops. Boots, Nigant, See Boot.

Boots, Nigant, in Sea Language, the act of cleaning the upper part of the ship's bottom, or that part which lies immediately under the surface of the water, and daubing it over with tallow, or with a coat or mixture of tallow, sulphur, resin, &c.

Boots, Gerard, in Biography, of a noble family, was born at Gorcum, in Holland, in 1604. After taking his degree of doctor in medicine, he came to England, and was in such estimation for his skill in his profession, that he was made physicin to king Charles I. On the death of that prince he settled in Dublin, but died soon after, viz. in 1650. In 1650, he published "Heures de recreation," 4to. in the Dutch language; and in 1640, "Philosophia naturalis reformata," which are not however much esteemed.

Boots, Arnold, brother to Gerard, and of equal celebrity with him, was well versed in the Latin, Greek, Hebrew, and Syriac languages. After taking his degree of doctor in medicine he came also to London; but on the breaking out of the troubles here, he removed to Ireland, where he practised with success and reputation for some years. Tired at length with the hurry and confusion incident to civil commotions, and having experienced some losses, he went to Paris, and there passed the remainder of his life in retirement and study. He died in 1653. He published, in 1649, "Observations medicinae de affectibus et veteribus omniis," 12mo. Haller gives a particular account of this volume, which contains many interesting and curious observations. Haller Bib. Med. Elov Dict. Phil.

BOOTAN, in Geography, a country of Asia, occupying an interval of at least a degree of latitude, according to Mr. Rennell, between Bengal and Tibet. Tibet and Bootan are often confounded together; but the latter is a feudal, or independent province of the former, and borders on Bengal.

The capital of this southern province of Tibet is Taffaudon, in N. lat. 27° 45', and beyond this is Paridrong, supposed to be in 28° at least, though placed by the map of the Lamas in 27°. This place, and the chain of mountains near it, have been regarded as the common boundary between Tibet and Bengal; but Mr. Boyle, who was sent by Mr. Hattersly on an embassy to the grand Lama of Tibet, in 1744, affirms us, that Paridrong is the frontier town of Tibet towards Bootan, and not towards Bengal. The western limits of Bootan have not been ascertained by Mr. Turner, to whom we are indebted for a particular account of this country and of Tibet in general. From Mr. Huxley's journey to Siringapur it would seem, that the name of Bootan includes most of the south of Tibet, particularly those regions which are omitted in the doubtful map of the Lamas, who, in their account of these frontiers, use Chinese or Tartar terms, or, perhaps, invented appellations equally fictitious, as they are alike unknown to the Hindoos and the natives. Bootan is a very mountainous district. The southernmost ridge of its mountains rises near 1 1° mile perpendicular above the plains of Bengal, in a horizontal distance of only 15 miles; and from the summit, the astounded traveller looks back on the plains, as on an extensive ocean beneath him. Through this ridge there are not many passes, and all of them are fortified. The road between Bengal and Taffaudon lies chiefly over the summits of stupendous mountains, or along the borders of craggy precipices; so that it is difficult to ascertain the direct distance. Between Taffaudon and Paridrong is a chain of mountains full higher than the others; they are visible from the plains of Bengal at the distance of 150 miles, and are commonly covered with snow. These are a continuation of the mountains Emodus and Paraparnicus of the ancients; and are sometimes by the moderns erroneously called Caucasus. In the Lamas' map, they are called Rimola, and by the people of Hindostan Himmaleh. Mr. Rennell supposes them to be, in point of elevation, equal to any of the mountains of the old hemisphere. Bootan, however, with all its confused and shapeless mountains, is covered with eternal verdure, and abounds in forests of large lofty trees. The sides of the mountains are improved by the hand of industry, and crowned with orchards, fields, and villages. It has not many wild animals except monkeys, and a few peacocks. From Mr. Turner's journey, in 1783, we learn, that Bootan does not, probably, contain any metal except iron, and a small portion of copper. The climate of this province may be considered as temperate when compared with that of Tibet Proper; and yet its winters are very severe. The people of Bootan are said to differ essentially and radically from the Hindoos, and to have differ so as to resemble the Chinese; whence it may be concluded, with some degree of probability, that they belong to that grand race of men, which approaches the Tartars, though they cannot be regarded as Mandarins, Mongols, or Tartars proper. See Tibet.

BOOTES, in Astronomy, a constellation of the northern hemisphere, being one of the 48 old ones; whose stars, in Ptolemy's catalogue, are 238 in Tycho's 28; in Bayer's
Booth, Henry, in Biography, earl of Warrington, and Baron Delamer of Dunham Massey, an upright senator, and distinguished patriot, was defended from a family of great antiquity, and born in 1651. During the life of his father, he was Cuiitos Rotulorum for the county palatine of Chester, and represented that county in several parliaments during the reign of Charles II. His zeal for the protestant religion, and for the liberties of his country, was conspicuous at an early period of his life. He was active in promoting the bill for excluding the duke of York from the throne; he also made a spirited speech in support of frequent parliaments, and against governing by favourites; and he opposed, with a manly firmness, the unjust and arbitrary power assumed by the privy-council, of imprisoning men contrary to law. He was anxious likewise for preferring parliament uncorrupt; and with this view contended for an act to punish those who had received bribes from the court, as members of the parliament denounced the penison-parliament. He also spoke in parliament against the corruption of the judges, charging them with having sold, denied, or delayed justice, and recommended an inquiry into their conduct, and that those who were found guilty might receive merited punishment. His zeal against the papists, and his vigorous opposition to the arbitrary measures of the court, rendered him particularly obnoxious to the governing powers; so that he was turned out of the commission of the peace, deprived of his office, as Cuiitos Rotulorum of the county of Chester, and committed close prisoner to the tower of London, from which, however, he was after a few months released. After the accession of James II. he was twice committed to the tower; and in the beginning of the year 1686, brought to trial, under a charge of high treason. Judge Jeffries maintained, on this occasion, that it was not necessary, in point of law, that there should be two positive witnesses, in order to convict a man of treason; and that if there was only one positive witness, additional circumstances might supply the place of a second. Lord Delamer, who came to the title in 1652 by the death of his father, made an able defence; and was unanimously acquitted. From this time he lived in retirement at his seat at Dunham Massey; but when matters became ripe for the revolution, he exerted himself in the promotion of that great event. In a note to Dr. Aiken's ode addressed to the earl of Huntington, it is said, that at Whittington, a village on the edge of Scarf holy in Derbyshire, the earls of Devonshire and Danby, and the lord Delamer, privately concerted the plan of the revolution. The house in which they met is at present a farm house; and the country-people still distinguish the room where they sat by the name of the "plotting parlour." Lord Delamer appears to have been one of the first who took up arms in favour of the revolution. After he had joined the prince of Orange, he was deputed, in December 1688, together with the marquis of Habsiax, and the earl of Shrewsbury, with a message to king James, intimating to him, that he must remove from Whitehall. To the respectful manner in which he executed this commission, James bore testimony, after his retirement to France; observing that "the lord Delamer, whom he had used ill, had then treated him with much more regard than the other two lords, to whom he had been kind, and from whom he might better have expected it." His lordship, however, was fully convinced of the necessity of dethroning the king; and in a debate, relative to declaring the throne vacant, he said, that "it was long since he thought himself abjured from his allegiance to king James; that he owed him none, and never would pay him any; and if king James came again, he was resolved to fight against him, and would die single with his sword in his hand, rather than pay him any obedience." Such were his services in support of the revolution, that he was honoured with several official appointments at that period. The offices of lord-lieutenant of the city and county of Chester, and of Cuiitos Rotulorum of that county, to which he was promoted, he enjoyed for life. Lord Delamer, however, seems to have been no favourite at court; his disposition did not seem to have been formed for a pliant courtier under any establishment; and with respect to his political sentiments, he seems to have been one of those who wished for more retrenchments of the regal prerogative than were made at the revolution. But though his lordship was removed from the administration, letters patent were issued, in 1660, for creating him earl of Warrington, in the county of Lancaster, to continue to him and the heirs male of his body; and a pension likewise of 200l. per annum was granted to him, for the better support of that dignity; but it is said, that this pension was paid to him only for the first half year, and afterwards suffered to run in arrear. On the 3d of January 1692-3, the earl of Warrington signed a protest against the rejection of the bill for incapacitating perfons in office under the crown, either civil or military, from sitting in the house of commons. This patriotic peer died at London on the 2d of January 1692-3, in the 42d year of his age. He left four sons and two daughters; but his second son dying in 1759, without heirs male, the earldom became extinct. Mr. Granger says, that lord Delamer was "a man of a generous and noble nature, which diffused, upon any terms, to submit to servitude; and whose passions seemed to centre in the love of civil and religious liberty." In every part of his life, indeed, he seems to have been actuated by the same principles; and in his "Advice to his Children," printed in his works, he says, "There never yet was any good man, who had not an ardent
ardent zeal for his country.” In private life, he was a man of strict piety, and of great worth, honour, and humanity. His works were published in 1694, in one volume 8vo. They consist chiefly of speeches made by him in parliament, prayers used by his lordship in his family, some short political tracts, and the caiue of William earl of Devonshire. Biog. Brit.

Booth, Barton, an applauded tragic actor, was descended from an ancient and respectable family in Lancashire, born in 1681, and educated under Dr. Dubby at Wettinster school. Whilst he was at school, he exhibited early indications of those talents which qualified him for his future profession; as, besides his fondness for Latin poetry, he was distinguished by the grace and energy with which he recited several passages selected from it and committed to memory. Flattered by the applause which he received in acting a part in a Latin play, performed at school, he acquired, or at least indulged, an inclination for the stage; and, eloping from school, at the age of 17, very much to the disappointment and grief of his father, who designed him for the university and the church, he accompanied the manager of an Irish theatre to Dublin. On the Dublin stage he performed for three seasons with very distinguished applause; recommending himself, particularly in tragedy, by a grave countenance, good person, an air of dignity in his aspect and manner, a fine voice, and a very manly action. Besides, he spoke very justly, his pronunciation was very correct, and the cadence of his voice was extremely grateful to the ear. The theatrical reputation which he acquired in Ireland, determined him to return to London in 1701; and being recommended to Mr. Betterton, he was treated by him with kindness, and had important parts assigned to him at his theatre. After the death of Betterton, he was received into the Drury-lane company, and, by his acknowledged abilities, he rose to the highest rank in his profession, as a tragic actor. When Mr. Addison’s famous play of Cato was introduced on the stage in 1712, as it is said, with political views, and to support the cause of the whigs, the part of Cato was assigned to Mr. Booth, and it was performed so much to the satisfaction of the house, that both the wigs and Tories of that period concurred in bellowing upon him most flattering and unprecedented rewards. On this occasion, it is said, that lord Bolingbroke made him a present of fifty guineas from the stage-box, and that the managers afterwards presented him with the same donation. By the patronage and influence of lord Bolingbroke, he was associated, in 1713, to the patentees of the theatre; and for twenty years conducted himself, both as a manager and an actor, with such distinguished integrity and abilities, as to secure the uninterrupted approbation of the public. He married for his second wife, Mrs. Santlowe, a favourite actress, with whom he lived in great harmony, and to whom, in token of his affection, he left his whole fortune, which, according to his own declaration, amounted to no more than two-thirds of what he had received with his wife upon the day of marriage. At length his health began to decline; but such was the high estimation in which he was held by the public, that his appearance drew together crowded audiences, whenever the intervals of his intermission permitted him to tread the stage. But his constitution rapidly decayed, and he sunk under a complication of disorders, May 10, 1753. He was buried privately, according to his own direction, at the parish church of Cowley, near Oxford, the profound place of his former retirement, and no monument was erected to his memory. His wife, however, who survived him forty years, caused a monument to be erected in Wettinster abbey, in 1772.

As an actor, Booth distinguished himself by that solemn dignity, and rotundity of declamation, which fayed to mark distinctly the cadence and melody of the verification. Without altogether neglecting the expression of passion, his manner seemed to have been better suited to poetical and sentimental parts, such as that of Cato, and the heroes of Rowe’s tragedies, than to the highly impassioned. Cibber, however, says, that the matter-piece of Booth was Othello, a character abounding with sudden turns of passion, united with elevated sentiment and striking imagery. There, says Cibber, he was more in character, and seemed not more to animate or please himself in it than his spectators. To his Cato he gives qualified praise, and he attributes the reputation acquired by it to several temporary and accidental circumstances; but in Othello, he adds, we may see him in the variety of nature. Mr. Victor hath taken pains to do justice to Mr. Booth, in opposition to the lukewarm praise of Cibber, and to the reflection contained in Pope’s epitaph of “well-mouhted,” and in the severe illustration of it by his right reverend annotator; and yet, perhaps, Pope’s epitaph, though invidiously employed, gives a just idea of his general manner.

As a man of letters, Booth appears in a respectable light; though his indolence prevented him from exerting himself much in this way. He translated some odes of Horace, and wrote several songs and other small pieces of poetry, which were well received; and he composed for the stage a mask, entitled “Dido and Eneas.” In his private character, he was just and upright; ready to acknowledge and reward merit wherever he found it; somewhat rough in his manner, and hasty in his temper, but frank and sincere in declaring his sentiments; kind and liberal in his conduct as a manager; respectful to his parents; affectionate to his brother and sister; and polite and generous to his friends and acquaintance. He was generally esteemed by those who knew him; and his death was much regretted. Biog. Brit.

Booth Bay, in Geography, a town and bay of America, on the coast of Lincoln county, in the district of Maine, about two miles west of Penmack point. N. lat. 43° 45’. The bay stretches within the land about 12 miles, and receives two small streams. On it is a town, having 997 inhabitants.

BOOTIA, in Botany (De Neck). See Saponaria Officinalis.

BOOTY, in the Military Art, the moveables taken from an enemy in war, which belonged to the conquerors. Among the Greeks, the booty was divided in common among the army, the general only claiming a larger share. The right of making a distribution of it was always considered as one of the prerogatives of the general. During the Trojan war, it was laid at his feet; one part he reserved for himself, and divided the remainder either among the chiefs or the soldiers. As soon as a victory was obtained, the armour was seized by the conquerors, or great commanders; and the common soldiers were permitted to gather the spoils of the dead. Homer, II, 428, § 66.

The Lacedemonians were forbidden to meddle with the spoils of the conquered; and the Spartans had always 300 men appointed to observe their actions. Inquests, however, occur of their dedicating part of their booty to the gods. When any booty of great value was taken, the soldiers presented their general or commander with it; but before the distribution of the spoils, they selected the best as an offering to the gods. Eight hundred years after the Trojan war, the generals regulated the partition of the spoils taken from the Perians, after the battle of Platea. They were shared among the soldiers, after setting apart a certain portion to decorate the temples of Greece, and decreasing proportional rewards.
words to those who had distinguished themselves in the action. From that time, the Grecian general disposed of the sums arising from the land of plunder; sometimes deducting them in the public treasury; at other times assigning them to defeat the expense of public works, or the decoration of temples; enriching them friends and soldiers with them; adding them to their own wealth; or at least appropriating them to themselves the third part, which in certain countries was regularly assigned them by constant usage. Polyb. 11. 18, p. 147.

By the military discipline of the Romans, spoils taken from the enemy belonged to the republic; particular persons having no right to them. The generals who procured themselves on their probity, carried it wholly to the public treasury. Sometimes, indeed, they divided it among the soldiers, to animate them, and serve in lieu of reward. But this distribution depended on the generals, who were to conduct themselves herein with great equity and moderation; otherwise it became a crime of peculation to lay hands on the spoilage, as regularly belonging only to the state. The confts Romulius and Veturius were convicted for having sold the booty taken from the Æquin. Liv. ib. iii.

Among the Jews, the booty was divided equally between the army and the people, though under the kings a different kind of distribution obtained. Num. xxi. 47.

Among the Mahometans, two thirds of the spoils are allowed to the army; the other third to God, to Mahomet, and his relations, and to the orphans, the poor, and the pilgrims. Calmet. Dict. Bib. tom. i. p. 321.

Among us, formerly, the booty was sometimes divided among the soldiers. If the general be in the field, every body takes what he can lay hold on; if the general be absent, the booty is distributed among the soldiers, two parts being allowed to the cavalry, and one to the infantry. A captain is allowed ten shires, a lieutenant fix, and a cornet four. See Prize.

BOUROU, in Geography, an island near the east coast of Orthee.

BOPAL, or BOPALTO, a town of Hindostan, in a district of the same name, in the country of Malwa; placed by Mr. Rennell in N. lat. 23° 14'. E. long. 75° 38'. The town is extensive, and surrounded with a stone wall; the streets are wide and straight. On a rising ground, to the south-west of the town, is a fort called "Futteh-gurh," newly erected, and not quite finished. It has a stone wall, with square towers, but no ditch. The spot on which it is erected is a solid rock. To the south-west, under the walls of this fort, is a very extensive tank or pond, formed by an embankment, at the confluence of five streams issuing from the neighbouring hills, which form a kind of amphitheatre round the lake. Its length is about six miles; and from it the town has the addition of "Tal" to its name. These hills, and others in the neighbourhood, contain a soft, free stone, and a reddish granite, the latter of which seems well fitted for buildings that will resist water, and the injuries of the weather; and it is accordingly used in the new embankment which is building at the east end of the lake. From this part rises the small river "Patare," and it is said that the "Betwah" takes its rise from another part of the same. The town and territory of Bopal are occupied by a colony of Patans, to whom they were assigned by the Mahrattas; but a handsome present is occasionally sent to conciliate their friendship. The people seem to be happy under their present government; and the Dewan, by his hospitality, and the protection afforded to strangers, has introduced the caravans, and travellers in general, to take this road between the Deccan and Hindostan. Asiafie Researches, vol. vi. p. 31.

BOPPART, or BOFARAD, an ancient town of Germany, in the circle of the Lower Rhine, and lower electorat, once imperial, seated on the banks of the Rhine, and formerly belonging to the archbishop of Trieres. Since the French revolution, it is the chief place of a canton, in the department of the Rhine and Meffic, and in the district of Coblenz, from which it is distant 8 miles south. The place contains 2220, and the canton 7232 inhabitants. At this town a toll used to be exacted of vessels which passed along the Rhine. Near the river the town is surrounded by high mountains, the summits of which are richly covered with woods; and when the foliage appears on the trees, the country about it forms a scene truly picturesque and extremely luxuriant. On a mountain behind the town was a Benedictine nunnery, called the Abbey of Marnenberg; and besides this, there were a convent of Carmelites, and another of Franciscans, in very romantic situations.

BOPPINGEN, an imperial town of Germany, in the circle of Swabia, and county of Oettingen, on the Egger; 5 miles west of Nordlingen, and 28 N.N.E. of Ulm.

BOPQUAM, or M'Quam bay, lies on the east side of lake Champain, in Swantown, Vermont, and has Hog island on the north at the mouth of Michicouci river.

BOQUET, a river of America, which passes through the town of Wallborough, in Clinton county, New York, and is navigable for boats about two miles, and there interrupted by falls on which are mills.

BOQUINEN, a township, in Spain, in Arragón; 18 miles N.W. of Saragossa.

BOQUINII, in Ecclesiastical History, a sort of Sacramentarians, who adhered to the body of Christ was present only in the eucharist to those for whom he died, that is, the elect. They took the denomination from one Boquinus, a Lutheran divine, who was one of the chief of the party.

BORA, in Ancient Geography, a mountain of Macedonia, mentioned by Livy, between Illivia and Epirus.

BORÉTA, a town of India, placed by Ptolemy on the other side of the Ganges.

BORBèASSOU, in Geography, a town of the island of Celebes, where are manufactures of cotton and silk stuffs.

BORACIC ACID. Acide Boracique, Boroxique. This substance was first discovered in 1752, by Hombreg; who, by mixing together in a subliming vessel a mixture of borax and fulplatin, obtained a white crystalline salt, which from its supposed medical properties he named volatile narcotic salt of vitreus, or delusive salt. The term boracic acid was appropriated to this salt by Lavosier and his associates, at the general reformation of the chemical nomenclature.

Boracic acid may be prepared in two ways: either by sublimation or precipitation. The best method of obtaining it, according to the former of these processes, is as follows:

Take two parts of purified borax reduced to a fine powder, and mix it with a glass alembic with one part of sulphuric acid previously diluted with an equal weight of water. On the application of a gentle heat, the borax will dissolve; and at a boiling temperature, there will first arise an acridulous water, and afterwards, when the mass in the alembic begins to grow thick, a light, white, glittering micaceous salt will collect in the capital, which is the boracic acid. As this salt sublimes only while the last portions of moisture are evaporating, it is necessary to return back the acidulous water repeatedly upon the mass in the alembic, in order to obtain the whole of the boracic acid; but this being a tedious operation, and generally terminating with the fracture of the
the alembic, is at present but little practised. The most expeditious and economical way of preparing the boracic acid, is by precipitation; for this purpose, take a boiling hot filtrated solution of purified borax in water, and add to it, by a little at a time, so much sulphuric acid as to make the solution slightly acidulous. The liquor, when cold, will be found to have deposited a considerable quantity of thin crystalline plates of boracic acid, and more may be obtained by successive evaporation and evaporation, till crystals of sulphate of soda begin to make their appearance. The sulphuric acid is on several accounts preferable to any other for the decomposition of the borax; yet the nitric, muriatic, or even the acetic acids may be made use of, and will effect a separation of the boracic acid from the soda with which it was united in the borax. The proportion of acid obtained by precipitation amounts, according to Beauné, to nearly one half of the borax made use of; and it is this kind of boracic acid that has been used by most chemists in their experiments on this substance. The precipitated acid is, however, by no means pure, as it retains, according to Cadet, a portion of the acid made use of in its precipitation, and confits, according to Beauné, of about

56 boracic acid
14 an impure unsublimable sal
30 water of crystallization
            100

Sublimed boracic acid is in the form of very minute thin plates, with a shining silver lustre, and remarkably voluminous in proportion to its weight. The crystallized acid has the same general appearance, only it is in larger plates, and of considerably greater specific gravity.

The taste of boracic acid is slightly subflaible; it reddens syrup of violets, but exhibits very feeble acid characters. It is very difficultly soluble in cold water, and requires a considerable proportion of hot water; as the hot solution cools, it deposits in crystalline plates nearly the whole of the acid which it had taken up. Alcohol takes up a larger quantity of this salt than water does, and burns in consequence with a green flame. On this account boracic acid has been supposed by some chemists to contain copper. But if a piece of paper is dipped in the alcoholic solution, and then dried, it will burn with a deep yellow flame; hence it is obvious, that the green tinge in question is only caused by a mixture of the yellow flame of the boracic acid with the blue one of the alcohol.

When boracic acid is heated to redness in a silver crucible, it becomes first of a pally consistence, and then melts into a tenacious glass perfectly colourless and transparent. By exposure to the air, this glass becomes opalescent, but does not undergo any other change; it is soluble in water, and may be obtained, by cooling and evaporation, in the late of crystalline plates as before. When fused in an earthen crucible, it dissolves some of the earth, and forms a semi-transparent glass considerably less fusible than the pure acid; and when dissolved in water, and evaporated, it becomes a gelatinous mass, superficially covered with a few crystals of boracic acid.

Neither the oxygenating nor deoxygenating processes appear to have the smallest effect on this acid; and all attempts to raise it to a higher degree of oxydation, or to decompose it, numerous as they have been, have not been attended with the smallest success. It unites in the moit way by single affinity with the caustie alkalies, and by compound affinity also with the earths and metallic oxides; its attraction, however, is so feeble, that it is incapable, when in solution, of dislodging even the carbonic acid from its basis. But weak as boracic acid is in the moit way, its fixity in the fire enables it to separate, in a high heat, the sulphuric, nitric, muriatic, and all the other volatile acids from their bases, forming with them a genus of salts called borates, none of which, except the sub-borate of soda, or common borax, has hitherto been made the object of chemical investigation.

Boracic acid, besides being obtained from the decomposition of borax, is also found native in certain hot springs and lakes in Tuquany. It is not applied to any medical, chemical, or economical use.

Boracite, Borax, Muriatia; Magnesia boracite.

Flavy. The colour of this mineral is yellowish, smoke or ash-grey, passing into greyish or greenish-white. It occurs in small cubic crystals truncated on the angles. The crystals are for the most part opaque, some are semi-transparent, and a few of the smallest are entirely transparent. Their lustre internally is considerate, and of the vitreous kind. The fracture is flat, thin conchoidal, passing into uneven and splintery. The crystals are often corroded more or less, and then are easily pulverizable; but when perfect, they are hard enough to give brilk and lively sparks when struck against the flint. Sp. gr. 2·56.

The borates, when exposed to a full red heat, becomes opaque, and loses about ½ per cent. of its weight, but undergoes no other change; when intensively heated in a clay crucible, it runs into a yellowish glass. It is entirely, though with difficulty, soluble in the muriatic acid by long digestion. According to the analysis of Weltrum, it consists of

| 68 boracic acid | 1·5 magnesia |
| 11 lime | 0·75 oxyd of iron |
| 2 filex | |
| | 96·85 |

Some later experiments, however, of Vaquelin make the proportion of lime to be much smaller; and it appears probable, that the only essential ingredients of this mineral are boracic acid and magnesia.

Boracite is found near Luxemburg, in the duchy of Bruns-wick, lying the sides of a vein in a hill of sulphat of lime. The crystals from their shape were known in the neighbourhood by the name of wurlfepth, or cubic spar, and were supposed by some mineralogists to be a variety of quartz. The presence of boracic acid in them was not suspected, till the analysis of Weltrum, published in 1788, in the Transactions of the Society Nat. Curios. Emmerling. Flavy. An. de Chim. v. 11.

BORAGE, in Bot. See Borago.

Boraginee, the ninth order of the eighth class of Jussieu, of which he gives the following natural character. Calix five-parten, permanent. Corolla ino communly regular. Stamens generally five. Germ simple, or four-lobed. Style one. Stigma either bifid, furrowed, or simple. Seeds four, or four-fined, either in a capsule or a berry; or else apparently naked, obliquely attached to the style, and for the most part enclosed in the permanent calyx. Corolla without a peripetal. Stem in most herbaceous; in a few, a shrub or a tree. Leaves alternate, often rough.

The genera are thrown into five divisions. 1. Fruit, a berry; stem, a shrub or a tree. Patagonia, cordia, cheritia, menas, varonm, tournerfortia. 2. Fruit, one or two-capsular, herbaceous. Hydrophylhum, phacelia, ellipta, dicchondra?
Fruit, the hemiflom foliages flowers consiiderable Nat. (harp small cool flowers and dried filaments foot calyx peduncles fallad. B. B. tolioles Schreb. 187. Alked to the boragine; herbaceous. Nolana, sponmomatus? folkia, the connecting link between the boragines and convolvuli.

La Marek (Encyc. Method.) gives the boragine a charac which belongs almost exclusively to the asperifolius of Linnzeus. He has only three divisions: 1. Four germs, or one, four-parted; the proper asperifolius. 2. Five germs, or one with five divisions; nolana, monieria, raputus. The natural situation of the last two was left undetermined by Julieu. 3. One undivided germ; comprehending the first and second division of Jullien. He has placed this division last, appreheing, and surely not without reason, that it ought to form a distinct order between the boragines and convolvuli.

The boragine compose the twelfth family of the eighth class of Venterat, in his "Tableau du regne vegetal." It contains only the asperifolies, with the Linnomar characte except that, in concurrence with Gartner, the fruit is consi dered as consisting of two or four nutts; in the former case each two-celled and two-feaded; in the latter, each one-celled and one-feaded; the seeds attached either to the inner edge or base of the nut by a filiform or capillary peduncle or placenta.

Gen. Char. Cal. perianth five-parted, permanent. Cor. monopetalous, wheel-shaped; border one-parted, flat; legmen acute; throat crowned with five emarginate, obtuse prominences. Stam. five, awl-shaped, converging; anthers oblong, fixed to the inside of the filaments in the middle, converging. Pk. germs four; style filiform, longer than the flamenta; stigma simple. Pericarp none; calyx larger, inflated, containing the seeds. Linn. Schreb. La Marek, Jull. Pericarp, nuts four, boney, ovate, a little compressed, slightly convex on one side, smooth, shining, light chesnut, obolutely angular, marked with a longitudinal furrow in the middle, and with parallel, transverse wrinkles, imperforate, one-celled, without valves. Sdtl solitary, ovate-acuminata, almck black. Gxrt.

Eff. Char. Cor. wheel-shaped; border spreading, acute; throat clofed with rays.

Species, 2. B. officinaris. Eng. Bot. 36. common borage. "All the leaves alternate; calyces spreading." Linn. Root long, fleshy, tender, white, fibrous; stem about a foot and a half long, branched, hollow, fusculent, cylindrie; leaves alternate, large, oval-lanceolate, obtuse, wrinkled, deep green, and, as well as the stem, rough, with sharp, rigid, white bristles, the lower one petiolar, the upper seflile; flowers terminating on branched peduncles, blue, flesh-coloured, or white; calyx and corolla divided to the base; tube short and white; filaments short, white, springing from the claws of the petal, with a sharp blue process, where the dark purple or blackish anthers are inserted. Said to have come originally from Aleppo, but now naturalized in many parts of Europe, and not uncommon in the neighbourhood of Lon-
don on dunghills and among rubbish, where it is scaredy more than baccal. It was formerly cultivated in gardens, on account of the foppied cordial virtues of its flowers, but they have long lost their reputation, having neither warmth, pungency, nor any other indication of active qualities. Its flowers, stem, and leaves contain an inruidious viscious juice, which, on being boiled a considerable time, forms crystals of nitr. A clarified syrum formed from it is prescribed by the French physicians in pleuritics, and other disorders which require a cool treatment. In Italy its young and tender leaves are in common use, both as a pot-herb and a spoilad. In France its flowers, with those of nallcrum (trquxulum), are put into salads as an ornament. In England the flowers and upper leaves are used as an ingredient in that summer beverage composed of wine, water, lemon-juice, and sugar, called a cool tankard, to which they seem to give an additional coolness. 2. B. indicus. "Leaves of the ramifications opposite, embracing the stem; foliolas of the calyx fipegittate." Linn. "Pedicules one-flowered." Miller. An annual plant, rarely rising a foot high. Stem branching, rough, with small, white, fibrous hairs; leaves lanceolate, rugged, only the lower ones opposite; flowers axillary, shorter than the leaves; foliolas of the calyx five-angled, hilpud, expand ing at the base into two remarkable sharp-pointed arocles; corolla white, pale-blue, or flesh-coloured, with five rufi coloured spots. A native of the Eaf Indies. 5. B. africana. "Leaves of the ramifications pediculate; foliolas of the calyx ovate, acute, erect." Linn. "Pedicules many-flowered." Mur. Whole plant hilpud, with ifff, fragil, brillles, seven or eight inches high, more branching than B. indicus. Leaves large, ovate, and opposite; floral leaves small and alternate; corolla small, blue, yellow within, with five purple spots; peduncules terminating, divided, and almost maced; foliolas of the calyx entire. Native of the cape of Good Hope, cultivated by Mr. Miller in 1759.

4. B. zeplanta. "Leaves of the ramifications fertile; peduncules one-flowered; calyx without ears." Linn. Mant. Stein hilpud, branching, about a foot high; leaves of the stem opposite, lanceolate, hilpud; of the branches alternate, more numerous, smaller, and more acute; peduncules axillary, filiform, solitary, longer than the leaves; calyx the length of the corolla, erect. A native of the Eaf Indies. 5. B. longifolia. Poiret. Barbary. "Leaves linear-lanceolate, filicile, alternate; calyx very hairy at the base." Wild. Alhed to the foregoing, but insufficiently distinct. Segments of the calyx entire, without ears. A native of Barbary. 6. B. orientalis. "Calyxes shorter than the tube of the corolla; leaves cordate." Linn. Petiolat; peduncules many-flowered; flamen longer than the corolla, hairy. La Marek. Root large, fleshy, black without, whitish within, full of an inruidious viscious juice; stem more than two feet high; root leaves large, on long peduncles, cordate; item leaves alternate, small, ovate, on membranous petioles, channelled at the base; flowers axillary, and terminating, panicked; tube of the corolla longer than the calyx, white, bordered white, reflexed. A native of the country about Constantiople. 7. B. ortica. "Calyxes the length of the tube of the corolla; leaves ovate." Willden. Taken up from Tunisia, cor. 6, and described from a dried specimen. Segments of the calyx ovate rhomboidal, very entire; flowers red.

Preparation and Culture. The first is a hardy annual, which will bow its own seeds, and come up without care. The seeds of the second, third, and fourth should be bow upon a hot-bed in March, and the plants should afterwards be separately planted in a small pot, with light earth, and plunged in a new hot-bed; in hot weather they should be allowa
allowed a good deal of air. The fifth is a perennial, easily propagated by the root, which may be parted in autumn, and planted in a dry and warm situation.

BORAGO (Morin). See Cynoglossum ovahalodes.

BORAH, Lat. Boraxna, in Geography, a town of Sweden, in the province of Upsala, situated in a mild and mountainous country, on the river Wilka. It was founded by Gustavus Adolphus, and in 1622 endowed with several privileges. Its inhabitants are a sort of itinerant pedlars, who deal in linen, and traverse the kingdom for this purpose. This town was destroyed by fire in 1723; but was afterwards rebuilt, and continues in a good condition. It has a spring of medicinal water; and has the forty-third vote in the diet.

BORAK, among Mahometans, a fabulous animal, supposed to be of a middle kind between an ass and a mule, wheron the prophet was carried in his nocturnal flight from Jerusalem into the Heavens.

This animal the Arabs called Al Borak, q. d. shining. The night when the journey was performed is called Lailat al Meera, i.e. the night of apparition; and the flight itself Al Mefra, concerning which there is a multitude of traditions.

BORANA, in Entomology, a species of Tortrix that inhabits Sweden. This is of a large size, with the head cinereous, and thorax fuscous. Fabricius, who describes it in his Mantissa, thus defines it specifically: wings varieed with cinereous and fuscous, with elevated scattered dots.

BORANI, in Ancient Geography, a people of Scythia, who, after having inhabited the borders of the Danube, passed the Cimmerian Bosphorus, under the emperor Julian, and established themselves in Asia.

BORANO, CAFE, in Geography, lies near the N.W. extremity of the large gulf of Venice, and forms the N.E. point to the cluster of islands that impede the entrance into that city. N. lat. about 45° 16'. E. long. 12° 30'. An island of the same name lies within the cape.

Female on a distinct plant, carippa, Rheede. Cal. spateus and spadix as in the male; perianth proper, three-leaved, permanent; leaves roundish, obtuse. Cor. petals three, roundish, permanent; in La Marec’s figure exactly similar in form and size to the leaves of the calyx. Pist. germ roundish; stamens three; small; stigmas filiform. Petals, drooping, roundish, obtuse, rigid, one-celled. Seeds three, sub-ovate, compressed, dithecate, filamintose.

Species, B. tubelliformes. La Marec Illust. Pl. 898. "Frons palmate, cowled; flutes farrata." Linn. A tree twenty five or thirty feet high; two feet thick at bottom, and one at top. Trunk, bark of a dark colour; wood dark rufous red, with a felt pith in the middle; fronds about eight, decussate (umbellate, La Marec), at the top of the trunk; little near fix feet long, round, and near a span in breadth below, flat, somewhat concave, and not more than a palm above, rough with spines along the edges. The leafy part large, widely expanded, folded like a fan, and used as such in its native countries; at the edges of the folds, furnished with prominent rough ribs; glistening at the extremity; of a dense and thick texture, frilidated lengthways with close veins; fruit size of a child’s head; extended rided or fluted, when ripe, blackish and fluting near the calyx, longitudinally frouted with furrows and yellow greenish yellow above, containing a dense pulp, at first soft and white, afterwards filamentous and succulent, of a sweetness not unpleasant to taste, and strong smell. In the pulp are separately embedded two or three oblong flat nats, with a thick woody shell, containing, when young, a blue, glabrous, excentric kernel, of a sweet, pleasant flavour, which finally becomes too hard to be eaten. Ray Hill. Plant. A wine and a tanger are made from the sap of the tree. Native of the East Indies.

BORAX, in Chemistry, sub-borat of soda.

Borax is a saline substance, which has hitherto been found only in Tibet, an extensive mountainous district to the north of Hindustan. According to the most authentic recent accounts, especially the report of Mr. Saunders, who visited Tibet, in company with Mr. Turner, in the year 1838, borax is procured from a mountain lake, fifteen days’ journey from the capital of Tibet. This lake is surrounded by rocky hills, and is entirely supplied by springs, no stream either falling into it or flowing from it. The water has a faint savour, and contains both borax and common salt; and, on account of its elevated situation, is frozen for a great part of the year. The edges and shallows of the lake are covered with a detritus of borax, which is dug up in considerable mlasses, and the holes thus made are gradually filled by a fresh deposition; from the deeper parts of the lake, rock salt is procured. The borax, in its rough flake, is called tetrac, and is brought to Europe in the form of a brownish grey impure amorphous salt, or in detached crystals, about an inch in length, of the form of compressed hexahedral prisms.

The purification of borax is an art which was first appropriated by the Venetians, afterwards passed to the Dutch, and is now practised in great perfection by some English chemists. The process is as yet kept a secret, but in all probability consists of calcination and fusion.

The crude borax is often covered with an oily or greasy matter, to prevent it from efflorescing, and, on this account, is not easily acted on by hot water. It appears, however, that by exposing the tetrac to a calcining heat, lower than its point of fusion, the greasy may be burned off, and other inflammable impurities may be got rid of; the residue being then reduced to a fine powder, and digested in boiling water, the saline parts will be dissolved, leaving most of the impurities behind. The further completion of the purification is probably effected by the common clarifying sublimes, and repeated fusion and crystallization.

Borax, when quite pure, is in colourless crystalline masses, very slightly efflorescent on exposure to the air. Its sp. gr. according to Kirwan, is 1.74. Its taste is somewhat sweeter, and more alkaline. It turns syrup of violets green; flowing, therefore, an excess of alkali in its composition. It contains, according to Kirwan,

- 34 boracic acid
- 17 soda
- 47 water of crystallization

98

Borax, when exposed to a dry heat, speedily dissolves in its water of crystallization; it then, as the moisture evaporates, becomes of an opaque white colour, and a voluminous fenny texture, like burnt alum. If the heat is increased to a moderate redness, it liquefies, and when cool, appears as a colourless transparent glass. If poured out of the crucible in order to cool, it should be transferred, as soon as it becomes solid, to a covered bottle, or other proper vessel, for it always cracks.
Biurax, the leaves of his Borax employed, retaining otherwise globlely, but life, Schreb. parts the Borax certainly point flowers the separate peduncles more Linumus their leaves anthers Borax, but it is termed Hems authors flowers Junct. tranparency, In their portion leaves lligma a lanceolata foliation, brightly the it by the crack it, ceufs evaporation weight it fo liorax of earths, soluble use accounts, so glasss same perfeftly charges different reasons, it acquires appearing of chaledony, on account of the partial effulgence that it undergoes. If made in a silver crucible, or if hastily melted in an earthen one, it is perfectly resoluable in water; but when kept fluid for a long time in a common crucible, it diffolves a portion of the earth of the vessel, and becomes little, if at all, soluble in water.

Crystallized borax requires twelve parts of water at the common temperature for its solution, but only six parts of boiling water; it therefore deposits crysftalls by mere cooling. Borax is decomposable by all the mineral and vegetable acids when added to excess, the boracic acid being separated, and the soda uniting with the other acid; but if only the excess of soda is combined with the other acid, the whole, by evaporation and cooling, forms a confusedly crystallized mass, consisting of the three ingredients in mutual combination. Borax will also diffolve and combine with nearly half its weight of boracic acid, forming borat of soda. In this salt the acid and alkaline parts completely saturate each other, so that it produces no change on fyrup of violets, neither does it possess any longer an alkaline taste; it does not effulference like common borax, nor are the forms of its crysftalls the fame. The affinity of soda for boracic acid is not so great as that of harytes, frontian, line, and magnetia. Thee alkaline earths, therefore, decompose borax; the pure alkali remaining in solution, and the earthy borats forming persistent insoluble salts. Potash is also capable of decomposing borax; but borat of potash being very soluble in soda, no precipitation takes place.

Silica and alumine combine in the dry way with borax, the former into a transparent, the latter into an opaque glass. If the ingredients are in nearly equal proportions, the glass is insoluble in the mineral acids; but if a considerable excess of borax is employed, the refult is a soluble glass. Of this circumstance Dr. Chevenix has ingeniously taken advantage by sublimating borax for caulsot potash in the analysis of the more refractory flowy compounds, the use of the former salt being more convenient, on many accounts, than of the latter. Borax will also diffolve most of the metallic oxides, receiving from each peculiar tinges of colour.

The uses of borax are considerable; it is employed in the laboratory as a very active flux, and as producing a more perfectly limpid fusion than any other substance. For the same reason it is an ingredient in some of the finer kinds of glases; though its dearness prevents its from being employed so often as it otherwise might be to great advantage. Borax is also highly useful to the jewellers and goldsmiths, as a flux for the solder, by which pieces of gold and silver are cemented together; and in the East Indies it is employed in the most way as a solvent for gum lace.

BORJEITONAGUS, in Ancient Geography, Worms, a town of Germany, according to Ptolomy, who says, it belonged to the Vangiones. It was their capital. See Worms.

BORBO, in Geography, a river of Piedmont, which discharges itself into the Tanaro at Atli.

BORJONIA, in Botany, (in honour of Galton Bourbon, duke of Orleans,) a name first given by Plumier to plants of different characters, afterwards transferred by Linnaeus to a genus in his class diaphylia decandria, which is obscurely defined, and concerning which there are in authors much confusion and inconsistence. La Mark says, that it differs from genista, only in having the segments of its calyx a little longer and sharper, which is falsely a flight and indeterminable circumstance; and from afpedathus, in not having its leaves fisculated, which is certainly no generic character at all. He follows Linnaeus, however, in keeping these three genera distinct, but unites it with liparia, from which he finds no reason to separate it. Linnaeus attributes to it only nine flumes, all united, and oblong; that liparia (a genus formed by him, late in life, from Thunberg's plants, collected at the cape of Good Hope) differs from it in having a tenth separate flumes. Boce says, that the borbonia has either nine or ten flumes, eight or nine of which are united at their base. La Mark, without noticing Linnaeus's distinction, ascribes to his united genera ten diadephous flumes; but it ought to be remarked, that all his descriptions are confusively made from dried specimens, and Boce informs us that none of the flowers are now cultivated in the Paris gardens. In this state of uncertainty we shall follow Willdenow in retaining the Linnaean distribution. Linn. 847. Schreb. 1165, Wilden. 1329. Jaff. 845. Nat. Ord. Papilionaceae-Leguminosea. Jaff.

Gen. Char. Cal. perianth one-keafed, semiisquinqued, turbinate, half the length of the corolla; segments lanceolate, acuminate, rigid, pungent, nearly equal, the lower one the longest. Cor. pentapetalons, papilionaceous, bifurc from the outside, banner reflexed, obtra, claw the length of the calyx; wings semicordate, a little shorter than the banner; keel two-petalled, lanulate, obtuse. Stam. filaments nine, united into a cylinder, defilute-linil longitudinally above, rising at the end; anthers small. Pift. germ subulate; style very short, ascendent; stigma obfine, emarginate. Pericarp. legume roundish, acuminate, one-celled, mucronate with fr. Sciol kidney-form.

Species, 1. B. ericifolia. Linn. "Leaves nearly linear, acute, villose beneath, heads terminal." A small, rather villose shrub; leaves alternate, pointed, nervebs and smooth above, villous and channelled beneath; flowers yellow, small; legumes very villos beneath. Its specific name is not a happy one. 2. B. trinervia. Linn. "Leaves lanceolate, three-nerved, very entire." Flowers yellow, terminating each on a separate peduncle. 3. B. angustifolia. La Mark, with a doubt whether it may not be trinervia of Linnaeus. "Leaves narrow-lanceolate, five-nerved, smooth; legumes oblong, pedunculate." A small shrub; leaves slender, interruptedly angular; peduncles two or three at the end of each branch. 4. B. barbata. La Mark (Illust. t. 619). "Leaves lanceolate, many-nerved, close-set, ciliate-bearded, very acute; flowers villous, subfalcate." Stem cylindric, with diverging branches; leaves imbricated, embracing the stem at their base. 5. B. ciliata. Willden. "Leaves cordate, embracing the stem, obtuse, many-nerved, very entire, ciliate." Stem cylindric-smooth; leaves an inch long, deeply cordate, ciliate at their margin, with long. flender hairs. Nearly allied to the foregoing, if it be more than a variety. 6. B. lanciata. Linn. "Leaves lanceolate, many-nerved, very entire." 7. B. cordifolia; La Mark, who affirms that Linnaeus's synonyme to lancifolia belong to this species. "Leaves cordate, many-nerved, very entire, smooth; flowers tomentose, sub-falcate." Branches villose; leaves terminated by a thorny point, crowded; segments of the calyx with thorny points; flowers covered externally with a white and silky down; banner brown within. S. B. crenata. Linn. "Leaves cordate, many-nerved, toothed." Stems with triangular, smooth branches; leaves falcate, or a little embracing the stem, rectilinearly veined, ending in a point; flowers smooth, pedunculate, three or four in a kind of raceme at the extremity of each branch; bracts cataceous. 9. B. puri/ orange. La Mark.
March. "Leaves cordate, many-nerved, smooth, a little toothed; flowers small, sessile, terminating." Branches smooth and angular; leaves sessile, acuminate; flowers two or three together; calyces smooth, with pointed, not spinous teeth; bracts lanceolate. 10. B. perfoliata. Willd. (La March Illust. pl. 679). "Leaves embracing the stem, very entire." Thun. Branches cylindric, angular towards the end, with scattered hairs; leaves alternate, nerved, veined, denticulate, smooth, terminated by a short point which bends outward, almost perfoliate, terminating; flowers four or five together in a kind of umbel, peduncled; segments of the calyces very sharp-pointed; bracts lanceolate. 11. B. nudata. Willd. "Leaves embracing the stem, waved with a reflexed point." All the species are natives of the cape of Good Hope.

Propagation and Culture. Mr. Miller succeeded only by laying down their young shoots, which are commonly two years before they are fit to be separated from the old plant. The best time for laying them down is the beginning of September. B. crenata was introduced into Kew garden from the Cape in 1774, by F. Masson.

BORBONIA, Levigata, and Tomentosa. See Liparia.

BORBONIA, (Plumier). See RHUS, Metopium, and Heisteria Coccinea.

BORBONICA, A. in Astronomy, a denomination formerly given by some writers to the solar faculae, on a supposition that they were satellites, or secondary planets. See Faculae.

Fromandus mentions a Frenchman, named Tarde, who had written a book express under the title "Altra Borbonia." Phil. Trans. No. 330, p. 287.

BORONICA, in Ornithology, a species of Motacilla, of a greyishfuscous colour, beneath a yellowish forbid grey; quill and tail-feathers brown, edged with grey. This is the fecunda borbonica of Brilhon. Buffon calls it petit sennons, and figurer de l'île de Bourbon. It is the Bourbon warbler of Latham. Inhabits the islands of Bourbon and Madagascar.

BORBONICUS, a species of Turdus, of a cinereous olive colour; crown black; abdomen and vent olivaceus yellow; tail fuscous, with two oblate bands near the tip. This inhabits the Isle of Bourbon. Its length is about eight inches; beak and legs yellowish; abdomen in the middle white; quill-feathers brown, edged with reddish. This is the Bourbon thrybus of Latham.

BORORITAE, or Bororiani, in Ecclesiastical History, a branch of the ancient Goths, in the 11th century, who, to the other errors of that sect, added this, of denying a future judgment. Their name is derived from geopones, filii, on account, as it is said, of a custom they had of be-mearng their faces and bodies with it. Epiphani. Hered. 25, an. 26. Auguf. de Hered. c. 5.

Some also have given this appellation, by way of reproach, to the Mennonites.

BORBORUS, in Ancient Geography, a river of Macedonia, which, according to Plutarch, encompanied the city of Pella.

BORBORYGMUS, in Medicine, a term employed to denote the rumbling noise produced by air pent up in the intestinal canal; from σφόγως, σφόγγος, σφόνγγος. It is a common symptom in cafes of disordered bowels.

BORBOTHA, in Ichthyology, a name given by some writers to the eel pout or burbot, gulas lutus, or, as Willughby names it, mullusca fluviatiles.

BORCANI, in Ancient Geography, a people of Apulia, according to Pliny.

BORCETTE, in Geography, the chief place of a canton, in the department of Roer, and district of Aix-la-Chapelle; Vol. V.

The place contains 3531, and the canton 17054 inhabitants; it has 30 communes.

BORCH, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg; 4 leagues from Magdeburg.

BORCHEI, or Borchen, a town of Germany, in the circle of Weffphalia, and bishopric of Minden. 3d on the As, having a manufactur of cloth; 50 miles W. of Minden.

BORCH, Henry Vander, in Biography, a painter and engraver, was born at Brussel in 1523, became a disciple of Giles Valkenburgh, and completed his studies in Italy. He was employed by the earl of Arundel in collecting antique curiosities for his lordship in Italy, and retained in his service as long as he lived. After the death of this noble patron, he was employed by the prince of Wales, afterwards Charles II., and continued for several years in England, where his paintings were well esteemed. But retiring to Antwerp, he died there in 1662. His chief excellence consisted in painting fruit and flowers. Among the few etchings which he executed are the "Virgin and Child," from Parmagino, engraved at London and dated 1627; a "Dead Christ, supported by Joseph of Arimathea," from the same master; and "Apollo and Cupid," from Perin del Vago. Pickenston and Strutt.

BORCHWORM, or Borcworm, or Waren, in Geography, a town of Germany, in the circle of Weffphalia, and bishopric of Liefge; 10 miles W. of Liefge.

BORCKELOE, or Borckelo, a town of the united states of Holland, in the county of Zutphen, on the confines of the bishopric of Munffer, situated on the river Berkel; 15 miles E. N. E. of Zutphen, and 42 W. N. W. of Munffer.

BORCUM, a small island in the German ocean, near the coast of East Friesland; about N. N. W. from the point of Embden, at its S.W. entrance into the port and river, and about 2 leagues N. E. by E. from the island Riétum. Between them is a channel called the West Channel of the Emb. N. lat. 53° 36'. E. long. 6° 18'.

BORDA, Charles, in Biography, formerly Chronicier de Borda, and a chef d'Escadre, in the royal navy under the old French government, was born at Dax, May 4, 1733, and distinguished himself in early life as an able mathematician. Of his knowledge in this department of science ample evidence may be found in the Memoirs of the Academy of Sciences, for 1765 and 1767, of which he was admitted a member in 1754. These memoirs contain many excellent papers, communicated by Borda, on different objects of hydraulics; on the resistance of fluids; on water-wheels and pumps; on the projections of bombs; on the method of determining curve lines; on the properties of maxima and minima; and on the best method of choosing by lot. In the years 1771 and 1772, he performed a voyage, by command of the king, with Verdun de la Crane and Pingré, in the Flora frigate, in which he had the rank of "lieutenant de Vailieu," to various parts of Europe, Africa, and America, for the purpose of improving the sciences of geography and navigation, and of making experiments with various nautical instruments and time-pieces, with a view of ascertaining accurate methods for determining the longitude. The result of the observations of these three
navigators was afterwards published at Paris in 1778, in 2 vol. 4to., under the title of “Voyage fait par ordre du Roi, in 1771 and 1772, &c,” in which Bord's fame was not the least considerable. An account of the result of this excursion may be also found in the Memoirs of the Paris Academy for 1773. To Bord the public are likewise indebted for the best chart of the Canary islands, which served as a model for the valuable map of those islands, published in Spain in 1788. In 1774, he undertook a voyage to the Azores, the Cape Verde islands, and the coast of Africa. In the year 1785, he published a valuable work, entitled “Description et usages du cercle de Réflexion,” in which he revived the use of the reflecting circle proposed by Tobias Mayer in 1756. He was the first founder of the schools of naval architecture in France, and formed the plan of education, and the regulations to be adopted in these seminaries. He also applied the principles of Euler to the uniform construction of ships, so that all those of the French navy might be equal with respect to sailing. And the advantages, in point of form, with regard to quick sailing and manoeuvring, possessed by French ships which are constructed on true mathematical principles, and actually acknowledged by experienced British officers, have been principally owing to the genius, knowledge, and exertions of Bord. He likewise brought into use Mayer's old method of measuring terrestrial angles, after it had been long neglected; applied it to astronomic observations; and invented a circle on a new construction, with moveable telescopes, together with other instruments; such as metallic rules for measuring bales, which were used in the new measurement of an arc of the meridian in France; and to the labours of Bord the accuracy of this measurement has been justly ascribed. He took the most active part in the late reform of weights and measures introduced in France; and he caused to be calculated and printed, at his own expense, the logarithms of the decimal parts of the circle, according to the new division into 400 parts. In 1792, he invented instruments and methods for determining, with a precision before unknown, the length of a pendulum, swinging seconds at Paris. M. Lalande has published, in his Abrégé de Navigation, Bord's new method for gauging vessels, together with the tables. Bord was inspector of the dock-yards, in which situation government put great confidence in his talents; and, in 1779, he was one of the candidates for the office of director of the French republic. Although his health had been much impaired, in consequence of serving in the American war with d'Eftaing in 1777 and 1778, he continued to employ himself in a variety of useful labours. At length, however, a drop of the breath proved fatal to him, on the 26th of February, 1799, in the 64th year of his age. Lalande's Hist. Astron. for 1799.

BORDAGE, the condition of service of the bordarii. Du-Canon. Gloss. Lat.

BORDARII, often mentioned in the Domeday inquisition, were distinct from the servi and villani, and seem to be those of a less servile condition, who had a bord, or cottage, with a small parcel of land allowed to them, on condition they should supply the lord with poultry and eggs, and other small provisions for his board and entertainment. Though, according to Spelman, the bordarii were inferior to villani, as being limited to a small number of acres.

Bordarii also denote servants, or workmen, employed about the house in the necessary offices of fetching wood, drawing water, grinding corn, cleaning yards, and the like: by which they stand distinguished from villani, employed in the tillage of lands. See Villain.

BORDAT, in Commerce, a small narrow stuff which is manufactured in some parts of Egypt, particularly at Cairo, Alexandria, and Damietta.

BORD-BrIGCH, Borg-bryce, or Burgh-bryce, Sax. in English Antiquity, a breach, or violation of fortification, pledgebreach, or breach of mutual fidelity.

Borde, Andrew, or, as he calls himself, Andrew Epitaurus, in Biography, was born at Beverley in Suffolk, in the early part of the 16th century, and entered early among the Carthusians. Quitting his monastery, he went to Montpellier, and applied himself to the study of medicine, and in 1542, was made a doctor in that faculty. He now returned to England, and having been admitted of the university of Oxford, he came to London, and was made fellow of the Royal College of Physicians, which had been lately established here, and one of the physicians to king Henry VIII. at Winchester, where he principally resided and practiced. Though advanced to these honours, his works, full of gross and barbarous errors, shew he was but moderately skilled in languages. He, however, affected to be learned, generally beginning his accounts of diseases, with giving the Greek, Latin, and Arabic names by which they were known. His "Breviarv of Health," containing a short account of all diseases, and their remedies, was published in 1547. This was republished in London in 4to. in 1575, with some additions which the author had called the extravagants. He was also author of a compendious regimen, or dietary of health. made in mount Pyllor, which was published in 1562, and of a book on prognostics, and on urines. Bord was also a wit and a poet. He published "Tales of the mad men of Gotham," a book full remembered: and a very singular work, partly profe, partly in verse, which he called "The Introduction of Knowledge, &c." dedicated to the princess, afterwards queen Mary. Before the first chapter is a wooden print of a naked man, with a piece of cloth and a pair of shears, with this inscription:

"I am an Englishman, and naked I stand here,
Musing in my mind what reign I shall wear:
For now I will wear this, and now I will wear that,
And now I will wear I cannot tell what, &c."

The thought, Dr. Aikin says, is taken from the Venetians' description of a Frenchman. It was probably in consequence of his having taken more liberty than was allowed at that time with some person in power, that he was thrown into the Fleet prison, where he died in 1549. Haller Bib. Med. Aikin's Bib. Mem.

Bordeaux, in Geography, a town of France, in the department of the Drome, and chief place of a canton, in the district of Die, 10 miles S. W. of Die; the place contains 11,81, and the canton 3885 inhabitants: the territory comprehends 1724 kilometres and 9 communes.

Bordekow, a town of Poland, in the palatinate of Lemberg: 36 miles S. of Lemberg.

Bordelieire, in Ichthyology, the common French name of a fish included in the Cyprinus genus, that is found in the lakes of cold mountainous countries. This appellation appears to be indiscriminately applied to the Cyprinus bairner, and Cyprinus lutca of Bloch.

BorEDIUM, Toussaint, in Biography, was born at Paris in 1728. Having distinguished himself for his industry and skill in his profession, he was admitted member of the college of surgeons there in 1750, and professor of physiology in the school of St. Come. He was also, in succession, made honorary member of several foreign academies, to whose transafions or memoirs he was a frequent and liberal contributor. His works are "Essai sur la physiologie," 12mo. published in 1756, and again in 1784. An elementary work,
work, composed for the benefit of his pupils: "Remarques sur l'infériorité de quelque parties," 12mo. 1757. He reckons the tendons and aponeuroses of the muscles among the inextensible parts. In 1768, he published a translation of Haller's Elements of Phystiology into French; in 1769, "Dissertation sur les antécipées," Sv. & c., and in 1774, "Mémoires sur le danger des enfilailles pour la cure radicale des hernies," 12mo. For the titles and account of his dissertations, published by the academies with which he corresponded, see Haller Bib. Chirurg. Elov. Dift. Hist.

BORDENTOWN, in Geography, a pleasant town of America, in Burlington county, New Jersey, situated at the mouth of Crofwick's creek, on the eall bank of a great bend of Delaware river; 6 miles below Trenton, 9 N. E. from Burlington by water, and 15 by land, and 24 miles N.E. from Philadelphia. This town contains about 100 houses, and is a thoroughfare from New York to Philadelphia.

BORDER, in Gardening, a narrow stripe or portion of ground running along the sides of the walls, or other fences that inclose gardens, and ornamented lands, and which bound the walks, or serve to separate the different principal divisions of the former, the earth being generally laid out in a gently sloping manner from the front to the back parts. These compartments are either of the useful or ornamental description.

Tofe of the first kind, are such as are carried round the walls of garden-grounds, and which are mostly employed, especially where the aspect is to the south, in planting out various sorts of fruit-trees upon, such as cherries, figs, plums, apples, pears, peaches, nectarines, apricots, &c. in order to their being trained to the walls or fences, so as to form wall-trees, as well as extremely useful in raising different early esculent herbs, roots, and leguminous crops; and on the other aspects, for the fowing, reaping, and pickling out of many sorts of fruits and plants upon, in the summer season, that require a cool situation, or a degree of shade at particular periods of their growth. The general rule in laying out these borders is, that of making them with a breadth in proportion to the height of the walls, or palings towards which they are formed, which should never be less than eight or twelve feet. They were formerly made not more than five or six feet in breadth, which is much too narrow for convenience in the culture of the plants, or the management of the trees that may be planted on them. Where trees are to be planted as espaliers, ten or twelve feet are the breadths that should, in most cases, be allowed.

As to borders intended for the raising and growth of different sorts of flowers, or for small shrubs and herbaceous plants; or flowers being planted out in assemblage or mixture with each other, five or six feet in the former, and eight in the latter, may be proper breadths for the purpose.

Their depths, where trees are to be planted, should never be less than two feet at the walk, gradually increasing to three at the backs or fences. Some fruit-trees, however, require much more, as pears and apples. In other cases, one foot at the walks, and two at the backs, may form a sufficient depth and slope for the perfect culture of the crops that may be grown upon them. For flowers, and the smaller sorts of shrubs, it is often convenient to have them a little rounded on the surface. Where the situations in which the borders are made are of the more moist and retentive kinds, having clayey, or gravelly and cakyey bottoms, proper drains should be formed, and conducted along the fronts of borders to the full depth of the furrows, in order, effectually, to convey off the injurious wetness that may take place, and allow of a suitable bed being formed for the upper foil. This is often effected by paving the bottoms of the beds with tiles or bricks. But a much less expensive, and at the same time, equally effectual method is advised by the author of the "Scotch Forcing Gardener," which is, that of letting the bottoms be laid in a sloping direction from the walls to the drains, a fall of six inches being given, first with a layer of good loam, two inches in thickness, being spread evenly, and well rolled down; then a similar stratum of clear pit or river gravel applied over it, and forced down in the same manner; upon this, another coat of loamy earth is to be deposited to the thickness of an inch or more, and well pressed down; the whole being executed while the materials are in rather dry condition. These should be afterwards a little moistened, and well rolled down till the surface becomes glazed, the waterings and rollings being continued alternately, till the whole acquires a firming hardnese, and the gravel begins to show itself clearly through the loamy coat. In this way, it is asserted, bottoms may be formed, through which the roots of no trees can penetrate, and which are at the same time perfectly favourable to the growth of trees and plants.

In constituting the borders, those fulslances and mixtures of different materials, which are most adapted to the growth and success of particular sorts of trees or plants, will be explained in describing the culture which they require. Where the raising and growth of most sorts of culinary vegetables are the principal object of borders, there should be conisidered a due proportion of good vegetable mould, in combination with a proper quantity of rich, mellow, loamy earth, a suitable portion of well-rotted flable dung, according to circumstances, being incorporated with them, which produce them in the greatest perfection.

There is another sort of useful border, which is that which divides or surrounds the principal compartments or divisions of kitchen-garden grounds, and which immediately bounds or verges the main walks, as being convenient for planting ranges of dwarf-apple, pear, plum, cherry, medlar, and other trees upon, as espaliers, as well as for the culture of many herbaceous, esculent plants. The line of espalier trees, in these cases, should be planted at least three or four feet from the outer edges, so that there may be three or four feet borders on the outside next the walks, and a smaller one on the inside of the espaliers, the broader outside borders serving for the rearing and culture of many low-growing, esculent plants; and sometimes, where the kitchen and flower-garden are united, as flower-borders. The smaller inward borders may be found useful in raising many sorts of small plants and herbs, as lettuces, &c.

Borders of the latter, or ornamental sort, as those of pleasure or other grounds, must be formed according to circumstances. It was formerly the taste, in many places, to have almost every walk bounded on each side by a border embellished with various ornamental plants; this taste has now, however, in a great measure, given way to that of planting only on one side. A fine walk, ornamented on each side by spacious borders, fully planted out with curious flowering shrubs, and other plants, have, notwithstanding, a fine appearance and good effect in many situations.

Borders of curious flowers, carried along the boundaries of grass plots, or lawns contiguous to the house, whether formed in a straight or serpentine manner, produce an agreeable effect, and much variety. The borders for particular kinds of flowers, such as the curious sorts of hyacinths, tulips, ranunculuses, anemones, caramans, and various others, may be made either along the sides of walks, or detached in other parts of gardens, or ornamented grounds. Such borders as immediately bound or verge gravel, or sandy walks, should be planted on the sides, with edgings of
fome dwarf-evergreen sort of plants, such as those of box, thift, diaies, pinks, &c.; but the fift is the neatift and most durable plant for the purpofe. See Bulus, and Edging.

These forts of borders fhould always be rafed two or three inches or more above the common furface level; fhuch as are detached being generally finished off in a gently swelling or rounding form, in order that they may afford the full effect.

Border, in Heraldry. See Bordure.

BORDERIES, in Geography, a town of France, in the department of the higher Pyrenees, and chief place of a canton, in the district of Bagneres, four leagues S. of La Barthe; the place contains 368, and the canton 2822 inhabitants; the territory comprehends 2741 kilometres, and 11 communes.

BORDERES, among Florals, are fuch leaves as fland about the middle thrum of a flower.

BORDES, in Geography, a town of France, in the department of the Ariège; 15 leagues W. of Mirepoix.

BORDEU, Anthony, in Biography, a physician of considerable eminence, was born at Helfe, in Paris, in 1693. After being initiated in the study of medicine by his father, he went to Montpellier, where he was admitted doctor in that faculty in 1719. Invited, in 1723, to Toul, the capital of the province, he acquired such reputation, as to procure him the offices of physician to the military hospital at Bagneres, and of inspector of the mineral waters there. To the waters he paid great attention, and in 1750, he published a small treatise, shewing the effects he had experienced from them in a variety of diseases. He lived to an advanced age, but the precise time of his death has not been noted.

Bordu, Theophilus de, following the steps of his father, attained to a still higher degree of professional eminence. He was born in 1722; and having passed through his studies with singular credit, was created doctor in medicine at Montpellier, in 1743. In 1745, he was appointed to succeed his father, as inspector of the mineral waters, and professor in anatomy, which was his favourite study. In 1747, he was made corresponding member of the Royal Academy of Sciences at Paris, whither he soon after went; and after passing through the usual course of studies, he was admitted doctor in medicine there, in 1754. He was taken off suddenly by a stroke of apoplexy in 1756, being in the 53rd year of his age. He was through life diligent and attentive to his professional duties, and seems to have been actuated by a desire of improving his art, and of leaving memorials of his industry and ingenuity. The principal of his works are, "Chylyficationes historia," his inaugural thesis, 1742, re-printed at Paris, 1752, 12mo, with his "Recherches fur les glandes." He thought he observed a duct passing from the thyroid gland to the trachea; an opinion, which he repeats in another of his works, but without sufficient ground. "Difertation physiological de fensu generis confederato," Montpellier, 1743, 8vo; 1751, Paris, with his "Chylyficationes historia." Letters contenant des effails fur Philofoie des eaux minerales du Darn, Sc. 12mo. 1746. In thefe he treats of the properties of the waters, and of the geography of the Bearns. "Recherches anatomi-ques fur la position des glandes et fur leur action, Paris, 1751, 8vo. "Recherches fur le pouls par rapport aux criftes," Paris, 1756, 12mo., in which he has gone much beyond Solano in his differentiation of pulses, and beyond what can be followed in practice. "Recherches fur le tifflu muqueux, et l'organe cellulaire," Paris, 1766, 12mo. Haller accuses him of difingenuity in attributing to himself the discovery of some properties of the cellular membrane, which had been before defcribed by him and others, but does not deny the work to have on the whole considerable merit. Hall. Bib. Abat. Ely. Dift. Hist. Aikin's Gen. Biog.

Bordue, Francis, brother to Theophilus, and educated under his father, was born at Pau, in 1737. Having taken his degree of doctor in medicine at Montpellier, in 1755, he returned to Pau, and was appointed to supply the place of his brother, as inspector of the waters there. In 1757, he published "De feconditut & contrac- tibilitate partium in corpore humane fanco," Montpel.; and in 1765, "Precis d'observations fur les eaux de Bagneres," &c. 12mo. collected principally from the works of his father, brother, and other writers on the subject. "Recherches fur les maladies chroniques, leur rapports avec les maladies sigues," &c. 1775, 8vo; principally with the view of shewing the utility and the manner of administering mineral waters in the cure of chronic complaints. Haller. Bib. Cimburg. Ely. Dift. Hist.

BORD-FREE. See Free.

Bord-Halfpenny, or Bord-Halpenny, money paid in markets and fairs, for setting up boards, tables, and stalls, for the sale of wares.

BORDIGHERA, in Geography, a town of Italy, in the state of Genoa, 5 miles E.N.E. of Ventimiglia.

BORD-LANDS, the provinces anciently kept by the lords in their hands for the maintenance of their table or board. This was anciently called bordage.

BORDO NUOVA, in Geography, a town of Servia, 18 miles E.S.E. of Piltina.

BORDOE, one of the Faroe islands, having a harbour on the N.W. coast.

BORDONE, Paris, in Biography, a painter of history, portrait, and architecture, was born at Trevigi, in 1513, and at a proper age became a disciple of Titian, whose uncommunicative disposition he had occasion to regret. He studied and imitated the style of Giorgione, and acquired such reputation, that at the age of 18 years he was employed in painting a picture in the church of St. Nicholas. From Venice he removed to Vincenza, in consequence of an invitation to adorn a gallery with paintings in fresco, in which Titian had exhibited a design representing the judgment of Solomon. Bordone composed the history of Noah and his sons, which he finished with such care, that it was not esteemed inferior to the work of Titian. Having finished several considerable works at Venice and Trevigi, he entered, in 1538, into the service of Francis I. of France; and gained additional reputation by various historical subjects and portraits, which were excellently designed, and recommended by a charming tone of colour. On quitting France he visited several cities of Italy, in which he left a number of memorable works, as monuments of his extraordinary abilities. His colouring resembles nature, and his portraits have been very much admired; several of them are still preferred in the Palazzo Pitti at Florence, the colouring of which is clear, fresh, and beautiful. This artist died in 1588, at the age of 75, according to Vafari; but according to Fulbin, at the age of 65 years. Pilkington.

BORD-SERVICE, called also Bordage, the tenure of lands on condition of furnishing provision for the lord's board or table.

Some lands in the manor of Fulham, and elsewhere, are still held of the bishop of London, by the service, that the tenants pay fixpence per acre in lieu of finding provision for their lord's table.

BORDURE, or Border, in Heraldry, is a partition line running all round the inside of the field, of an equal width, taking up one-fifth from the outer edge of the field, and without any shadow. Arms having a plain bordure, are emblazoned.
blazoned argent, a bordure gules; but if indented, engrailed, embattled, &c. argent, a bordure indented, gules. The bordure always gives place to the chief, the quarter, and the canton; for example, or, a bordure, azure, and a chief, gules. The chief, therefore, is always placed over the bordure, as are also the quarter and canton. The bordure is continued under the chief, but with the quarter and canton it continues round, until it touches them, and there finishes; but with other ordinaries, as the chevron, fess, bend, &c. the bordure always passes over. In arms empaillée with another having a bordure, the bordure must finish at the empaillé line, and not proceed round the cost, as is too often practised. When the bordure is charged with bezants, plates, billets, or pellets, it is termed a bordure, gules, bezantée, plate, billetée, or pelletée; all other charges are expressly mentioned as to number and colour. The bordure is borne different ways, as gobone, cheque, vair, bend, &c. which are explained under the different terms. See GOSONE, &c.

The bordure is not considered as one of the honourable ordinaries, but as a mark of difference, to distinguish one family from another.

BORDURE, Per, an inner bordure, appearing as two bordures: bordure indented, with the middle line indented.

BORDURE, point in point indented, differs from the bordure per bordure indented, as the indents must be from line to line, that is, mult touch both sides of the bordure.

BORDURE of the field, is merely a partition line, of the colour of the field, running round the arms. This bearing is never used in English armory, but is often borne both in France and Germany.

BORDURE Enter, commonly called enteron, or entoire, a term when charged with inanimate things, as celestial shells, &c.

BORDURE Encore, as called when charged with birds.

BORDURE Enmy, when charged with lions.

BORDURE Verkey, when charged with vegetables.

BORDURE Purplicawed, when it is shaped like vair.

BORDUUN, German, probably from Bourdon, Fr. a flot in an organ so called, of which the sounds are an octave lower than the diapason, to which this flot is in the same proportion as the double-bass to the violoncello. In an organ, of which the longest pipe in the diapason is sixteen feet, that of the borduun would require thirty-two feet. See ORGAN and DIAPASON.

BORE, in Geography, a town of Asiatic Turkey, in the province of Caramania, 70 miles E. N. E. of Cogni.

Bore, a term used to denote a sudden and abrupt influx of the tide into a river or narrow strait. This prevails to a considerable degree in the principal branches of the Ganges, and in the Megna; but the Hooghly river, and the passageways between the islands and fands situated in the gulf, formed by the confluence of the Ganges and Megna, are more subject to it than the other rivers. This may be owing partly to their having greater "embochures," in proportion to their channels, than the others have; by which means a larger proportion of tide is forced through a passageway comparatively smaller; and partly to the want of capital openings near them, by which any considerable portion of the accumulating tide might be drawn off. In the Hooghly or Calcutta river, the bore commences at Hoogly point, where the river first contracts itself, and is perceptible above Hoogly town; and its motion is so quick, that it hardly takes up four hours in passing from one to the other, although the distance is near 790 miles. At Calcutta it sometimes occasions an instantaneous rise of five feet: and both here, and in every other part of its track, the boats, on its approach, immediately quit the shore, and seek safety in the middle of the river. In the channels, between the islands, in the mouth of the Megna, &c., the height of the bore is said to exceed twelve feet; and it is so terrific in its appearance, and dangerous in its consequences, that, on the whole, will venture to pass at spring-tide. After the tide has passed the islands, no vehicle of a bore is seen, which may be owing to the great width of the Megna, in comparison with the passageways between the islands; but the effects of it are visible enough, by the sudden rising of the tides.

The bores are also high and dangerous in the mouths of the river Indus. To this sudden influx of the tide, in a body of water elevated above the common surface of the sea, may be ascribed the injury suffered by Alexander's fleet, and described by Ariean. He says, those ships that lay upon the land were swept away by the fury of the tide, while those that stuck in the mud were not swept away without damage. In order to account for this fact it should be considered, that the bottoms of channels, in great rivers, are muddy, while the shallows are formed of sand; and it is the property of the bore to take the shorter cut up a river, instead of following the windings of the channel; consequently it must cross the sand-banks it meets in its way; and it will also prove more destructive to whatever it meets with aground than what is afloat. Kennell's Memoir.

BORE, in Gunnery, the bore of a gun, or piece of ordnance, is used for the chaise or barrel; though it seems rather to denote the diameter of the chaise. See CALIBER, and CANNON.

BORE, figure, in Smithery, denotes a square heel point, or Shank, well tempered, fitted in a square socket in an iron wingle, serving to wind holes, and make them truly round and smooth within.

BOREA, an ancient name for a species of JASPER, of a bluish green colour.

BOREADES, in Mythology, the patronymic names of Zethes and Calais, the sons of Boreas. Hyginus (feb. xlv.) says, that they had wings to their head and feet.

BOREAL SIGNS, in Astronomy, the first six signs of the zodiac, or those on the northern side of the equinoctial.

BOREALIS, AURORA. See AURORA BOREAIS.

BOREALIS, in Comology, a species of Venus. This shell is lenticular, with very remote, erect, membraneous transverse striae. Gmel. This is a small shell, measuring about an inch and a half in length; colour, dirty white. Inhabits the north of Europe. Donov. Brit. Shells, &c.

BOREALIS, in Entomology, a species of Tabanus, distinguished by having the eyes with three purplish bands; abdomen black, the segments whitish at the edges. Size of T. plurialis. Inhabits Norway. Gmel. Fabr. The thorax of this insect is brown; abdomen black with a pale glaucous spot on each side of every segment; legs black. This is a rare species.

BOREALIS, a species of Coccinella, of a reddish, or yellowish colour, with twelve black dots on the wing-cases, and four on the thorax. Thunberg, Fabr. &c. This is a native of the Cape of Good Hope. Shape gibbous, beneath of a yellow colour.

BOREALIS, in Natural History, a species of Clio, of a whitish colour, having the lobes of the head terminated in a flesh coloured point papilla; tentacula three, fleshly, and thick at the mouth. Inhabits the north seas. Tallas, &c. This is nearly allied to Clio reitii. Gmelin supposes that it may be the same.

BOREALIS, a species of Echinorhynchus, found in the intellines of the Eider duck. Gmel. This is called Sipunculus lenticis, by Phips. it.

BOREALIS, in Ornithology, a species of Anas, with a narrow bill, the head green, throat and abdomen white. Gmel. This
This is the Greenland duck of Latham, who informs us it is a native of Iceland, where it inhabits fens, and is very scarce.

*Borealis*, a species of *Tringa*, the belly and legs of which are purplish; body above emerald, beneath white; tail and wings dull. Found in King George's bay. This is the *Boreal sandpiper* of Latham. The bill is short, black, and somewhat gibbous at the tip; eye-brows white.

*Borealis*, a species of *Motacilla*, of a green colour; beneath yellow; front, throat, and temples ferruginous; tail rotund, feathers on the sides and at the tips white. A native of Kamtchata, called by Latham the *Ruffish headed warbler*.

Obf. The bill is pale; legs black; and the whole body tinged with olivaceous colour.

*Boreas*, a Greek name now in popular use, for the north wind. Etymologists usually derive the word from *bura*, clamor; or from *beps*, food, because it creates an appetite.

Pezron observes, that anciently, and with much greater propriety, *Boreas* signified the north-east wind blowing at the time of the summer solstice; he adds, that the word comes from the Celtic *bore*, morning; because their principal light, in that season, came from that quarter, whence also the winds then usually blew.

The Greeks erected an altar to Boreas, whom they considered as a deity, the son of Aegeus and Aurora, whose feet was in Thrace. He is represented on the temple of the eight winds at Athens with his robe before his mouth, as if he felt the cold of the climate over which he presides, agreeably to the description of Ovid, who calls him *gêthos tyran-ness*, the shivering tyrant. Met. vi. ver. 711. But he is usually described by the Roman poets as violent and impetuous. Ibid. ver. 686—ver. 707.

The qualities allowed by naturalists to this wind are coldness and dreyness.

*Boreas*, in *Entomology*, a species of *Bombyx*. (Phal. Linn.) the wings of which are tailed, and varied with emerald and fulvous; on the fin, or anterior pair two dots, on the posterior wings a single transparent one. Fabricius, &c. This is a native of America, and has the anterior wings falcatated.

*Boreas*, a species of *Cancer*, in the family *Aeateus*, that inhabits the north seas; it is distinguished by having the thorax acutated, and the second and third pair of legs filiform. Fabr.

Obf. The beak of this kind is short, depressed, acute, grooved on each side with a strong tooth beneath.

*Boreas*, in *Ancient Geography*, a mountain of Arcadia, on which are the remains of an old temple, which, it is pretended, was built by Ulysses after his return from Troy.

*Borea*smi, were feasts instituted at Athens in honour of Boreas, who was thought to bear some relation to the Athenians, as he had married Orityla, the daughter of Erec- theus; for which reason, when, in a sea-fight, many of the ships of their enemies were destroyed by a north wind, the Athenians imputed it to the kindliness manifested by Boreas to the native country of his wife. Paunians Attic. We are informed by the fame author (Arcad.) that solemn sacrifices were offered to Boreas at Megalopolis in Arcadia, where he had a temple, and divine honours.

*Borech*, in *Natural History*, a kind of salt brought from Feria.

*Borecole*, or *Borcole*, in *Agriculture*, a plant of the cabbage kind, sometimes cultivated in the field for the purpose of a green winter food for cattle flock. There are three sorts of it, the common borecole, the green borecole, and the Siberian borecole, or curled cole, or kale. The last sort is the most hardy.

These plants are grown to most advantage in the field, where the loils are rather strong, fresh, rich, and deep, whether of the clayey or loamy kind; and where they have been deeply flurred by the plough, and had a good proportion of manure turned in. See *Brassica*.

In Mr. Baker's experiments in planting them in rows at the distance of two feet each way, for the use of the horse hoe; the produce was very considerable. And he supposes that it would be still greater, if they were cultivated at the distance of eighteen inches. If the crops were equally good, there would be, he affirms, from the produce here already obtained, in the first method, seventeen tons fifteen hundred weight on the acre; and in the latter, more than twenty-three tons twelve hundred. On this account, as well as that of their being capable of being cut over two or three times, and their standing the severest frost, it is concluded that they are highly deserving of the farmer's attention as a winter food for cattle and sheep, though it is confided that the first produce may not be so great as in the common cabbage, but that deficiency is made up by the succeeding ones. There is likewise rather more trouble in collecting the food and conveying it to the animals.

It is fuggelled, without having been subjected to the test of actual experiment, that the best mode of consuming this sort of food by sheep flock, would be to have two small fields under this kind of crop, proportionate to the number of animals; and to turn the ewes or other flock into one of them about the beginning of September, or the following month, for a few hours in the mornings and evenings for five or six weeks; lodging them on a portion of grass or fellow ground near it for the rest of the time; in order that they may evacuate themselves by which much improvement may be produced in such lands; and when all the more luxuriant leaves of this piece have been cropped and consumed, the other field should be managed in the same way.

In this method it is fuggelled that a flock of store sheep might be kept a whole winter at a very moderate expense; and while the produce of one piece was consuming, the other would be coming forward. It is remarked, that the flock should not be kept so long upon the crops as to injure the stems of the plants, as that might check the succeeding growth of the leaves. This plan is obviously confined to ewes or store sheep.

It is doubtful, however, whether the expense of cultivating this sort of crop, except in particular soils, situations, and severe feasons, will admit of its being used as a winter sheep food in preference to turnips, or other similar articles of fodder.

*Borecole*, in *Botany*. See *Brassica*.

*Boree*. See *Bourbee*.

*Boreel* Conex, in *Biblical History*, a MS. noted F. in the first part of Wetstein's N. T. which contains the four gospels, beginning with Matth. vii. 6. and having the two following chapters, Matth. xiii. 26—58. and Mark vi. 6—16. It was formerly in the possession of John Boreel, Dutch ambassador at the court of London, in the reign of James I. Its present situation is unknown.

*Borek*, in *Geography*, a town of Poland, in the palatine of Kalish; 28 miles W. of Kalish. Here is a famous image of the virgin Mary, to which pilgrims resort.—Alfo, a small town of Bohemia, in the circle of Saaz.

*Borel, Peter*, in *Biography*, born at Castres in Languedoc, about the year 1620, after being initiated in classical literature by his father, James Borel, from whom he also received
ceived a taste for poetry, and for antiquarian researches, prosecuted his medical studies at Montpellier, where he was admitted doctor in medicine, in 1641. Returning to Castres, he acquired so much reputation by his practice there, that in 1653 he was invited to Paris, and made physician in ordinary to the king; and, in 1653, member of the royal academy of sciences. Borel was a diligent collector of natural and artificial rarities, of which he left a cabinet well flored. His publications are, "Les Antiquitez, raretés, plantes, minéraux, &c. de la ville et comté Castres, et un recueil des inscriptions Romaines du LangUEDoc et de Provence, avec la liste de principaux cabinets et autres raretés de l'Europe," Castres, 1649, 8vo. The titles of the articles in his own cabinet are here given: "Historiarum et observationum medico-physicarum, continet quatuor," Castres, 1653, 12mo. A few of the cates are curious and interesting, but far the greater number of them are too insignificant to deserve notice, or too extravagant to be credited by persons who are only moderately instructed in the principles of medicine. To this volume are usually joined the observations of Cattier, of Rhodos, of Arnold Boet, and the confutations of Rossiis, "Bibliotheca chymica, feu catalogus librorum philosophicorum hermeticorum," Parisii, 1654, 12mo. "De vero inventore telecopii, cum brevi ommni ostentorum historia," Hage Comitis, 1655, 4to. "Tres des recherches et antiquitez Gauloises." "A dictionary of words and phrases, which had become obsolete," 1655, 4to. "Diecurs prouant la pluralité des mondes," Geneve, 1657, 8vo. "Hortus, seu armafactarium simplicium plantarum et animalium, ad artem medicam pertinentium," Parilisii, 1666, 8vo. To each of the articles, which are arranged alphabetically, the author has given a short account of its medical properties. Borel died at Paris in 1678. Haller Bib. Anat. Med. Botan. Eloy Déc. Hist.

Borelli, John Alphonse, distinguished for his profound skill in mathematics, and in medicine, was born at Caletelnuvo in Naples, the 28th of January 1608. Under the tuition of Caletelli, at Rome, where he was sent to complete his education, he made such progress, that he was, at an early age, invited to Messina to teach the mathematics. As he had made medicine, as well as philosophy, his study, he there published an account of a malignant fever which had raged in Sicily, in the years 1647 and 1648. "Delle regioni delle fibrie maligni di Sicilia," Cofenza, 1649, 12mo. Dignified, at length, with his employers, he accepted the offer of the professor's chair at Pisa, in 1656, where he lectured with great applause and success. The fame of his abilities had now conciliated to him the favour of the grand duke Ferdinand, and prince Leopold, who procured him to be elected member of the academy del cimento. It was here probably he first conceived the design of employing mathematical principles, in explaining the functions of animal bodies. He now applied himself diligently to the instruction of animals. Several of his letters, on the subject of anatomy, are published in Malpighi's posthumous works, written between the years 1659 and 1664. In 1658 he published, at Pisa, a second treatise on the nature and treatment of malignant fevers. "Della caufe, delle fibrie maligne," 4to. His first physiological work, "De rerum us us judicium," appeared in 1664, with the treatise of Bellini, "De structura rerum," printed at Strasbourg, 8vo. In 1669, he gave a dissertation, in which he advanced the eyes have unequal powers, the one observing objects more distinctly than the other. "Observazione intorno alla virtu inequale degli occhi," Giorn. de Lit. In 1667 he published, "Tractatus de vi percussionis," Bonon. 4to.; and in 1669, "Obser-

vations on a remarkable eruption of mount Aetna," at which he had been present, having the preceding year quitted Pisa, and returned again to Messina. This account was written at the desire of the royal society of London, with which he corresponded, and was printed in their transactions. In 1770, he gave his treatise "De motibus naturalibus a gravitate pendentibus," a prelude to his great work, "De motu animalium," which did not appear until after his death. At the revolt of Messina, being supposed to have favoured the insurgents, he was obliged to quit that place. Christlina, queen of Sweden, who resided at that time, at Rome, invited him thither, and he continued to enjoy her patronage to the time of his death. That he was not, however, much enriched by her favour, nor had acquired much by his lectures, and by the works he had published, appears by his being obliged, during the two last years of his life, to undergo the drudgery of instructing youth in mathematics, at the convent of St. Pantalon, called the pious schools, where he died of a pleurisy, December 31, 1679, in the 52d year of his age. The first volume of his work, "De motu animalium," appeared in 1680, Rom. 4to. It is dedicated to Christlina, and was printed at her expense; and the second, which completed his design, in the following year. Borelli's principal intention in this work, was to explain the functions of animal bodies, on mechanical principles. He describes the fibres of the muscles, which he supposes to be vesicular; and that these vessels become inflamed by a portion of the nervous juice falling into them, and mixing and fermenting with the blood they contain, whence the muscle becomes swollen, and its fibres shortened. He measures the degree of force or power each of the fibres possesses, and the power of them collectively, which, according to his estimate, is immense. He shows how that power is increased or diminished, by the manner in which the fibrous fibres are joined to the tendons. He calculated the power of the heart, in propelling the blood, which he supposed was equal to 180,000 pounds in weight. Though Borelli in this and other of his calculations was shown to have erred considerably, yet his general principles were for a long time after acknowledged and adopted, and even the operations or effects of medicines, on the human body, were supposed to be explicable on mechanical principles. He also invented an apparatus by which perous might go down a considerable depth under water, remain there, move from place to place, and sink or raise themselves at their discretion; also a boat in which two or more persons might row themselves under water. Haller Bib. Anat. Gen. Biog. Philos. Transact. abridged, vol. ii.
fary to lengthen the instrument: and this may be repeated, by the addition of more rods, to any depth desired; &c. Fig. 1. is the handle of this instrument, two feet and a half long; and is held at the hand, by the handle being fastened to the rod by means of a clap, 4, fixed in the lower end of one rod by a hinge, and at the other by the screw B, so that it may be placed at any height.

Fig. 2. is the handle separated from the rod, and marked with the rod, with the same letters as before. Fig. 3. is another handle, or rather lever, like the handle already described, except its having only one branch, or lever, marked g. This serves to flop the borer in bringing it up from a confiderable depth; and also to screw and un- screw the several bars or joints as occasion requires, and to put on and take off the steel point at the bottom. The handle g, by means of a screw, is that by which the rod is held, and is brought into the earth, either by twisting it round, especially at first, or, after it has penetrated to some depth, by lifting it up, and letting it fall again, which it does with such force as to pierce even the hardest rocks; especially if it works at any confiderable depth, and has of course been lengthened accordingly: for every foot of this rod weighs three pounds. Two men will easily find the depth of twelve feet in 1.5. than a quarter of an hour, if they do not meet with many stones. When the rod becomes too heavy to be properly managed by hand, it may be raised by a rope fastened at one end of the handle, and at the other to a roller, or kind of windlass, erected at a proper height, perpendicular over the hole, and turned with either one or two handles. This will cost but a trifle, and easily raise the rod, which, when let go, will fall with such weight as to strike each time very deep into the earth. The marquis de Turbilly observes, that he has seen it wrought in this manner to the depth of more than a hundred feet.

The toughflft iron is the best for making this instrument, which should be well hammered, till its surface is quite smooth and even; for the least roughness and inequality would occasion friction, which would greatly retard its working. For the same reason, and also to incerase the force of its fall, it is necessary that it should be perfectly straight; nor should it ever be struck with a mallet, hammar, &c. to force it down, because a blow might bend it, and it would easily break afterwards. The female screw must be turned like that in the breech of a gun-barrel, in a separate piece of iron, crofs-ways to the grain; and this piece must be afterwards well folded on to one of the ends of the rod.

The reason for this is, that if the female screw were bored only at the end of the rod, it would, by being hammered out in the same direction with the grain, be fringy and porous, and consequently too weak as to give way, or burrf, in the working of the rod; whereas, when made of a separate piece, taken crofs-ways to the grain, the threads of the screw will run with the grain of the iron, and be the more considcrably strengthened. A bar like that of an auger, proportioned to the thickness of the rod, may at any time, when necessary, be substituted instead of the steel point, to draw up a sample of the subfance from the very bottom of the founding. If the only thing wanted be to know the nature of the under foil, and layers of earth, so far as they may affect the vegetation of plants, it will be quite sufficient to bore eight or ten feet deep. A greater depth is only requisite, when water, marble, ore, &c. is sought for, but the common auger may do very well for shallow boring.

By either of these implements there is a certainty of discovering, without much charge or any hazard, not only what earths are under the upper foil, but also whether any other substance of value lies concealed there, such as marble, chalk, fullers' earth, fossile shells, coals, quaryes of slate or stone, cres, &c. many of which lie hid and entirely un- thought of in places where their value, if it was known, would be ten times more than that of the elleate which covers them.

BOREM, in Ancient Geography, a mountain of Greece, in the Peloponnesus, placed by Leofandus, in Arcadia.—Also, the name of a port in the isle of Tenedos, according to Arrian.—Also, a promontory of Africa, in the Cyrenaica, at the extremity of the gulf of the Syrtes Major. Published.

BORG, or Boro, in Geography, a town of Denmark, in the island of Femern. N. lat. 55° 50', E. long. 17° 58'.

BORGARUCCI, Prosper, in Biography, an Italian physician of eminence, who flourished about the middle of the 16th century. After attending the lectures of Vesalius for some years, he travelled into France, Holland, and England, to improve himself in medical knowledge. On his return he published "Della contemplatione anatomica sopra tutte le parti del corpo umano, libro quindices," 8vo. 1565, Venet. Some of his observations are made, in this volume, on the great anatomical work of Vesalius, whom our author, however, never met with respect. "Trattato di pellic," Venet. 1565, 8vo. "De morbo Gallino methodus." Though he describes the method of curing the lues with mercury, he profess the use of guinacum, believing that men from using mercury were rendered incapable of procuring. He makes no mention of sarsaparilla, or the China root, though well known in his time. This tract is inserted by Leofandus in his collection of treatises on the disaease. Borgarucci taught anatomy and medicine at Padua for some years. In the year 1567, he was called to France, where he was honoured with the title of physician to the king, which he afterwards used. The time of his death is not known. A. de Morb. Ven. Haller. Bib. Anat. Elov. Dict. Hist.

BORGE, in Geography, a town in the island of Cephalonia; 2 miles S. of Cephalonia.

BORGFIORD, or Borga-fiorder, a fylfjord or district of Iceland, in which are warm baths, built in the 13th century, by the famous historian Snorri Sturlan. They are so spacious and so well contrived, that 100 persons may bathe in them at the same time. Near these is the crofs-bath, in which the inhabitant of the western parts of Iceland were baptised, in A. D. 1000; whence its name.

BORGENTRICK, or Borrenar, a town of Germany, in the circle of Welfphalia, and bishopric of Paderborn; 5 miles N. E. of Warburg.

BORGHETTO, a town of Italy, in the Lodefane, 2 miles S. of Lod. Also, a town of Italy in the state of Genoa. 8 miles N. E. of Albenga.

BORGHINI, Vincent, in Biography, a learned bi- dician, was born of a noble family at Florence in 1514, and entered among the Benediciines in 1531, devoting himself to study and the offices of a religious life. Duke Cosmo appointed him prior to the hospitall Sta. Maria degli Emanenti at Florence, and he performed the duties of this station with great benefit to the institution, declining the archbishopric of Pisa, till his death in 1560. His reputation for acquaintance with the purity of the Tuscan dialect was such, that he was entrust with the publication of a corrected edition of the decameron of Boccacio in 1573; and to him are ascribed the annotations and discoveries that accompany it. His own principal work consisted of two volumes of "Diforci," printed.
printed at Florence in 1584 and 1585, 4to., which comprehend twelve dissertations on the origin and ancient state of that city, and of others in Tuscany, abounding with a variety of curious erudition. He was likewise well skilled in painting and architecture; and he was entrusted by duke Cosimo with the decorations for the nuptials of his son Francis, and named by him as his subtile in the academy of design. Several of his letters are published in various collections. Gen. Biog.

BORGHOLM, in Geography, a town of Sweden, in the island of Oeland. Near it is the commodious harbour of Borga.

BORGHOLZHAUSEN, a town of Germany, in the circle of Weilphalia, and county of Ravenburg, 6 miles S. W. of Hervorden.

BORGHORST, a town of Germany, in the circle of Weilphalia, and bishopric of Munster; 3 miles E. of Steinfort.

BORGI, in Ancient Geography, a people of Asia, placed by Ptolemy in Asia.

BOGIA, Cesar, in Biography, a man whose dire ambition deservers to be configned to perpetual infamy in the page of history, was the second son of cardinal Rodrigo, (afterwards pope Alexander VI.) by his mistress, the artful Vanozza. As he was designed for the church, he was invested, whilst a child, with the archbishopric of Pamplona, and sent to Pisa for his education. As soon as his father was elected to the papal see, in 1492, Borga hastened to Rome, expecting to share in those dignities which his father's elevated station empowered him to demolish. On his arrival, Alexander received him with a grave aspect, and with a lecture on the necessity of restraining his ambitious views, and of seeking honour in the path of virtue. This mode of reception was neither suited to the character of the father nor to the disposition of the son; but the mother of Borga soon quieted his mind, by affording it to its true caufe, the artifice and hypocrisy which Alexander thought it necessary to practise on his elevation to the papal throne. Notwithstanding this lesson of moderation, Borga was immediately made archbishop of Valletta, and, in the following year, promoted to the dignity of cardinal. When the French army, under Charles VIII. entered Rome, in their expedition against Naples, and compelled the pope to a treaty, Borga was obliged to accompany the king as apostolical legate, or rather as an hostage for the performance of the stipulated conditions; but finding an opportunity to make his escape, and to return to Rome, the treaty was broken, and the king was under a necessity of leaving Italy. About this time Vanozza urged a complaint against the French for having plundered her property, and excited both Alexander and her son to revenge the injury she had suffered. Accordingly they began with administering poison to Gene, brother to Bajazet, who had fled to Italy, as to a sanctuary, from that Sultan, and whom the French wished to have in their possession, because, after the taking of Naples, they projected an expedition against the Turks. Not satisfied with this violation of the obligations of hospitality, they proceeded, by means of affinities, to destroy the French who remained at Rome. Borga, perceiving that his elder brother, the duke of Gandia, obstructed him in the career of his ambition, and that he was his rival in an amour with a lady, said by force to be their own sister, Lucretia Borgia, who was also a very particular favourite of her father, determined to get rid of his competitor. Accordingly, on the eve of his departure to the king of Naples, under the character of his legate a latere, he contrived means to affinate his brother. This event happened in the year 1497. After the accession of Lewis XII. to the throne of France, pope Alexander entered into a negotiation with him, particularly with a view to the promotion of his son. For the more effectual attainment of the objects of his ambition, Borgia resigned his dignity of cardinal; and proceeded as ambassador to France, where Lewis created him duke of Valentinois, granted him a pension, and appointed him to a command of cavalry. At this time Lewis had solicited the pope for a dispensation to divorce his wife, and to marry Anne, duchess of Burgundy; and the dispensation for this purpose was conveyed by Borgia. Borgia, however, retained it in his possession, in order to enforce his interdict with the king, for obtaining Charlotte, daughter of the king of Naples, who was intended by his father Alexander for his wife. But pretending that he was in daily expectation of receiving the dispensation from Rome, and delaying the delivery of it, the king became impatient; and applying to the bishop of Setta, who was then the pope's nuncio at Paris, he was informed, that Borgia had brought it with him to France. Upon this Lewis convened a number of divines, who authorized him to divorce his wife, and to marry Anne of Burgundy. The marriage having been concluded, Borgia was at length obliged to deliver the dispensation to the king; but he revenged himself on the nuncio by a dose of poison, which proved fatal. Charlotte rejecting his addresses, on account of his infamous character, he married the daughter of the king of Navarre, and was honoured by Lewis with the order of St. Michael. The father and the son, powerfully protected by France, co-operated in a variety of barbanous affimations, partly for the purpose of revenge for real or imagined injuries, and partly with a view of feizing the property of those whom they dispatched, in order to carry on an unjust war, which they had undertaken. The pope, having formed a design of reducing the territory of Romagna to the obedience of the holy see, intended to form it into a principality for his son. Borgia, now duke of Valentinois, came from France with a considerable force, in order to accomplish the purposes of his father; and began his campaign with the siege of Imola and Forli, which soon succumbed; and he afterwards reduced Pifarco, Rimini, and Faenza.

In 1501, Borgia obtained from his father the title of duke of Romagna. In the course of this war, conducted with a ferocity and spirit of rapine and revenge seldom paralleled, he proceeded with such success, that the Italian powers were at length alarmed, and formed a confederacy against him. He contrived, however, to defeat this combination, to detach some parties from the alliance, and, with his accustomed perfidy and cruelty, to invite three of the heads of the association to Senigajia, under a pretence of establish ing peace, and to cause them to be strangled. Borgia and his father concurred in all these detestable measures, and by their united arts, alternately courted the powers of France and Spain, as each appeared to have the greatest influence in the affairs of Italy. In 1503, Borgia bore his father, who was supplicating to have died by poison, which they had prepared for a rich cardinal, whose estate they wished to appropriate to themselves, but which they both took by mistake. It proved fatal to the father; but the son, by strength of constitution, escaped with his life, though he long experienced its pernicious effects. Upon the ascension of pope Pius III. Borgia came to Rome with a great retinue; but being universally detested, he avoided the affaults of his enemies by sheltering himself in the Vatican; and his life was preserved by the protection of the king of France; but he afterwards, with base ingratitude, quitted his party, and joined that of Spain. During this interval, many of the towns in his territory of Romagna were feized by the Venetians; and pope Julius II.
BORGIAN MS. in *Biblical History*, a fragment of a Coptic-Greek MS. brought by an ignorant monk from Egypt, containing about 12 leaves, sent to Stephen Borgia, secretary to the Society de propaganda fide. It begins with John vi. 28. and ends vii. 23.; and is divided into two columns, the first containing the Greek text in the Coptic letters, and without intervals between the words, and the other containing the Coptic. It is an important specimen, says Michaelis, of the Alexandrine edition; and he greatly laments that so much of it is lost. Professor Birch, who collated this MS. described it in his Prelogomena, p. 49, and communicated its various readings in his Greek Testament. The whole of it is printed in "Georgii Fragmentum Graeco-Coptico-Thebaicum," Rome, 1789, 4to. Birch has likewise described and communicated the readings of two other Borgian MSS.; one supposed to be of the 1st century, containing the four gospels, and the other of the 12th, containing detached parts of the gospels, and of St. Paul’s epistles.

BORGIAN, in *Geography*, a town of Perizia, in the province of Segeliam, 90 leagues south of Zareng.

BORGIANI, ORAZIO, or HORAZIO, in *Biography*, a painter of history and portraits, and an engraver, was born at Rome in 1630; instructed in the art of painting by his brother, Giulio Borgiani, called Scalzo; and by studying the capital performances of ancient and modern artists, in his native city, he made such progress in his art, that his works were held in high estimation in Spain, where he resided for some time. Upon his return to Rome, he was employed in considerable works for chapels and convents, and also in painting portraits, by which he acquired honour, and lived in affluence. His etchings were performed in a bold and free manner; and more finished than usual, when considered as the works of a painter. His drawing is not correct; but the style is masterly, and the effect agreeable. His most finished etching is said to be a “dead Christ,” with the figure very much foreshortened, and behind the two Maresias and St. John, who is killing one of the hands of our Saviour; from a composition of his own, dated 1645. His death, which happened in 1681, was occasioned by the malicious treatment of an envious competitor and contemporary, whose name was Celio. Pilkington and Strutt.

BORGIE, in *Geography*, a town of Africa, in the province of Zeb or Zebib, about 5 leagues from Bicara; a town much more populous than the latter, and the residence of a great number of merchants, mechanics, and labourers of all kinds.

BORGLUM, a prefecture of Denmark, in the diocese of Aalborg, including 14 parishes.

BORGNE, I.E., a town on the north side of the northern peninsula of the island of St. Domingo, 3 leagues west by north from port Margot, and 8 sail by south from Port de Paix. N. lat. 19° 49’.

BORGO, a town of Sweden, in the province of Nyland, in the gulf of Finland, 21 miles N.E. of Helsingford. This is an ancient sea-port, with an indifferent harbour, a bishop’s See, and a good fermy. The inhabitants trade in all kinds of linen. Borgo gives name to a distriet.

BORG, a town of the Tyrol. N. lat. 46°. E. long. 11° 30’.

BORGODES, in *Ancient Geography*, a people placed by Pliny in Arabia Felix.

BORGOFORTE, in *Geography*, a town of Italy, in the duchy of Mantua, at the conflux of the Oglio and the Po; 8 miles S.S.W. of Mantua.

BORGOFRAICNA, a place of small note in the principality of Piedmont, and marquisate of Ivrea, 22 miles north of Ivrea.

BORGIO DI FORNARI, a town of Italy, in the republic of Genoa; 10 miles north of Genoa.

BORGIO MANERO, a small place in the duchy of Milan, and distriet of Novara; 12 miles N.N.W. of Novara.

BORGIO DI ST. DOMINO, a small town of the duchy of Placentia, though it is the see of a bishop, suffragan of the archbishop of Bologna, and the capital of the distriet; 12 miles N.W. of Parma.

BORGIO DI ST. SEPOLCRO, a town of the duchy of Tuscany, situated near the source of the Arno, on the borders of the ecclesiastical state, with a fort on a rock; the see of a bishop, suffragan of Florence, and city of the pope; 48 miles E.S.E. of Florence, and 12 N.E. of Arezzo.

BORGIO DI SERRA, a town of the duchy of Milan, in a district called “Val di Sèfia;” 22 miles N.W. of Novara.

BORGIO DI VAL DI TARO, a town of the duchy of Placentia, seated on the river Taro, in the district called “Val di Taro;” 23 miles S.W. of Parma.

BORGSTALL, a town and bailiwick of Germany, in the circle of Upper Saxony, and Old March of Brandenburg; 12 miles S.S.W. of Stendal.

BORKA, or BORgression, a town of Spain in Arragon, seated at the foot of an eminence near Cayo, and in a country which produces plenty of grain, wine, oil, hemp, flax, and moifs kinds of eulcent plants; 34 miles W.N.W. of Saragossa.

BORKA, a town of Peru, situated on the head waters of the Amazon river.—Alto, a town in Brazil, on the southwestern bank of Uruguay river. S. lat. 29° 15’. W. long. 56° 50’.

BORIN, in ornithology. Under this name Aldrovandus, Ray.
Ray, Willoughby, and other old writers describe the paffarine varibr, *potasilla paffaria*, Gmel.

BORING, the act of perforating a solid body, or making a hole throughout its whole length or thickness.

Surgeons speak of boring the bones of the skull, properly called trepanning.

*Boring Birch*, and other trees, is practised in the spring for their juice, called also tapping and bleeding. Phil. Trans. N° 44. p. 880. See Betula.

Boring, in *Farriery*, an operation formerly practised for the cure of horses whose shoulders are wrenched. The method is thus: they cut a hole through the skin in the middle of the shoulder, and with the flanks of a tobacco-pipe, blow it as a butcher does a shoulder of veal; then they run a cold flat iron, like a horfeman's sword-blade, eight or ten inches up, between the shoulder blade and the ribs, which they call boring; after that they burn him round his shoulder with a hot-iron. This, says Bartlett, is an absurd and useless, as well as a cruel practice.

*Boring of Mills*, from top to bottom, is proposed by Dr. Hook, as a means of strengthening and preferring them; as this would make them dry and harden the better, and prevent their cleaving and cracking. For want of this, the outside drying, when the inside does not, the former shrinks faster than the latter; the consequence of which is prejudicial.

*Boring*, in *Mineralogy*, a method of piercing the earth by a set of scooping irons, made with joints so as to be lengthened at pleasure. The skilful mineralist will be able to guess where a vein of ore may lie, though there are none of the common outward signs of it upon the surface of the earth; and in this case he has recourse to boring; the scooping irons are drawn back at proper times, and the samples of earth and mineral matters they bring up, are examined; and hence it is known whether it will be worth while or not to open a mine in the place. See Coal.

*Boring*, in *Rural Economy*, a practice sometimes employed in order to ascertain the nature of the different strata that lie beneath the surface soil; and also for the purpose of discoverying springs, and tapping them, so as to draw off the water that injures the grounds below, or in the neighbourhood. When this last object is in view, boring is generally performed in the bottoms of ditches or drains, previously made in the land, to the depth of several feet. See Draining of Land.

*Boring Auger*, an implement employed for the purpose of boring the soil, and letting off water confined beneath it, &c. See Borer.

*Boring of Water-pipes*. The method of boring alder poles for water-pipes is thus: being furnished with poles of a fit size, horfes, or trefills are procured of a due course, both to lay the poles, and ret the augre on in boring; they also set up a fath, whereby to turn the lesser ends of the poles, and adapt them to the cavities of the greater ends of others, in order to make the joint fit each pair of poles together. The outer, or concave part, is called the female, and the other, or inner, the male part of the joint. In turning the male part, they make a channel, or small groove in it, at a proper distance from the end; and, in the female part, bore a small hole to fit over this channel; they then bore through their poles, flicking up great nails at each end, to guide them right; but they commonly bore a pole at both ends; so that if it be crooked one way, they can nevertheless bore it through, and not spoil it. Neve Build. Dict. in voc. Alder.

This operation is now performed with a horf-mill, as at Donlet Stairs for the New River company.

Belidor, in his *Hydraulics*, has described a machine in which a water-wheel is made use of both to turn the augre, and to bring forward the carriage on which the pipe to be bored rests. This machine (see T. II. *Mechanica*, f. 67.) is put into motion by the water-wheel A, in the axis of which there is a cog-wheel B, that turns the lanterns C and D; the pendulums D turn two small wheels F and F': the fulc of which is vertical and turns the augre; the other is horizontal and moves the carriage by means of the two arms H and L. H draws the wheel G towards F; and it presses it in a contrary direction; and these combined actions cause the carriage to advance towards F, and the augre to bore the pipe. The augre being about twelve feet long and proportionally heavy, is supported by the pieces L L; and they are prepared so as to give no obstruction, in the following manner: C C, (fig 63.) are two planks of wood which are fastened to the timber-work of the mill; these encompass another plank, hung by a cord, at the bottom of which are fixed the pieces b b, with joints at c and e; and, that they may not move out of the vertical plane, they are joined by tenons to the plank a, in which they may work freely: on the side of one of these pieces is fixed a spring, g, in order to hinder them from uniting, by forcing them into a mortise, in d; in this situation the two pieces are penetrated with a hole through which the augre is to pass. The cord is fastened to the plank a, as in fig. 69, and goes over the two pulleys b b; at the other end of the cord there is hung a weight e, resting on the piece N, which is supported at one end by the piece O, and fixed to the other by a joint to the lever K, which has its centre of motion in the piece of wood H; so that, leaning against the extremity M of the lever, N quits the support O, the weight sinks down, and draws up the piece a; then the sides b b, fig. 68, quit the mortise d, and the spring g separates them; and thus the supporter does not in the least hinder the motion of the augre.

**Borjoktit**, in *Geography*, a town of Poland, in the palatinate of Podolia; 28 miles call of Kaminicze.

**Boriuen**, See Bier.

**Boriquettta**, a province of South America, in the country of Terra Firma.

**Borissolens.** See Barissoglesben.

**Borith**, in the *Holy Scriptures*, an herb thought to be the kaly, or fallwort; of the ashes of which some make soap, and a very good key to wash linen with. It is mentioned in Jeremiah, chap. ii. ver. 22.

**Borkah**, or *Ardu*, in *Geography*, an ancient empire of the Ascanian Turks, which extended on this side of the Volga from Ubiec, near Saratof, quite to mount Caucassus. Some of thise were called Kunemi or Komai, from the river Kunne, and their town was named Kumage.

**Borkan**, a town of Perias, in the province of Larilian, 64 miles S.W. of Lar.

**Borkeloe.** See Borkelo.

**Borken.** See Borch.

**Boren**, a bailiwick of Germany, in the landgrave of Helfe, confilling of eight villages, and a small town of the same name, become almost extinct.

**Borknowka**, a town of Poland, in the palatinate of Podolia, 20 miles W.N.W. of Kaminicze.

**Borla**, William, in *Biography*, an eminent topographical writer, was born of an ancient family at Pendeen, in the parish of St. Juft, Cornwall, in 1666; and having finished his grammatical education at Penranc, Tiverton, and Plymouth, was entered at Exeter college, Oxford,
ford, in 1713; where, in 1719, he took the degree of master of arts. In the following year he took priest's orders, and in 1722 was inducted to the rectory of Ludgvan in Cornwall, on the presentation of the duke of Bolton; and this, with the vicarage of his native parish, was the only preferment he ever obtained. At Ludgvan his situation was pleasant and retired; and he applied with exemplary industry to the duties of his profession, and to those studies of natural history and antiquities, to which his inclination led him. The parish of Ludgvan abounded with mineral and metallic fossils; and the various parts of Cornwall presented to his research many judicial remains. To these objects his attention was directed; and he commenced his literary career with "An Essay on Cornish Crystals," which he communicated to the Royal Society, and which produced his election into that society in 1749. In 1754, he published, in folio, his "Antiquities, historical and monumental, of the county of Cornwall, consisting of several essays on the ancient inhabitants, Druid superlision, customs and remains of the most remote antiquity in Britain and the British isles, exemplified and proved by monuments now extant in Cornwall and the Scilly islands; with a vocabulary of the Corn-British language;" a learned and judicious work, free from long digressions and fanciful hypotheses, in which antiquarian writers have indulged themselves. A second edition of this valuable work, with several additions, a map of Cornwall, and two new plates, was published at London, in 1769. His next publication was "Observations on the ancient and present state of the islands of Scilly, and their importance to the trade of Great Britain," 4to. 1756. This was followed, in 1758, by his "Natural History of Cornwall," which was justly considered, at the time of its publication, as a very important accession to the mineralogical history of Great Britain. Soon after this publication he presented to the Ashmolean museum at Oxford, a variety of fossils and remains of antiquity, for which he received the thanks of the university, and the honour of the degree of doctor of divinity. Having completed his three principal works, and attained the age of more than 60 years, he persevered in his application to his favourite studies, and in his diligent discharge of the duties of his profession. His communications to the Royal Society were very numerous; and some or other of his papers may be found in its Transactions from the year 1750 to 1772. With a view to his own amelioration and improvement, rather than with any design of publication, he composed paraphrases on the books of Job and of Solomon, and wrote other pieces of a religious kind; and he prepared for the press a treatise, which he had written some years before, concerning the "Creation and Deluge," but increasing infirmities prevented its being printed. His decline commenced with a fever in feb in the beginning of the year 1771, and terminated in his decease on the 31st of August 1772, in the 77th year of his age. He was much esteemed by all who knew him, as a kind father, affectionate brother, sincere friend, instructive pastor, and good citizen; and as a man of condition whose life had been devoted to important and useful pursuits. He had fix sons, two of whom survived him, and they were both in the church. Dr. Borlace furnished Mr. Pope's grotto at Twickenham with a great number of the materials that were used in forming it. In Mr. Pope's letter of acknowledgment, he says, "I am much obliged to you for your valuable collection of Cornish diamonds. I have placed them, where they may be seen by yourself, in a fiddle, but shining," alluding to the obliquity of the donor's situation, and the brilliancy of his talents. B. Brit.

BORMES, in Geography, a town of France, in the department of the Var, seated on the coast of the Mediterranean, near a flat shore, which serves for a port; and a basin, which cannot reach the gulf of Hiero before a temporary estuary, 3 leagues E. of Hiero.

BORMIDA, or Bormia, a river of Italy, which runs into the Tanaro, near Alexandria.

BORMIO, a county in the territory of the Grisons, lying at the foot and in the midst of the Rhetian Alps, and bordering upon Engadins, the valley of Munster, the Valteline, Tyrol, Trent, and the Venetian territories. It is entirely inclosed within the mountains, except a narrow opening, which connects it with the Valteline; the other access to it lies across the rugged Alps, and in winter are frequently impassable. This country, which was once a part of the Milanece, became subject to the Grisons in 1512. (See Valteline.) It is divided into five districts; viz. Bormio, comprising the capital and several dependent villages; the valley of Vurba; the valley of Pedinofo; the valley of Cepino; and the valley of Luvino. In the new division of Switzerland, since the French revolution, the county of Bormio, with the Valteline and Chiavenna, form a part of the Cisalpine republic. Whilst it remained under the government of the Grisons, its inhabitants were exempt from the oppressions exercised by the Grison governors in the other countries subject to their dominion. They paid a fixed and moderate contribution; they collected and enjoyed their own duties upon exports and imports, and were thus secured from injudicious and oppressive taxes; the fines for criminal offences belonged to the community; and as no part was assigned to the governor, he was not interested in convicting criminals; and the chief privilege, which distinguished this country from the Valteline, was the freedom of its government, and the limitation of the podesta's authority.

The supreme magistracy of Bormio, called "Podetta," was sent from the Grisons, and continued two years in office; his authority was very circumscribed, and his power was almost wholly dependent on the concurrence of the councils. In those councils he never gave a vote, except in cases of equality; he imposed not the power of arresting a criminal, nor of pardoning or levying the punishment. His annual stipend of about 80l. arose partly from a payment of money, partly from an allowance of rye, and partly from the evils of theft and criminal causes. The supreme authority resided in the podetta, and councils, consisting of a civil and criminal tribunal, the members of which were annually chosen by the people. The criminal court, or council of sixteen, changed every four months, consisted of two regents, the treasurer, the notary, and 16 councillors, of whom ten were taken from the town, and two from each of the valleys of Vurba, Pedinofo, and Cepino. This council was convened by the podetta, at the request of the two regents. In order to arrest a criminal, it was necessary to assemble the whole council, or at least seven of the members; in other important cases, the podetta and two regents might give an order of arrest; but this was deemed contrary to law. The process, conducted by the podetta and two regents, was laid before the council; and upon conviction of the criminal, provided he did not confess his crime, the majority of the council determined whether the evidence was sufficient to justify torture; which was applied in the preference of the podetta, the two regents, the treasurer, and notary. If the proofs were insufficient for conviction, the podetta and councillors received nothing for their attendance; a regulation, which sometimes induced the judges to straiten flight circumstances into proofs of guilt; and not unfrequently occasioned the infliction of torture.

The civil tribunal consisted of twelve members taken from the
the town of Bormio; and from their decision an appeal lay to the syndicate of the Grifions.

The members of these councils were chosen annually by the assembly of the people. In the choice of the two regents, fix persons selected in a peculiar manner by the regent last in office and the treasurer, chose six members of the assembly, three from the district of Bormio, and three from the valleys, who appointed six candidates; the names were then thrown into fixed bags, and balled for; and the two, who had the greatest number of ballots, were regents, who remained in office only four months. The revenue of the country amounted in one year to 221. 14s. 4d.; and the average expenses to 212. 2s. 2d. The expenses and receipts are submitted, when the regents retire from office, to the council of fifteen, and cannot pass without their approbation.

The county of Bormio is about 15 miles in length, and 14 in breadth; and the inhabitants are estimated at about 14,000. The mountainous parts produce only pasture and wood; the lower districts in Bormio yield corn, but not sufficient for domestic consumption. The inhabitants export cattle, a small quantity of cheese, and iron, obtained from the mines of Freh, in the valley of Pechino, wrought at the expense and for the profit of a private person, who pays to the community a small annual rent. The honey produced in Bormio is esteemed excellent. Wine is imported from the Valcine, corn from the Tyrol, corn and rice from Milan, linen from Bergamo and Appenzel, and cloth from Germany. The air is cool, but pure and healthy. The established religion is the Roman Catholic; and the exercise of every other worship is prohibited. Spiritual affairs are under the jurisdiction of the bishop of Coire, who has a vicar's court at Bormio, in which all ecclesiastical causes are tried. The priests have peculiar privileges, which are extended even to those who wear a clerical dress. Most of the peasants possess a small portion of land, and, in consequence of the freedom of the government, are happier than the people of the Valcine and Chiavenna. Coxe's Travels, vol. iii.

Bormio, the capital of the county of the same name, is situated at the foot of the mountains, close to the torrent Fredolfo, which falls at a small distance into the Adda. It contains about 1000 inhabitants, but has a desolate appearance, the houses are of plastered stone, of which some make a tolerable figure, amidst many with paper windows; and several, like the Italian cottages, have only wooden window shutters. The palazzo, or town-house, contains a suite of wretched rooms for the residence of the podesta, a chamber for the courts of judicature, and an apartment where the representatives of the people assemble. In one of the rooms is an engine of torture, which, in defiance of common sense as well as humanity, is still used in these countries to force confession. The archives are kept in an apartment, the door of which has several keys; so that all the magistrates, who are entrusted with them, must be present, whenever it is opened. The most important of the papers kept in these archives is the charter, by which the Grifions confirm, in the most ample manner, the immunities granted to this country by the dukes of Milan; it was passed in the diet of Tintz, under Paul, bishop of Coire, in 1513, the year succeeding that in which the Grifions annexed Bormio to their dominions. Many circumstances have concurred to deter the Grifions from infringing this charter; the two principal are, the situation of Bormio on the confines of the Tyrol, whence they might receive assistance from the house of Austria; and the spirit of freedom which distinguishes the inhabitants, who have watched with a jealous eye the light-
mented with those of the French revolution. The emperor Joseph feems to us at this time not to have been adecive to such co-
adjutors; and he appeared to be pleased with a witty and popular publication of Born, in 1783, entitled "Monacholo-
logia," which was a severe attack on the monks, whose he charac-
terized in the technical language of natural history, under the regular division of order, genera, and species, ufed in the Linnean school. The clergy complained, and their complaints were retorted by Born with more bitter farces, exceeding the bounds of prudence and candour. He de-
defended his associates, the "Illuminati," with great zeal; and when the elector of Bavaria ordered an order to dismiss all of this fraternity from his service, Born returned to the academy of Munich the diploma by which he had been admitted as one of its members. The emperor Joseph gradually withdrew his support from these reformers, whom he had at first encouraged; and Born's continued influence was principally owing to his skill in mineralogy and metallurgy, by which he was capable of rendering service to the state. In the pro-
cess of extracting the noble metals from their ores, by amalg-
amation with quicksilver, he manifested his superior skill; and to this purpose, a decisive experiment was performed at Chemnitz, by the emperor's order, in the presence of Char-
pentier from Saxony, Ferber from Russia, Elhijar from Spain, Podà, and other celebrated chemists, which met with univer-
sal approbation, and established the utility of his discovery.

In 1786, Born published, at the desire of the em-
peror, his treatise on amalgamation; and in the following year, a farther account of it was published by his friend Fer-
ber. As a considerableaving in wood, time, and labour, attended his proc-
s, the emperor gave orders that it should be em-
ployed in the Hungarian mines; and as a recompense to the inventor, a third of the profit that should be gained by adopting his method was granted to him for ten years, and for ten years more the interest of that sum. Such, however, was the hospitality of Born, and his readiness to admit and entertain all travellers, and to patronize diffident talents of every kind, that his expenses exceeded his income, and he was at last reduced to a state of infolvency. Amidst all his bodily infirmities and pecuniary embarrassments, and not-
withstanding the variety of his official avocations, he was in-
defatigable in his literary pursuits; and in 1790, he pub-
lished in two volumes, a "Catalogue methodicae rafonem," of Mifs Raub's collection of toffils, which is regarded as a clas-
ical work on that subject. He employed himself also in bleaching wax by a new chemical process, and in boiling salt with half the wood commonly ufed for that purpose. Whilst he was engaged in writing the "Faft Leopoldina," or a history of the reign of Leopold II, in classical Latin, and a work on mineralogy, his diseafes rapidly advanced, and being attended with violent pafms, terminated his life on the 28th of Augulf, 1791. Townforn's Travels in Hungary, 4to. 1796.

BORN, in Geography, a town of France, in the depart-
ment of the Lot and Garonne, and chief place of a canton, in the district of Villeneuve d'Agen; 13 leagues N.W. of Montfaucon.

BORKA, a town of Germany, in the circle of Upper Saxony, and territory of Leipic, leated on an iland formed by the rivers Wicuri and Pleis. The inhabitants are chiefly employed in manufacturing stuffs; 12 miles S.E. of Leipic.

BORNE, a river of England, which runs into the Tame, about a mile S.W. of Tamworth. - Also, a river of Savoy, which runs into the Arve, about two miles north from Bon-
reville.

BORNEO, an iland of the East Indies, which, before
the discovery of New Holland, was considered as the largest
iland in the world. This iland seems to have been the
Greater Java of Marco Paulo, which, he says, is about 3000
miles in circuit, being above 900 miles in length by 600 at
its greatest breadth. The latest and best account that has
yet been given of this iland is published in the Transactions
of the Batawan Society. The iland of Borneo extends from
the 4th degree of S. lat. to the 8th of N. lat. and from 109°
in length, and 720 in breadth. Its climate is almost the same as that of Java;
but Borneo is lefs mountainous, and the land, for 12 or 15
miles, and sometimes more, from the coast, is almost
every where marshy, and covered with forests of trees of
large fize, and of various kinds. The remaining part of
the iland is sufficiently fertile, and would be productive, if
the inhabitants were not too indolent to cultivate the soil,
and fonder of searching for gold and diamonds, which they
barter with the Javanele for various necellaries of life. The
middle of the iland is occupied by an extensive ridge of
mountains, called the "Crytal mountains," because a great
quantity of crytal is found in them. At the foot of these
mountains is a large iland lake, which is the source of all
the rivers that traverse the whole iland. The real natives
of this iland are the Bidjous, or Biajoos, or Dajakkee,
who live in the interior parts of the country. The sea-coafl
is inhabited by Malays, Moores, Macafers from Celebes, and
Javanele. We have accounts, on which we may depend,
only of the countries fronted along the coal; the interior
parts of the iland being little known. The largel kingdom
in the iland, and the most important on account of its con-
nection with the Dutch East India company, is that of Baj-
jermafling on the southerm coal. The great river Pontiana,
which is navigable for ships that draw from 12 to 13 feet of
water, is very convenient for trade. The fultan Sulthunan
Natalaham, since the year 1771, has transferred his residence
from Cagn-Tangie to Martapura, where he caused a large
city to be built, and a canal to be dug, which pafes through
the middle of it, and at the fame time he changed the name
Martapura into Dumie-Kintjana. The inhabitants of the
city, as well as those who relieve at places in a distance
from the coal, are Mahometans, mixed with a great many Bid-
joos, or Dajakkee, who are Pagans. These Bidjoos,
who inhabit villages, amounting in number to 784, are sub-
ject to various petty princes, who acknowledge the fultan
as their superior. The factory of the Dutch East India
company is situated at the end of the village of Tatas, or
Banjermafling. Their fort is of an octagonal form, sur-
rounded by palisades, which on the east side next the river
is furnished with three, and on the west, or land side, with
two ballions. The productions of the country, which are
fought for as articles of commerce, are pepper, gold (chiefly
gold-dul, not very abundant in metal), diamonds, cane,
birds-neils, wax, pedra del porco, dragon's blood, and iron.
For the Dutch give in exchange agates of a longish
form, rings of red agate, different kinds of coral, all sorts
of Chinese articles, fuch as coarse porcelain, red and other
kinds of silk, all sorts of cotton cloth, fuch as is worn by
the Indians, and the productions of Java, and also gunpow-
der, which, being prohibited by the fultan, is privately intro-
duced. See BANJERMAFLING.

Sucentana lies in 0° 50' S. lat.; and a little north of it is
the river Pontiana, which discharges itself into the sea under
the line, through a great many mouths. At its mouth it is
12 feet in depth, and at high water 16, so that fhips and
small vessels can proceed with great ease in about 12 hours
to the company's factory. The river, at the dilance of
about seven or eight miles from its mouth, separates into
two branches; the southernmost of which flows through the country governed by Pangarang (a term of dignity) Jofep, who, in 1779, was advanced by the company, to be Sultan of Safango and Pontiana, under the name of Sarief Abdulla Rachman. These two kingdoms extend far into the country; and produce excellent gold, wax, birds-nests, pearls, fago, diamonds, tin, and iron, which are bartered for provisions of all kinds and cotton cloth, but particularly rice and salt. Heavy rains prevail here from November till May; and the thermometer is never lower than 82°, nor higher than 94°.

Landac lies on the northern arm of the river Pontiana, in N. lat. 0° 35'. The Dutch had a resident here 150 years ago. After that period their possessions were destroyed, till the king of Bantam, to whom Landac and Succiata had for many years belonged, made a grant, either voluntary or by compulsion, to the company of all the lands in 1778. From this time the Dutch have considered these lands as their property, and the princes who govern them as their vassals; they then built a fort at Pontiana, between Landac and Succiata, and appointed Pangarang Saidja Nata, as regent of the whole district. The residence of the prince of Landac is situated on the projecting point of a mountain, to which there is an ascent by 115 steps. Two rivers, which are so full of rocks that no vessels can be navigated in them, flow on the right and left of this mountain; and the place is naturally impregnable. It is also well garnished with artillery. In this kingdom there are gold and diamond mines of considerable importance.

Between Landac and Borneo, the most northern kingdom of the island, and from which, probably, the whole country took its name, there are several smaller kingdoms, not yet sufficiently known. Their regents are, in part, vassals of the sultan of Borneo. A small trade is carried on in these districts with gold, diamonds, canes, wax, and other articles of the like kind, which are given in exchange for the productions of Java; but the traffic is unimportant and precarious, as the princes of this part of the country live by piracy.

Borneo is governed by a sultan, who resides in this place, where a considerable trade is carried on with the productions of the country, which are pearls, birds-nests, wax, flaves, rice, and camphor. The camphor of this island is preferred even to that of Sumatra. The camphor of Borneo and Sumatra is produced by a tree with oval, sharp-pointed leaves, and large tulip-like flowers. It is thus distinguishable both from the camphor-tree of Japan, and from the other species of the laurel. An hundred weight of the camphor of Borneo costs 3000, and one of that of Sumatra 2000 rix-dollars, but the Japanese costs scarcely 50. Of the camphor of Borneo about 4375 pounds are annually exported. The articles imported are tin, cotton-cloth, and all the productions of Java, except rice, which is cultivated here in great abundance.

The Sultan of Borneo lives in great state, and is more feared by his subjects than that of Banjer; but he is said, by those who frequent this part of the coast in small vessels to exchange cotton-cloth for pepper, to be more content in his friendship, and more faithful in fulfilling his engagements.

Between Borneo and Tidor lie the two small kingdoms of Balangan and Baranoo, where birds-nests, wax, &c. are exchanged for Japanese productions, and a fort of coarse cotton-cloth. Next to these is Danmar, and a little farther are Simnunta, and Cotte. Between the two last are many villages, the names of which are not known. The same articles are exported and imported here as at Borneo.

The next place is Appar Karrang, and the last kingdom is Pusifer. The articles of trade in this country are gold, birds-nests, wax, and canes, which are exchanged for the productions of Java. The inhabitants of Pusifer are few in number, and therefore they have been unable to expel the Bugineese, who have made themselves masters of the river, and also of the trade. Further south lies Simpanan; and the whole country from this place to the extreme boundaries of Salutang belongs to the king of Banjer-malling, who possesses also the great and small island Pah-Lauts. There appear to be no other kingdoms in the interior part of Borneo; or, at least, they are not known. The inhabitants of the mountains bring the productions of their lands, and their different articles of manufacture, to the nearest part of the coast for sale.

The most productive diamond mines of Borneo are at Ambawang, beyond Mohucco, in the district of Banjer-malling, and at Landac and Pontiana. Besides these mines, which lie among the mountains, diamonds are also searched for on the banks of various rivers; but they are so scarce that ten or twelve persons may dig and search sometimes for a whole month before they find diamonds to the value of 20 Spanish rials. With regard to the gold mines, the ignorance of the natives as to everything relative to mining is such, that little advantage is derived from them, though they are supposed to be very rich. In Banjer-malling the gold is found at the depth of about three fathoms; the veins properly so called are of a reddish kind of mud. At Landac the ore is found at the depth of about ten feet, under a crust resembling rotten wood. Of the animals of Borneo the most remarkable is the orang outang.

The Biadoos or Dajakkese, who are the native inhabitants of this island, and principally occupy an extensive district in the interior part of the country on the west side of the river Banjer, are of large stature, and well formed, and their women, whom they never bring to the places of trade, are said to be fair and handsome. In their dresses they resemble the Malys. The women, and even the wives of their princes, are naked to the middle, and generally wear round the body only a short gown. The men paint their bodies with various kinds of figures. They come to Banjer to sell their gold, canes, and rice, for which they receive in exchange coarse Chinese porcelain, copper, and earthen vessels or tappanyangs, on which are represented dragons, snakes, and other figures suited to their taste. Before any one of the Biadoos can succeed in obtaining a female for his wife, he must give proof of his courage by cutting off the head of an enemy; and when he is accepted by the parents, he carries to his bride a present, which consists of a male or female slave, two dresses, and a water-pot, on which some of their favourite figures are exhibited. On the wedding day, the bride and bridgroom give each a feast at their respective houses; at the conclusion of which, the bridegroom, in his best apparel, is conducted to the residence of the bride, at whose door is one of her relations, who finesses him with the blood of a cock, which has been killed for that purpose; and the bride is fined in like manner with the blood of a hen. They then present to each other their bloody hands, and the solemnity is closed with a feast. If the wife die, the husband cannot contract a second marriage until he has cut off the head of some individual of another nation, and thus avenged the death of his wife. When a married woman commits adultery, the husband, without avenging himself on the adulterer, puts to death two or three of his slaves, and thus frees himself from all shame; the woman is punished merely with words, but sometimes with blows. The Biadoos are unacquainted with polygamy.
polygamy. If a man willies to separate from his wife in consequence of her having committed some crime, he retains her clothes and ornaments, and makes her pay a fine amounting to about 20 gold-ricks; and each party is then at liberty to marry. When a Bajjajo dies, the body is put into a coffin, and kept in the house, until all the remaining males in the family have purchased a slave; who is beheaded on the day when the body is burnt, that he may attend the decent in the other world; and before he is put to death, he is enjoined fidelity to his master. The ashes of the deceased, together with the head of the slave, are put into a watering-pot, and deposited in a small edifice or tomb constructed for that purpose. Sometimes a whole year elapses before a slave can be procured. The houses of the Bajjajos are constructed of boards joined together without windows or partitions, except that which separates a small corner in which they sleep. The whole family reside together with their slaves, and confit sometimes of 100 persons. Their only light is that of a piece of pine-wood, which burns no longer than till about eight in the evening. Over their doors they suspend the bloody heads which they cut off in their skirmishes. In order to procure these they proceed, with great secrecy, to the river Banjer, and surprise in the night, or attack, in open day, some small vessel belonging to Banjer fishermen; and one or two of their unfortunate captives are then destined to become a sacrifice to their insatiable rage for murder. When they return with a head, the men, women, and children of a whole village tellify their satisfaction by every demonstration of joy. Gongs, or musical instruments of copper, are beat by those who conduct the conqueror to his own house, where the women dance around him, and taking from him the head, they force into the mouth some food and drink; after which ceremony, accompanied with a repast and dance, they hang it up as a trophy of victory. Before the Bajjajos undertake expeditions in quest of Banjerefe heads, they endeavour to deduce some omen of good or bad fortune from the flight of a kind of hawk (Falco milvus). They have a scarcely any form of government, and no written laws. If a person be accused of theft, and no sufficient proof can be alleged against him, the culprit and the accuser are carried before one of the oldest inhabitants. An earthen pot with ashes and water is placed on the ground; and across the pot is laid a piece of wood, upon which are deposited two small copper buttons. An oath having been administered to each party, the piece of wood is so turned round that the buttons fall into the water; the accused and the accuser take up one of these buttons; and he, whole button appears as if scooped and whitened by the ashes, is deemed to have succeeded. The Bajjajos are said to have some idea of a supreme being, to whom they address prayers under the name of Dewatta; and as they believe that this Dewatta not only created, but still preserves and rules the world, they request him to grant them happiness and prosperity. If we may judge from the character of these people, their deity must be a gloomy and revengeful being; no nation on earth having a greater propensity to murder and revenge. The Bajjajos acknowledge the sultan of Banjer as their sovereign, and pay him yearly a small tribute in gold dust of the value of 20 rials. The Portuguese, Dutch, and English have ever since the 16th century endeavoured to establish themselves in this island; but the Dutch have been the most successful. The Portuguese, it is said, wished to form a settlement here in 1526, and with this view presented to the sultan of Landac and Succatana some beautiful pieces of tapestry, on which curious figures were wrought; but the sultan, conceiving these figures to be animated or magick, and apprehending that they might rush suddenly from the tapestry and strangle him, rejected the present and expelled the Portuguese from the country. The English were not much more fortunate, having quitted Borneo entirely ever since the year 1766. In 1769, they made an attack to form a settlement in the island of Balambanga, at the N. extremity of Borneo, which was given up to them by the king of Solon. They placed in it a few Europeans for the sake of trade, and a garrison of 200 soldiers, Europeans and blacks; and intended to establish a factory, where they might exchange the productions of Europe and Hindostan for those brought hither from China and the Indian islands; but in the year 1772, after a part of their troops had been swept off by contagious diseases, the fort they had constructed, being badly fortified, was suddenly attacked, and the whole establishment destroyed. The English have still some establishments on the north coast of Borneo; and the circular Indian nations, and the Chinees carry on a great trade with this island. About Borneo are several small islands, that may be denominated the "Bornean islands," such as the Soloos, Tauve, Pulo Laut, Anamba, Natuna, &c. BORNEO, a fen-port and capital of the island of this name, is large, populous, and commercial, with a good harbour; it consists of about 300 houses, built on piles, and is situated on the N. W. side of the island. N. lat. 4° 30'. E. long. 115° 6'. BORNEVALT, a town of Germany, in the circle of Wefphalia, and duchy of Berg; 3 miles W. of Lempen. BORNEUS, in Ornithology, the long-tailed scarlet lory. This beautiful bird is of a red colour; quills and tail feathers at the tips green; a blue spot on the wings; orbits fuscous. Inhabits India. The length of this bird is nine inches and a half. Its bill is orange; orbits of the eyes bare of feathers; quill feathers with blue and green dots; the two exterior feathers inclining to green; lower tail covert red, bordered with blue. Gmel.—Lori peruvius rubra, No. I. Buff. Psittaca eucincus bonarum fortunaris infals. Briff. BORNEHEIM, a village of Germany, in the circle of the Upper Rhine, and territory of Franckfort on the Main; 10 English miles N. of Franckfort. This village is said to be notorious all over Germany for its numerous brothels. Tender's Tour. BORNHOLM, an island of Denmark, in the Baltic sea, the remotest and most easterly of all the Danish islands, about 18 miles in length, and 10 in breadth. Although it is nearly surrounded by rocks, and the soil is floucy, it is a fertile spot, abounding with excellent pastures; oats, butter, and flax constitute the wealth of the inhabitants. There are some mines of coal and quarries of marble. It was conquered by the Swedes in 1645, and surrendered to them by the treaty of Roskild, in 1658; but the inhabitants revolted in the same year, and restored their island to the Danish dominion, under which it has since continued. Bornholm is distant 75 miles from Zealand, and 15 from the coast of Schonen. N. lat. 50° 12'. E. long. 15° 20'. BORNII, in Conchology, a species of Tellina, figured by Born. This shell is transfusely tinted, bent on one side, and reddish, with red rays. This is three quarters of an inch long, and two inches broad. The native place is not known. BORNOU, in Geography, an extensive kingdom of Africa, lying south-east of Fezzan, and bounded on the north by the desert of Bilma, on the west by Kuka, Tagua, and Nubia.
Nubia, on the south by Kaua and Begamenc, and on the west by Zegzeg, Zanfara, and Kaffina. The name Bor-nou, which is given to this kingdom by the natives, is distinguished in Arabia by the appellation of Bornon, or Bornou, signifying the land of Noah; for the Arabs conceive, that, on the first retiring of the deluge, its mountains received the ark. This is a country of great extent, being comprehended between the 16th and about the 22d degrees of N. latitude. The climate is characterized by excessive, but not uniform, heat. Two feasons divide the year; one commencing about the middle of April, and introduced by violent winds from the S. E. and S., intense heat, a deluge of rain, and such temp'ls of thunder and lightning as destroy many cattle and people; at this time the inhabitants confine themselves to their houfes; the rest of the feason, though sultry and rainy, does not hinder the labours of the husbandman and hfepherd. The other feason commences towards the latter end of October, when the heat becomes less intense, the air more cool and mild, and the weather fere. The inhabitants are numerous, and confift of various nations; and it is reported that thirty different languages are spoken in this empire. The language of the common people of Bornou, though different from, strongly resembles that of the neighbouring negroes, and is very unlike the Arabic, in which, however, the nobles and principal families converse. The art of writing is known among them; and they are taught to express the Bornou tongue in the characters of the Arabic. They are entirely black, but not of the negro call. Their general drefs is composed of shicts of blue cotton, manufactured in the country; a red cap, imported from Tripoli; and a white muffin turban, brought from Cairo by the pilgrims, who return through that city from Mecca. Nofe-rings of gold are also worn by the principal people, as a mark of distinction. Wheat and barley are feldom raised in Bornou; but the horse-bean of Europe, and the common kidney-bean are affiduously cultivated, as they are used for food, both by the females and by the cattle. They affo cultivate a kind of grain peculiar to the country; and the neighbour-hood of the city of Bornou is fettle in Indian corn and rice. Gum-trees are thinly scattered; cotton, hemp, and indigo are also to be reckoned among the various productions of its soil. In the culture of the ground, the hoe is the only instrument in use, as the plough is not known; and the f-men share with the men the labours of their husbands. The sowing feason commences at the end of the periodical rains in April; and fuch is the rapidity of vegetation, that one species of their grain is reaped in July, and another, of slower growth, in August or September. Two species of roots are used as subftral and wholesome food; one called the “doudoo,” whose leaves resemble those of the garden bean, is dried in the sun, and reduced to fine powder, which is mixed with palm oil into the confiftency of pate; and the other prepared for use merely by boiling. The fruits of Bornou are grapes, apricots, pomegranates, lemons, limes, and melons. The dates are scarce and indifferent, as are also the apples and plums; but it has a valuable vegetable, called “Kedeyah,” refembling the olive in form and height, and the lemon in its leaf, which bears a nut, whose kernel is an esteemed fruit, and felle, when bruised, yields an oil that supplies the lamps with a substitute for the oil of olives. To the caves of animals we may refer innumerable flocks of sheep, and herds of goats and cows, (for there are no oxen,) together with multitudes of hores, buffaloes, and camels, the flete of which is in high estimation, which cover the vales or paitures on the mountains of Bornou. The common fowl is reared by the inhabitants; and their hives of bees are fo numerous, that the wax is often thrown away as an article of no value in the market. Their game consists of antelopes, partridges, wild ducks, and the oilrich, the flesh of which they prize above every other. Their other wild animals are the lion, the leopards, the civet-cat, the small wolf, the fox, the wild dog that hunts the antelopes, the elephant, of which, however, they make no use, the crocodile, the hippopotamus, and giraffe. Bornou is much infected with different kinds of dangerous and disgusting reptiles, especially snakes and scorpions, centipedes and toads. Its bands of burthen are numerous and various; of which we may reckon the camel, the hore, the asl, and the mulle. The dog appears to be the only domestic animal. In Bornou the fame plan of constructing their houfes universally prevails. Four walls, including a square, are erected; within the walls, and parallel to them, four other walls are also built; the ground within the walls then divided into different apartments, and covered with a roof. Thus the space within the interior walls determines the size of the court; the space between the walls, limits the width of the apartments; and the height of the walls regulates the height of the rooms. In a large houfe the rooms are each about twenty feet long, eleven feet high, and as many in width. On the outside of the houfe, a second square or large yard, surrounded by a wall, is usually provided for the inclosure and protection of the cattle. The walls are generally composed of earth and sand, but others are formed of stones or bricks and clay; and the roofs of branches of the palm-tree, intermixed with brushwood, covered with layers of earth; and the whole building is white-washed with a species of chalk. The utensils of a houfe, among the lower claffes, are matts covered with a sheepskin, upon which they sleep; an earthen pot and pan; two or three wooden dishes, a couple of wooden bowls, an old carpet, a lamp for oil, and a copper kettle. Perfons of a superior rank also poifeft more numerous and various capabillofs, fluffed with wool, brass, and copper utensils, a handsome carpet, and a sort of candlestick, which is used for their candles that are made of their bees' wax and the tallow of their sheep. The current species of the empire consists of pieces of metal from an ounce to a pound in weight, formed of copper and brass, melted together and mixed with other materials. The ruling people in Bornou profess the mahometan religion, so that the sultan and his subjects are muflims, and the other claffes are pagans. The government is an elective monarchy; and the new sovereign, when chosen from among the sons of his predecessor, is invested with all the powers, and with two-thirds of all the court and land, of his father; the remaining third being always de- signed as a provision for the other children of the deceased monarch. To the four lawful wives of the late sovereign, a separate houfe with a suitable establishment, is granted by the reigning monarch; and such of his concubines, as were not slaves, are at liberty to return to their friends, with their clothes and ornaments, and with the permission to marry. The administration of the provinces of Bornou is committed to governors, appointed by the crown; and the expenses of the sovereign are defrayed partly by his hereditary lands, and partly by taxes levied on the people. The sultan Alli, who was the sovereign of Bornou, in 1789, though plain in his drefs, maintained a magnificent seraglio, accommodating 500 ladies, and was reputed to be the father of 350 children; and the number of horses kept for his own use and that of his servants, amounted to 500. The military force of Bornou consists in a great multitude of horemen, which renders him a much more powerful monarch than the emperor of Morocco; but his foot-soldiers are few in number, and of little importance. Their weapons of offence are the fabrics, the lance, the pike, and the bow; and a shield of hides forms their
polygamy. If a man wishes to separate from his wife in consequence of her having committed some crime, he retakes her clothes and ornaments, and makes her pay a fine amounting to about 30 rials; and each party is then at liberty to marry. When a Biradjoo dies, the body is put into a coffin, and kept in the house, until all the remaining males in the family have purchased a grave, who is buried on the day when the body is burnt, that he may attend the decease in the other world; and before he is put to death, he is enjoined fidelity to his master. The ashes of the deceased, together with the head of the grave, are put into a watering-pot, and deposited in a small edifice or tomb constructed for that purpose. Sometimes a whole year elapses before a slave can be procured. The houses of the Biradjoes are constructed of boards joined together without windows or partitions, except that which separates a small corner in which they sleep. The whole family reside together with their slaves, and confide sometimes of 50 persons. Their only light is that of a piece of pine-wood, which burns no longer than till about eight in the evening. Over their doors they suspend the bloody heads which they cut off in their skirmishes. In order to procure these they proceed, with great fecracy, to the river Banjer, and surplice in the night, or attack, in open day, some small vessel belonging to Banjer fishermen; and one or two of their unfortunate captives are then defined to become a sacrifice to their inimitable rage for murder. When they return with a head, the men, women, and children of a whole village tellify their satisfaction by every demonstration of joy. Gongs, or musical instruments of copper, are beat by those who conduct the conqueror to his own house, where the women dance around him, and taking from him the head, they force into the mouth some food and drink; after which ceremony, accompanied with a repast and dance, they hang it up as a trophy of victory. Before the Biradjoes undertake expeditions in quest of Banjerese heads, they endeavour to deduce some notion of good or bad fortune from the flight of a kind of hawk (Falco milvus). They have fearlessly any form of government, and no written laws. If a person be accused of theft, and no sufficient proof can be alleged against him, the culprit and the accuser are carried before one of the eldest inhabitants. An earthy pot with ashes and water is placed on the ground; and across the pot is laid a piece of wood, on which are deposited two small copper buttons. An officer, having been administered to each party, the piece of wood is so turned round that the buttons fall into the water; the accuser and the accuser take up one of these buttons; and he, whose button appears as if sovered and whitened by the ashes, is deemed to have succeeded. The Biradjoes are said to have some idea of a supreme being, to whom they address prayers under the name of D.watta; and as they believe that this Dewatta not only created, but still preserves and rules the world, they require them to grant them happiness and prosperity. If we may judge from the character of these people, their deity must be a gloomy and revengeful being; no nation on earth having a greater propensity to murder and revenge. The Biradjoes acknowledge the sultan of Banjer as their sovereign, and pay him yearly a small tribute in gold dust of the value of 20 rials.

The Portuguese, Dutch, and English have ever since the 16th century endeavoured to establish themselves in this island; but the Dutch have been the most successful. The Portuguese, it is said, wished to form a settlement here in 1564, and with this view presented to the sultan of Landac and Succatana some beautiful pieces of tapestry, on which curious figures were wrought; but the sultan, conceiving these figures to be animated or magic, and apprehending that they might rush suddenly from the tapestry and strangle him, rejected the present and expelled the Portuguese from the country. The English were not much more fortunate, having quitted Borneo entirely ever since the year 1706. In 1766, they made an attempt to form a settlement in the island of Balambangan, at the N. extremity of Borneo, which was given up to them by the king of Solon. They placed in it a few Europeans for the like of trade, and a garrison of 500 soldiers, Europeans and blacks; and intended to establish a factory, where they might exchange the productions of Europe and Hindostan for those brought hither from China and the Indian isles; but in the year 1772, after a part of their troops had been swept off by contagious diseases, the fort they had constructed, being badly fortified, was suddenly attacked, and the whole establishment destroyed. The English have built some establishments on the north coast of Borneo; and the circumjacent Indian nations, and the Chinese carry on a great trade with this island. About Borneo are several small isles, that may be denominated the "Bornean islands," such as the Solos, Tawea, Pulo Laut, Anamba, Natura, &c.

**Borneo.** The sea-port and capital of the island of this name, is large, populous, and commercial, with a good harbour; it contains about 350 houses, built on piles, and is situated on the N. W. side of the island. N. lat. 4° 30'. E. long. 115° 0'.

**Bornevalt.** A town of Germany, in the circle of Wellphalia, and duchy of Berg; 3 miles W. of Lemnep.

**Borneus.** In Ornithology, the long-tailed facettes lory. This beautiful bird is of a red colour; quills and tail feathers at the tips green; a blue spot on the wings; orbits fuscous. Inhabit India.

The length of this bird is nine inches and a half. Its bill is orange; orbits of the eyes bare of feathers; quill feathers with blue and green dots; the two exterior feathers inclining to green; lower tail coverts red, bordered with blue. Gmel.—Lori peruvius rossus, No. 1. Duff. Ptilina eversa bonare bonarum fortunarium infula. Driff.

**Borneheim.** A village of Germany, in the circle of the Upper Rhine, and territory of Frankfort on the Mayne; 6 English miles N. of Frankfort. This village is said to be notorious all over Germany for its numerous brothels.

**Rendier's tour.**

**Borholm.** An island of Denmark, in the Baltic sea, the remotest and most easterly of all the Danish islands, about 18 miles in length, and 10 in breadth. Although it is nearly surrounded by rocks, and the soil is rocky, it is a fertile spot, abounding with excellent pastures; oats, butter, and fish constitute the wealth of the inhabitants. There are some mines of coal and quarries of marble. It was conquered by the Swedes in 1645, and surrendered to them by the treaty of Roldik, in 1658; but the inhabitants revolted in the same year, and restored their island to the Danin dominion, under which it has since continued. Borholm is distant 75 miles from Zeland, and 14 from the coast of Schonen. N. lat. 55° 1' 12'. E. long. 15° 20'.

**Borin.** In Conchology, a species of Tellina, figured by Born. This shell is transversely flinted, bent on one side, and reddish, with red rays. This is three quarters of an inch long, and two inches broad. The native place is not known.

**Borne, in Geography, an extensive kingdom of Africa, lying south-east of Egypt, and bounded on the north by the desert of Bilma, on the west by Kuka, Tagua, and Nubia,
Nabia, on the south by Kanga and Begamme, and on the west by Zegrez, Zanfara, and Kasfina. The name Bornou, which is given to this kingdom by the natives, is distinguished in Arabia by the appellation of Béron, or Berou, signifying the land of Noah; for the Arabs conceive, that, on the first retiring of the deluge, its mountains received the ark. This is a country of great extent, being comprehended between the 10th and about the 22d degrees of N. latitude. The climate is characterized by excessive, but not uniform, heat. Two seasons divide the year; one commencing about the middle of April, and introduced by violent winds from the S.E. and S., intense heat, a deluge of rain, and such tempests of thunder and lightning as destroy many cattle and people; at this time the inhabitants confine themselves to their houses; the rest of the season, though sultry and rainy, does not hinder the labours of the husbandman and shepherd. The other season commences towards the latter end of October, when the heat becomes less intense, the air more soft and mild, and the weather serene. The inhabitants are numerous, and consist of various nations; and it is reported that thirty different languages are spoken in this empire. The language of the common people of Bornou, though different from, strongly resembles that of the neighbouring negroes, and is very unlike the Arabic, in which, however, the nobles and principal families converse. The art of writing is known among them; and they are taught to express the Bornou tongue in the characters of the Arabic. They are entirely black, but not of the negro cast. Their general dress is composed of shirts of blue cotton, manufactured in the country; a red cap, imported from Tripoli; and a white mufflin turban, brought from Cairo by the pilgrims, who return through that city from Mecca. Noe-rings of gold are also worn by the principal people, as a mark of distinction. Wheat and barley are seldom raised in Bornou; but the horse-bean of Europe, and the common kidney-bean are affluently cultivated, as they are useful for food, both by the slaves and by the cattle. They also cultivate a kind of grain peculiar to the country; and the neighbourhood of the city of Bornou is fertile in Indian corn and rice. Gum-trees are thinly scattered; cotton, hemp, and indigo are also to be reckoned among the various productions of its soil. In the culture of the ground, the hoe is the only instrument in use, as the plough is not known; and the women share with the men the labours of their husbandry. The sowing season commences at the end of the periodical rains in April; and such is the rapidity of vegetation, that one flower growth, in August or September. Two species of roots are used as subsistence and wholesome food; one called the "dondoo," whose leaves resemble those of the garden bean, is dried in the sun, and reduced to fine powder, which is mixed with palm oil into the consistency of paste; and the other prepared for use merely by boiling. The fruits of Bornou are grapes, apricots, pomegranates, lemons, limes, and melons. The dates are scarce and indifferent, as are also the apples and plums; but it has a valuable vegetable, called "Kédénah," resembling the olive in form and height, and the lemon in its leaf, which bears a nut, whose kernel is an esteemed fruit, and seed; when bruised, yields an oil that supplants the lamps with a substitute for the oil of olives. To the class of animals we may refer innumerable flocks of sheep, and herds of goats and cows, (for there are no oxen,) together with multitudes of horses, buffaloes, and camels, the flesh of which is in high estimation, which cover the vales or pastures on the mountains of Bornou. The common fowl is reared by the inhabitants; and their hives of bees are so numerous, that the wax is often thrown away as an article of no value in the market. Their game consists of antelopes, partridges, wild ducks, and the gallin, the flesh of which they prize above every other. Their other wild animals are the lion, the leopards, the cheetah, the small wolf, the fox, the wild dog that hunts the antelope, the elephant, of which, however, they make no use, the crocodile, the hippopotamus, and giraffe. Bornou is much infested with different kinds of dangerous and disgusting reptiles, especially snakes and scorpions, centipedes and toads. Its baths of brine are numerous and various; of which we may reckon the camel, the horse, the ass, and the mule. The dog appears to be the only domestic animal. In Bornou the fame plan of constructing their houses universally prevails. Four walls, including a square, are erected; within the walls, and parallel to them, four other walls are also built; the ground between the walls is then divided into different apartments, and covered with a roof. Thus the space within the interior walls determines the size of the court; the space between the walls, limits the width of the apartments; and the height of the walls regulates the height of the rooms. In a large house the rooms are each about twenty feet long, eleven feet high, and as many in width. On the outside of the house, a second square or large yard, surrounded by a wall, is usually provided for the inclosure and protection of the cattle. The walls are generally composed of earth and sand, but others are formed of stones or bricks and clay; and the roofs consist of branches of the palm-tree, intermixed with brushwood, covered with layers of earth; and the whole building is white-washed with a species of chalk. The utensils of a house, among the lower classes, are mats covered with a sheepskin, upon which they sleep; an earthen pot and pan; two or three wooden dishes, a couple of wooden bowls, an old carpet, a lamp for oil, and a copper kettle. Perfumes of a superior rank also pollute leather cushions, stuffed with wool, brads and copper utensils, a handkerchief, a carpet, and a sort of candlestick, which is used for their candles that are made of their bees' wax and the tallow of their fleece. The current species of the empire consists of pieces of metal from an ounce to a pound in weight, formed of copper and brass, melted together and mixed with other materials. The ruling people in Bornou profess the mahometan religion, so that the sultan and his subjects are Mussulmen, and the other classes are pagans. The government is an elective monarchy; and the new sovereign, when chosen from among the sons of his predecessor, is invested with all the laws, and with two-thirds of all the cattle and land, of his father; the remaining third being always detained as a provision for the other children of the deposed monarch. To the four lawful wives of the late sovereign, a separate house with a suitable establishment, is granted by the reigning monarch; and such of his concubines, as were not slaves, are at liberty to return to their friends, with their cloaths and ornaments, and with the permission to marry. The administration of the provinces of Bornou is committed to governors, appointed by the crown; and the expenses of the sovereign are defrayed partly by his hereditary lands, and partly by taxes levied on the people. The sultan Ali, who was the sovereign of Bornou, in 1789, though plain in his dress, maintained a magnificent retinue, accommodating 500 ladies, and was reputed to be the father of 350 children; and the number of horses kept for his own use and that of his servants, amounted to 500. The military force of Bornou consists in a great multitude of horsemen, which renders him a much more powerful monarch than the emperor of Morocco; but his foot-soldiers are few in number, and of little importance. Their weapons of offence are the sabre, the lance, the pike, and the bow; and a shield of hides forms their
their defensive armour. Fire-arms, though not entirely unknown, are neither used nor possessed by the people of Bornou. As to their habits and manners, the people are regularly courteous and humane. On the road they stop to salute every one they meet; their quarrels, when they occur, are mere contes of words; and though their women share with them in the burdens of husbandry, their work, which is dropping the rice in the furrows, and removing the weeds with a hoe, is more an amusement than labour. Their attachment to play is immediate; and on the game of drafts, which is the only game with which the lower classes are acquainted, they stake their gold dust, their brass money, and even their claptas. Persons of a superior rank are equally devoted to chess, in which they are eminently skilful. The articles of export furnished by the empire of Bornou are gold-dust, slaves, produced from Begarmie, horses, ostrich feathers, salt, collected on the shores of the several lakes that produce it, and caviare, obtained from a species of wild cat that is common in the woods of Bornou and Kaffina. As to their manufactures, they make a coarse linen of the hemp of their country. Their cotton is spun to a very fine thread, and then manufactured into calicoes and muslins about nine inches broad, and in length from fifteen to twenty yards. Such of these cotton manufactures as are enriched with the blue dye of the country, which, from the superindority of the indigo, is preferable to that of the East Indies, are valued more highly than silk. They also fabricate a species of carpet, as a covering for their horses; and tents, of wood and the hair of goats and camels, are made for the use of the army. From the iron ore of their country they form, with little skill, such forges tools as their husbandry requires; and the little silver they have is converted by their own artillers into rings. In return for their exports, they receive from Tripoli, by way of Fezzan, copper and brass, which are used as current speces; and also imperial dollars, of which they make rings and bracelets for their women; red woven caps worn under the turban, check linens, light coarse woollen cloths, baize, baracans, small Turkey carpets, and plain Mefurata carpets. Mr. Lucas's Communications in the Proceedings of the African Association.

Bornou, the capital of the country above-described, is situated at the distance of a day's journey from a river which is called "Wed-el-Gazel," from the multitude of antelopes that feed on its banks, and which is lost in the deep and sandy wastes of the very deserts of Djama. It is seated in a flat country, on the banks of a small river. Bornou, though a town of greater extent than Tripoli, consists of a multitude of hovels, so irregularly placed, that the intervals between them cannot be called streets; it is furnished with mosques, which are constructed of brick and earth, and with schools, in which the Koran is taught, as in the principal towns of Barbary. The royal palace, in which the sultan resides in time of peace, is surrounded by high walls, and forming a kind of citadel, is built, perhaps for security, in a corner of the town. Within the city are markets for the sale of provisions; but for other articles a weekly market, as in Barbary, is held without the walls. This city is surrounded by a wall, fourteen feet high, constructed on a foundation from eight to ten feet deep, of considerable strength. It is secured by a ditch which encompasses the whole; and at fun set, the seven gates, which form the communication with the country, are shut. Brown, in his travels, p. 167, says, that the wall has four gates, opening east, west, north, and south. N. lat. 19° 35'. E. long. 22° 40'.

Bornstett, a town and bailiwick of Germany, in the circle of Upper Saxon; 4 miles S. W. of Eillben.

Borny, a town of France, in the department of the Marne, and chief place of a canton, in the district of Metz, 2 miles E. of Metz.

Boroczane, a town of Poland, in the patinate of Red Russia; 38 miles S. W. of Haine.

Borolibicus, the wind which blows in the middle between the north and west points; called also the north-west wind.

Borono, in Geography, a town of Russia, in the government of Archangel; 80 miles S. of Archangel.

Boros-Jeno, a town of Hungary; 28 miles S. of Gros-Warden.

Borough, Burrow, Borow, or Burgh, is frequently used for a corporate town, which is not a city.

Borough, in its original Saxon hores, or borh, is by some supposed to have been primarily meant of a tything or company consisting of ten families, who were bound or combined together as each other's pledge.

Afterwards, as Verilignian informs us, borough came to signify a town that had something of a wall or inclosure about it, so that all places which among our ancestors had the denomination of borough, were one way or other fenced or fortified. But in later times, the same appellation was also bestowed on several of the ville insigne, or country towns of more than ordinary note, though not walled. According to Somner, a borough was a place of safety, protection, and privilege; and in the reign of King Henry II. boroughs were so highly privileged that if a bondman or servant remained in a borough a year and a day, he was by such residence made a free-man. Grindal. These were denominated free-burghs, and the tradesmen who inhabited them free-burghese, because they enjoyed a freedom to buy and sell without molestation, and with exemption from toll, &c., granted by charter.

The ancient Saxons, according to Spelman, gave the name burgh to those called, in other countries, cities. But divers canons were made for removing the episcopal fees from villages and small towns to the chief cities, the name city became attributed to episcopal towns, and that of borough retained to all the rest; though none of them had the appearance of cities, as being governed by their mayors, and having laws of their own making, and sending representatives to parliament, and being fortified with a wall and castle, and the like. See City.

Borough, or burgh, is now particularly appropriated to such towns and villages, as send burgesses or representatives to parliament.

Boroughs are equally such, whether they be incorporate or not; there being great numbers of our English boroughs not incorporated; and, on the contrary, several corporations that are not boroughs; e. g. Kingston, Deal, Kendal, &c.

Boroughs are distinguished into those by charter or statute; and those by prescription or custom.

The number of boroughs in England and Wales, including cities and county ports, which elect members, is 215; some whereof send one, some two representatives.

It has been a subject of controversy among antiquaries, at what time the representatives of boroughs formed a part of the great council of the nation. Some have traced their origin as far back as the Saxon Witenagemot; and have supposed that they were the, fidei-, sapientes, or wise men, two, besides the prelates and elders, are mentioned as a component part of this assembly. Others, however, have maintained, that these wise were the judges, or men learned in the law. Others who exclude the burgesses, or commons, from the Saxon witenagemot,
allege, that the expressions, employed by all ancient historians, in mentioning this national council, seem to contradict the former supposition. The members, it is said, are almost always called the princes, barons, magnates, peers; terms which seem to suppose an aristocracy, and to exclude the commons. The boroughs also, from the low state of commerce, were so small and so poor, and the inhabitants lived in such dependence on the great men, that it does not seem probable they would be admitted as a part of the national councils. It appears from Domesday that the greatest boroughs were, at the time of the conquest, scarcely more than country villages; and that the inhabitants of a station little better than servile. If it be unreasonable to think that the valets of a barony, though their tenure was military, and noble, and honourable, were ever fummoned to give their opinion in national counsels, much less can it be supposed, that the tradesmen or inhabitants of boroughs, whose condition was so much inferior, would be admitted to that privilege. These boroughs were not then so much as incorporated; they formed no community; they were not regarded as a body politic; and being merely formed of a number of low dependent tradesmen, living without any particular civil tie, in neighbourhood together, they were incapable of being represented in the states of the kingdom. The commons are well known to have had no share in the governments established by the Franks, Burgundians, and other northern nations; and as the Saxons remained longer barbarous and uncivilized than these tribes, they could never think of conferring such an honourable privilege on trade and industry. The military profection alone was honourable among all those conquerors; the warriors subsisted by their possessions in land; they became considerate by their influence over their valets, retainers, tenants, and slaves; and it requires strong proof to convince us, that they would admit any of a rank so much inferior as theburghers, to share with them in the legislative authority. The first corporation, even in France, which made more early advances in arts and civilization than England, is sixty years posterior to the conquest under the duke of Normandy; and in Normandy, the constitution of which was most likely to be William's model in raising his new fabric of English government, the states were entirely composed of the clergy and nobility; and the first incorporated boroughs, or communities, of that ducy, were Rotten and False, which enjoyed their privileges by a grant of Philip Augustus, in the year 1207. All the ancient English historians, when they mention the great council of the nation, call it an assembly of the baronage, nobility, or great men; and none of their expressions, says Mr. Hume, (ubi infra) though several hundred passages might be produced, can, without the utmost violence, be tortured to a meaning, which will admit the commons to be constituent members of that body. When historians mention the people, populus, as a part of the parliament, they always mean the laity, in opposition to the clergy; and though the word communis sometimes occurs, Mr. Brady maintains, that it always means communis baronii. If, therefore, in the long period of 200 years, which elapsed between the conquest and the latter end of Henry III., and which abounded in factions, revolutions, and convulsions of all kinds, the house of commons never performed one single legislative act, so considerable as to be once mentioned by any of the numerous historians of that age, they must have been totally insignificant; and in that case, what reason can be assigned for their ever being assembled? can it be supposed, that men of so little weight or importance possessed a negative voice against the king and the barons? Every page of the subsequent histories discovers their existence; though these histories are not written with greater accuracy than the preceding ones, and indeed scarcely equal them in that particular. The magna charta of king John provides, that no licence or aid should be imploed, either on the land or towns, but by consent of the great council; and for more security, it enumerates the persons entitled to a seat in that assembly, the prelates and immediate tenants of the crown, without any mention of the commons: "An authority (says Mr. Hume) so full, certain, and explicit, that nothing but the zeal of party could ever have procured credit to any contrary hypothesis." The same writer adds, that it was probably the example of the French barons, which first emboldened the English to require greater independence from their sovereign; and it is also probable, that the boroughs and corporations of England were established in imitation of those of France.

In ancient times, men were not very solicitous to obtain a place in the legislative assemblies; and rather regarded their attendance as a burden, which was not compensated by any return of profit or honour, proportionate to the trouble and expense. The only reason for instituting these public councils was, on the part of the subject, that they defied some security from the attempts of arbitrary power; and on the part of the sovereign, that he desired of governing men of such independent spirits without their own consent and concurrence. But the commons, or the inhabitants of boroughs, had not yet reached such a degree of consideration as to derive security against their prince; or to imagine, that even if they were assembled in a representative body, they had power or rank sufficient to enforce it. For protection against the violence and injustice of their fellow citizens, in which alone they aspired, they directed their views to the courts of justice, or to some great lord, to whom, either by law or by choice, they were attached. On the other hand, the sovereign was sufficiently averse from obligation in the whole community, if he procured the concurrence of the nobles. The military bar-valets could entertain no idea of opposing both their prince and their superiors; and much less could the burghers and tradesmen aspire to such a thought. Thus, if history were silent on the head, there is reason to conclude, from the known situation of society during those ages, that the commons were never admitted as members of the legislative body.

The first time in which, according to the opinion of those who admit the conclusiveness of the above reasoning, historians speak of any representatives sent to parliament by the boroughs, was the year 1265, during the reign of Henry III.; when the earl of Leicester usurped the royal power, and summoned a new parliament to London, where he knew his power was uncontrollable. Besides the barons of his own party, and several ecclesiastics, who were not immediate tenants of the crown, he ordered returns to be made of two knights from each shire, and also of deputies from the boroughs; an order of men, it is said, which, in former ages, had always been regarded as too mean to enjoy a place in the national councils. Accordingly, this period is commonly esteemed the epoch of the house of commons in England. But though that house derived its existence from so precarious, and even so invidious an origin, as Leicester's usurpation, it soon proved, when summoned by the legal princes, one of the most useful, and, in process of time, one of the most powerful members of the national constitution; and gradually reduced the kingdom from aristocratical as well as from regal tyranny. But Leicester's policy, if we ascribe to him so great a blessing, only forewarded by some years an institution, for which the general state of things had already prepared the nation. It was not, however, till the 23d year
year of the reign of Edward I. (A.D. 1274), that the
deputies of towns and boroughs were by a regal
summons, introduced into parliament. This is therefore regarded as the
governmental and true epoch of the house of commons, and the faint
dawn of popular government in England. Leicesters's usurpation
produced only a temporary effect, and the summons of
representatives from boroughs was discontinued in subsequent
parliaments; but from this period burgesses became a perma-
ment part of the British legislature. The necessities of
Edward, occasioned by his continual wars, and by the dimin-
ution of his revenues, induced him to recur to this measure
for obtaining requisite supplies; and he became sensible, that
instead of imposing taxes by his prerogative, and enforcing
his edicts for this purpose, a more expeditious and effectual
means was to assemble the deputies of all the boroughs, to
lay before them the necessities of the state, to discuss the
matter in their presence, and to require their consent to the
demands of their sovereign. With this view he issued
writs to the sheriffs, enjoining them to send to parliament, along
with two knights of the shire, two deputies from each bor-
ough within their county, and these provided with sufficient
powers from their community, to consent in their name, to
what he and his council should require of them. Accord-
ingly, writs were issued to about 120 cities and boroughs.
As it is a most equitable rule, says he in his preamble
to this writ, "that what concerns all should be approved by
all, and common dangers be repelled by united efforts;" a
noble principle, which may seem to indicate, says Mr. Hume,
a liberal mind in the king, and which laid the foundation of
a free and an equitable government. The writs of the parlia-
ment immediately preceding remain; and the return of
knights is there required, but not a word of the boroughs;
a demonstration, according to Brady (of Boroughs), that this
was the very year in which they commenced.
After the election of these deputies by the aldermen
and common-council, they gave seisin to their attendance be-
fore the king and parliament; their charges were respec-
tively borne by the boroughs which sent them; and they had
to little idea of appearing as legislators,—a character so re-
monstrative from their low rank and condition,—that no intellig-
ence could be more difficult to any borough, than to find that
they must elect, or to any individual, that he was elected to a
trust, from which no profit or honour could possibly be
derived. Properly speaking, they did not compose any essent-
ial part of the parliament; they sat apart both from the barons
and knights, who disdained to mix with such mean person-
ages; and after they had given their consent to the taxes
required of them, their sullenness being then finished, they
separated, even though the parliament still continued to sit
and canvass the national business. As they were all real
burgesses of the places from which they were sent, the sher-
iffs, when he found no person of abilities or wealth sufficient
for the office, often took the liberty of omitting particular
boroughs in his returns; and as he received the thanks of
the people for this indulgence, he gave no;display to the court,
which levied on all the boroughs without distinction the
tax agreed to by the majority of the deputies. It was
not till the reign of Richard II. that the sheriffs were de-
prived of the power of omitting boroughs at pleasure.
5 Ric. II. cap. 4.
The union of the representatives from the boroughs gra-
dually gave more weight to their whole order; and it be-
came cumbrous for them, in return for the supplies which
they granted, to prefer petitions to the crown for the redrefs
of any particular grievance, of which they found reason to
complain. These petitions received the function of royal
authority, and acquired validity, even without the consent
of the nobles. Afterwards, however, the house of peers,
the most powerful order in the state, reasonably ex-
pected, that their assent should be expressly granted to all public
ordinances; and in the reign of Henry V., the commons
required that no laws should be framed merely upon their peti-
tions, unless the statutes were worded by themselves, and
had passed their house in the form of a bill. At this time,
the commons were much below the rank of legislators; and
throughout the reign of Edward I., their assent is not once
expressed in any of the enacting clauses; nor in the reigns
following, till the 4th of Edward III. nor in any of the enact-
ing clauses of 16 Ric. II. Nay even so low as Henry VI.
from the beginning till the 8th of his reign, the assent of the
commons is not once expressed in any enacting clause. Pref.
to Rushhead's edition of the statutes, p. 7. The commons
were so little accustomed to transact public business, that
they had no speaker till after the parliament 6th Edw. 11.;
and in the opinion of most antiquaries, not till the 11th of
Richard II. The house of representatives from the counties
were gradually separated from that of the peers, and formed
a distinct order in the state. Nevertheless the knights of
shires did not form the same house with the burgesses. But
by degrees the growth of commerce augmented the private
wealth and consideration of the burgesses; the frequent
-demands of the crown increseced their public importance; and as
they represented particular bodies of men, resembling in this
respect the knights of shires, they were united together in the
same house. Mr. Carter, after having carefully consulted
the rolls of parliament, affirms (Hist. vol. ii. p. 451.), that they
never appear to have been united till the 10th of Richard
III. But this union does not seem to have been final; for,
in 1378, the burgesses acted by themselves, and voted a tax
after the knights were dismissed; and influences occur at later
periods of their acting separately. The chief baron Gilbert
(Hist. of the Exchequer, p. 37.), is of opinion, that the
reason why taxes always began with the commons, or bur-
geesses, was, that they were limited by the instructions of their
boroughs. In the manner above stated, the third estate, or
that of the commons, reached at last its present form; and
as the country gentlemen made themselves forwards no scruple
of appearing as deputies from the boroughs, the distinction be-
tween the members was entirely lost, and the lower house
thence acquired a great accession of weight and importance
in the kingdom. Still, however, the office of this claret
was very different from that which it has since exercised with
so much advantage to the public. Instead of checking and
controlling the authority of the king, they were naturally
induced to adhere to him, as the great fountain of law
and justice, and to support him against the power of the
aristocracy, which was at once the source of oppression to
themselves, and disturbed them in the execution of the laws.
The king, in his turn, gave countenance to an order of men
so useful, and so little dangerous; the peers were also
obliged to pay them some consideration; and thus the third
estate, formerly so abject in England, as well as in all other
European nations, rose by slow degrees to its present im-
portance; and in its progress, made arts and commerce, the
necessary attendants of liberty and equality, flourished in the
kingdom.
In addition to what has been already advanced, Mr.
Hume alleges a further evidence, that the commencement of
the house of burgesses, who are the true commons, was not
an affair of chance, but arose from the necessities of the pre-
sent situation; viz. that Edward, at the very same time,
summoned deputies from the inferior clergy, the first that
ever met in England, and required them to impose taxes on
their constituents for the public service.

6
On the other hand, it has been argued by the advocates of the higher antiquity of the commons, that if we look to the best accounts of the original customs of the ancient German nations, we shall find, that, in their communities, all the freemen enjoyed an equal right with the nobles to sit in deliberations on affairs of great moment. See Tacitus de Moribus German. c. 25. Upon their first settlement in any foreign country, and while their number was small, this right might be exercised, without much inconvenience, by the whole body of the freemen assembl'd together on open plains. To this purpose, Matthew of Westminster (Sub. Ann. 1213. Johan. 15.) intimates, that the Angle-Saxons, after they came into Britain, exercised their right in this manner; for he says, that the meadow near Stainton, in which King John granted the great charter, was called "Rumewed," denoting in the Saxon language the "meadow of counsel," because from ancient times it had been usual to consult there upon business which concerned the peace of the kingdom. But this custom had been diffused under, and even before, the government of the Normans; perhaps from the time in which the Saxen heptarchy was united into one kingdom. The only instance that occurs of its having been revived is the meeting in the reign of King John; all the parliaments, or great councils, of which we have any account before, were held in churches, abbeys, or royal castles; and therefore, if the right of the freemen continued, the greater part of them must have exercised it, not personally, as in ancient times, but by their representatives. By a record cited by Dr. Brady, so late as the fifteenth year of King John, it appears that not only the greater barons, but all the inferior tenants in chief of the crown, had a right to be summoned to parliament by particular writs; and therefore we may conclude, that till that time, no representatives had been sent by any of these to serve for them in parliament; but they attended the great councils of the nation in their own persons; and their number was not so considerable, as not to allow of their being accommodated in the body of a church, or the great hall of an abbey or castle. But there were far from being all the freemen of the kingdom, for this description comprehend all who held of the barons, either by knight-service, or free fagation, and all the possessors of alodial estates, with all the freemen of cities and boroughs not holding of the crown. The number of all these was too great to be contained in any building however spacious. But were these men either wholly excluded from parliament, or were they present there by any kind of representation? Some learned writers have supposed, that every superior lord, who held of the king immediately and in chief, gave an opinion on matters of government, which bound all his vassals. But if this were the case, the possessors of alodial estates, to which classes we may refer all the parochial clergy, having no superior lord to act for them in parliament, could not be thus represented or virtually bound by the act of the king's barons, to which they were not attached by any feudal connection, and of whom they held nothing. Besides, the knights, citizens, and burgesses, who are now representatives of the commons of England, are elected by those for whom they hold land, and on occasion of every new parliament, the electors are at liberty to make a new choice: whereas, the representatives, in the above hypothesis of Sir H. Spelman, were neither elected nor liable to be changed at any peril of time, by those whom they represented; their right to sit in parliament not arising from any truce conferment to the people, but wholly from their tenures. It is also certain, that the feudal superiority was the same under the government of Henry III. as of William I., and continued so for some ages. If therefore the barons, and superior lords of great fiefs, holden immediately of the crown, had, by virtue of the institutions of William I., been supposed to represent their vassals in parliament, and the notion then was, that every feudatory, holding by a meane tenure, was bound by the parliamentary acts of his lord, how came that notion to be discarded in the 49th year of Henry III. or under the reign of his son, or at any time afterwards? A baron, who held of the crown, was to all intents and purposes the head of his vassals, in the reigns of Edward I. and Edward III., as much as in any of the preceding reigns. How happened it then, that the concept of these vassals to the making of laws, or any other act of moment to the public, was not still included in the vote of their lord? Why was it given, against the course of former proceedings, not by them, as their representative, but by knights of the shire, or by citizens, or by burgesses, chosen by the vassals? Some have referred this change, as we have above stated, to the earl of Leicester, in the 49th year of Henry III. But an existing record, it is said, demonstrates this date to be false. A writ of summons, directed to the sheriffs of Bedfordshire and Buckinghamshire, and requiring two knights to be sent for each of these counties, is extant in the chace roll of the 30th year of Henry III. And there is also a clause in the great charter, of the 9th of the same king (see Dr. Blackstone's edition of the charter), whereby it is declared, that, together with the episcopal and temporal lords, other inferior freeholders, comites de regno, by which words lord Lyttleton understands "the whole commonality of the realm," granted to the king the fifteenth part of all their moveable goods, in return for the liberties accorded to them in that charter." "Nor," says his lordship ("ubi infimus, "can I discover in the history of those times any reason sufficient to render it probable, that so great an alteration should then have been made in the constitution of England." Such an alteration must have produced disputes, which would have been noticed by some of the numerous historians of that age. But the English history is altogether silent as to any disputes between the nobility and the people, on this account, from the earliest times of the Saxon government down to the reign of Charles I. Hence it may be reasonably presumed, that the rights of the commons must have been incompletely established by custom, and interwoven into the original frame of our government. It is hardly conceivable, that the admission of all the lower orders of freemen, or indeed of any large number, to the great council of the kingdom, and to a participation of the legislative power, to which they had no right before, should have been brought about, and yet pass unobserved by any writer who lived in that age. If we suppose, as some have done, that the sitting in parliament was at this time regarded only as a trouble and burden, the imposition of such a burden on orders of men, who had been before exempt from it, must have been felt by their part resisting and opposed. But from the act of the 4th of Edward III., which is thus worded, "It is assented, that a parliament shall be holden every year once, and more often, if need be," we may infer, that it was generally regarded in a very different light, rather as a privilege, of which they earnestly desired the frequent enjoyment, than as a burden, from which they wished to be exempt. It is true, some boroughs, which, on account of their poverty, were unable to bear the expense of sending members to parliament, declined the exercise of that privilege; but it would be unfair to allege this circumstance, which occurred in particular instances, as an argument in favour of the general enfranchisement of counties, cities, or other more wealthy boroughs. Besides, there are some instances of boroughs that petitioned to be restored to the use of the privilege of sending members to parliament, after a very long interruption.
interruption. Moreover, it seems incredible, that if the
whole legislative power had, before the reign of Henry III.,
been always placed in the nobility and the king, they should
not have opposed the extension of it to so many persons
of lower rank in the state : more especially as the power of the
nobility was never higher than it was in this reign. With
regard to the earl of Leicester, it was not his interest, while
he was acting at the head of the nobles and people, to take
a very dangerous course against the crown, to make any
innovations edictive or distributive to either of those bodies; nor is it
probable, that any new institution begun by that earl, should
have been confirmed and perpetuated by Edward I. Among
the chief acts of the 24th of this king, there is a writ of
summons to parliament, already cited, in which it is asserted,
not as an innovation introduced by the earl of Leicester, but
"a maxim grounded on a most equitable law, established
by the foresight and wisdom of dear princes, that what con-
cerns all, should be done with the approbation of all; and
that dangers to the whole community, should be obviated by
remedies provided by the whole community." If the earl
of Leicester, or even if Edward I., or his father, had intro-
duced the practice of summoning the commons to parliament,
Edward could not with propriety have used this language.
It is further alleged, that there is not in any of the oldest
writs for sending up representatives from cities or boroughs
the least intimation, that such elections were a novelty then
introduced. Some writs are taken notice of by Mr. Tyrell,
"an industrious searcher of records on this subject," which set
forth a claim of certain tenants in ancient demesne, before
the 15th year of Edward II., that they ought not to be
charged with wages to knights of the shire: "forasmuch as
they and their ancestors, tenants of the same manor, had,
from time beyond memory, been always exempted, by
custom, from the expences of knights, sent by the community
of their county to the parliaments of the king, and of
his royal progenitors." A time beyond memory is defined
by our law-books to be a time antecedent to the beginning
of the reign of Richard I.; and if no wages had been ever
paid to knights of the shire till the reign of Henry III.,
it would have been preposterous for these persons to tell the
grandson of that king, that they had enjoyed a customary
privilege of not paying wages from time beyond memory,
which must be supposed, when this exemption was claimed,
to go much further back than the reign of Richard I.
With regard to cities and boroughs, there are likewise
extant two claims, made in the reigns of Edward II. and
Edward III., which seem to decide the feme of that age con-
cerning the antiquity of the custom of citizens and burgesses
coming to parliament; and from towns that were held under
subjects, not immediately of the crown. These are the
claims of the towns of St. Albans and Barnstable. In the
petition of the borough of St. Albans, first taken notice of
by Selden, and then by Petty, Brady, Tyrell, and others,
and presented to parliament in the reign of Edward II.
the petitioners assert, that though they held in capite
of the crown, and owed only for all other service their attendance
in parliament, yet the sheriff had omitted them in his writs;
whereas, both in the reign of the king's father, and all his
predecessors, they had always fent members. This expres-
sion, it is alleged, could not have been used, if the com-
 mencement of the house of commons were in the reign of
Henry III. However, Madox, in his "History of the
Exchequer," p. 522, &c., has endeavoured to destroy the
authority of this petition for the purpose to which it is ad-
duced. He asserts, first, that there was no such tenure in
England, as that of holding by attendance in parliament,
instead of all other service; and secondly, that the borough
of St. Albans never held of the crown at all, but was always
done as land of the abbot. It is no wonder, therefore,
says Mr. Hume, that a petition, which advances two false-
hoods, should contain one historical mistake, which indeed
amounts only to an inaccurate and exaggerated expression;
no charge matter in ignorant burgesses of that age, who
wished to shake off the authority of their abbot, and to hold
of the king, without rendering any services even to the
crown. See the discussion of this subject, and an examina-
tion of the reasoning of Madox and Dr. Brady, in Lyttel-
ton's "Hist. of Eng." vol. iii. p. 495, &c. The advocates for
the antiquity of borough representatives further refer to a
flattery of the 5th year of Richard II. (cont. 2. which enacta,
that all and singular persons and commonalities, which from
henceforth shall have the summons of the parliament, shall
come from henceforth to the parliaments in the manner as
they are bound to do, and have been accustomed within the
reign of England, of old times. And if any person of the same
realm, which from henceforth shall have the said summons
(be he archbishop, bishop, abbot, prior, duke, earl, baron,
banister, knight of the shire, citizen of city, burgess of
borough, or other singular person or commonality), do absent himself,
&c., he shall be amerced, and otherwise punished, according
as of old times hath been used to be done within the said realm
in the said cafe." Upon this statute it is argued, that it makes
no distinction between the antiquity of summons to parlia-
mant sent to the greater nobility, and those to citizens, burg-
geffes, and knights of the shire. Besides this remarkable
testimony of the whole legislature in the reign of Richard II.
to the antiquity of the custom of the commons coming to
the parliament, we have a petition of the commons in the second
parliament of the reign of Henry V., which sets forth to
that prince, "that as it hath ever been their libertie and fre-
dom, that there should no statute nor law be made, unless
they pait thereto their assent, considering that the commune
of your land, the which is and ever hath been a member of
your parliament, be as well affenter as petitioners, &c." This
claim was not disallowed either by the lords or the
king. Besides these authorities drawn from statutes and re-
cords, it is said, that very evident indications of the preference
of the people in the national councils, and of their being
conscientious parts thereof, and in a disorderly manner, are to
be found in some ancient histories, and contemporary ac-
counts of transactions in parliament, from the death of Ed-
ward the Confessor to that of Henry II. Several instances
to this purpose, occurring in the reigns of William the Con-
queror, William Rufus, Henry I., Stephen, Henry II.,
&c. are produced by lord Lyttelton, in the Notes to his
"Hist. of Eng." vol. iii. p. 421, &c. We may further add, that
the preference of the people in the Saxon councils, and their
having had a share in the highest acts of legislature and go-
vernment, even till the entrance of the Normans, seems to be
proved very strongly from the preamble of laws and other
proceedings of those councils, and from the words of the best
historians who lived near to those times. On this long usage,
says lord Lyttelton, their right was established; and it ap-
pears to have been continued under William the Conqueror,
with other customs and rights confirmed by him to the na-
tion, and under his successors, by like sanctions of ancient
liberties granted in repeated royal charters. In ancient
times, however, the property of the commons was so une-
equal to that of the nobles, and the feudal obligations of the
inferior landholders to the lords under whom they held,
created such a dependence of the former on the latter, that
although, in the idea and scheme of the government, a pop-
ular power was mixed with the regal and aristocratical, yet,
in reality, the scale of the people was not weighty enough
to make a proper counterpoise to either of the others. The
commons usually declined to give their opinion or advice to the
crown, in certain matters of state, and submitted their
judgment respecting them to the king and his council, or to
them and the lords. While the representatives of cities, towns,
and boroughs, were chosen only out of persons resident in them,
they were generally people of low degree and condition, whose
education and way of life rendered them very unfit to judge of
arduous questions concerning foreign affairs, and treaties
with foreign states. Nevertheless, even in the earliest times,
so far back as we have any rolls of the parliament, all the
commons appear to have given their advice with great free-
dom in matters concerning the internal government and order
of the kingdom. What they declined to advise is, upon
some occasions, were questions that related to the making of
peace or war. Mr. Hume, indeed, affects, on the authority of
a citation from Sir Robert Cotton's abridgment of the
records in the Tower, that the commons in these times were
much below the rank of legislators, and that they were
considered by the king merely as petitioners, or deputie of any
proper legislative authority. But the whole passage, cited
by Lord Lyttelton, seems to confirm, instead of denying
their legislative authority. In the king's answer to their
application, they are truly told, that the power of judica-
ture does not pertain to them, but to the king and the
lords; and this was the question to which their prayer re-
lated; but in statutes they were to judge, as well as in
grants, subsidies, &c. Their being petitioners was cer-
tainly no argument against their being legislators; since
the course of proceedings then was, that their petitions, if
affixed to by the lords and the king, should be turned into
statutes, as all the old records of parliament unquestionably shew.

Burgesses were first admitted into the Scottish parliaments
by Robert Bruce, A.D. 1326; and in the preamble to the
laws of Robert III. they are ranked among the constituent
members of that assembly. Brady of Boroughs. Petyt's
Right of the Commons. Brady's Answer to Petyt. Tyr-
of England, vol. i. and ii. Appendix i. and ii. Lyttelton's
History of Henry II. vol. ii. Robertson's Hist. of Scot-
land, vol. i. p. 79. See WITTENAGENOTE, and Par-
liament.

Borough, in Scots Law, is a body corporate, consisting
of the inhabitants of a certain tract of ground, erected by
the sovereign, with jurisdiction annexed to it. Boroughs
are erected either to be held of the sovereign himself,
which is the general case of royal boroughs, or of the supe-
rior of the lands so erected, as boroughs of regality and ba-
rony. The former are empowered, by their charters, to
chose annually certain office-bearers, or magistrates; but
in the latter, the nomination of magistrates is, by their
charters, lodged sometimes in the inhabitants, sometimes in
the superior. Bailies of boroughs have jurisdiction in mat-
ters of debt, servit, and questions of possession between the
inhabitants. Their criminal jurisdiction comprehends petty
riots, and reckless fire-raising. The dean of gleng is that
magistrate of a royal borough, who is head of the merchant-
company; to him belong the cognizance of mercantile
causes within the borough, and the inspection of buildings,
that they may stand, either on private property, nor on the
public streets; and he may direct incompetent houses to be
pulled down. His jurisdiction has no dependence on the
court of the borough, or bailie-court.

Boroughs, Royal, in Scotland, are corporations made
for the advantage of trade, by charters granted by several
of their kings, having the privilege of selecting commissioners
to represent them, besides other peculiar privileges.

These form a body of themselves, and send commissioners,
each to an annual convention at Edinburgh, to consult
the benefit of trade, and the general interests of the boroughs.
According to Chamberlaine, they have the sole power of
trade and merchandise, exclusive of all others, a power of
holding courts, exercising the jurisdiction of sheriffs, making
by-laws, &c.

The company of merchants in a royal borough make
what is called a gild; the chief of which is a dean of gild,
who is next magistrate to the bailiff. See Gill.

The royal boroughs are not only so many distinct corpo-
lations, but do also constitute one entire body, governed by
and accountable to one general court, ancienly called the
"court of four boroughs," held yearly to treat and deter-
mine concerning matters relating to the common advantage
of all boroughs. The four boroughs which composed this
court were Edinburgh, Stirling, Roxburgh, and Berwick;
which two last falling into the hands of the English, Lit-
lithgow and Lanark were put in their places; with a faving
to the former, whenever they should return to their alleg-
iance. But this court not being sufficient to answer the
necessities of the royal boroughs, they were all empowered,
under James III. in 1487, to send commissioners to a yearly
convention of their own, which was then appointed to be
held at Inverkeithing, and is now held at Edinburgh, under
the denomination of the convention of boroughs, vested with
great power.

Borough-Courts, in Law, are certain courts held in bo-
roughs, by precept, charter, or act of parliament: such
are the sheriff's court, and court of holdings in London.
See Court.

Borough-English, so named in contradistinction, as it
were, to the Norman customs, and noticed by Glanvil (l. 7,
c. 3.), and by Lisletton (f. 165); denotes a customary de-
cent of lands or tenements in some ancient boroughs and
copyhold manors, whereby they come to the youngest, in-
stead of the eldest son; or if the owner hath no issue to the
youngest, instead of the eldest brother; because, according
to Lisletton, the youngest is supposed, in law, the least able
to shift for himself. 1 Inst. 110 b. And in support of this
reason, other usages in favour of the youngest are alleged,
as that in Kent, where the lands being equally divided amon-
g all the sons, the youngest is to have the privilege of all or
barrat in the manor-house, in his share, as being supposed
the tenderest, and more in need of warming. Others, not
withstanding, suspect a different reason for the rise of bo-
rough-English, viz. that the places, where this custom now
 obtains, were anciently liable to that custom granted to the
lords of manors in Scotland by King Edgar, who had the
privilege of enjoying the hill night of their tenants' brid-
es; so that the eldest son being preferred to be the lord's,
they usually settled their lands on the youngest son, whom
they thought their own; which being practiced a long time
went at length into a custom. The custom, however, never
obtained in England, though it did in Scotland, under the
name of "mercetas," or "mercetes," till it was abolished
by Malcolm III. Perhaps, says Judge Blackstone, in the
origin of this practice may be illustrated by that of the Tar-
tars, mentioned by D'Heude, among whom the same cus-
tom of descent to the youngest son prevails. As the na-
tion is composed of shepherds and herdsmen, the eldest
sons migrate from their father with an allotment of cattle, to
seek a new habitation. The youngest son, continuing alone
with his father, is naturally the heir of his house: the rest
being already provided for. This custom of migrating obtained
in many other eastern nations; and borough-English may
be a remnant of that pastoral state of our North and Ger-
man.
man's ancestors, which Caesar and Tacitus describe. Black- f
te's Comm. vol. ii. p. 38. A. This custom goes with the land, and directs the de- 
to the young son, although there be a devise to the contrary. 2 Lev. 12. 8. If a cophaholol to a borough-English be fore- 
cared to the use of a person and his heirs, the right will de- 
ferred to the youngest son, according to the custom. 1 Mod. 
302. And a youngest son shall inherit an estate in tail, in 
borough-English. Nov. t. b. But an heir at common law 
shall take advantage of a custom annexed to a borough-English 
land; though the youngest son shall be entitled to all actions 
in right of the land. 1 N. Abr. 376. And the elder son 
shall have tythes arising from borough-English land; for 
tythes of neglected right are not inheritable descendable to 
an heir, but come in succession from one clergyman to an- 
other. Ibid. 147. Borough-English land being descend- 
able to the youngest son, if a sonnder son dies without issue 
male, leaving a daughter, such daughter shall inherit "jure 
representationis." i Salk. 243. By this custom the landlord 
shall have the whole of the husband's lands in dower, called 
her "free-bench," and it is given to her to enable her the 
better to provide for the younger children entrustled to her 
care. Co. Litt. 3. 111. F. N. B. 1, 2. Mo. Pl. 566. As 
borough-English is particularly noticed by the law, it is un- 
necessary to prove that such custom actually existed, but only 
that the lands in question are subject to it. i Comm. 76. 
But the extension of the custom to the collateral line must 
be specially pleaded. Robin. on Gavelkind, 38. 43. 93.

Borough-Head, or Borough, was one of the lowest 
magistrates among the Anglo-Saxons, and the chief man of 
the decennary, tithing, or free-bench, confiding of ten 
haless, chosen by the reyl to speak and act in their behalf. He 
is also called the tithing-man, and, in some counties, the 
borough-holder, bors-holder, or borough's elder, being 
supposed the different man in the borough, town, or 
tithing.

According to the institution of Alfred, every householder 
was answerable for the behaviour of his family and slaves, 
and even of his guests, if they lived above three days in his house; 
and ten neighbouring householders formed themselves into a 
corporation, under the name of a decennary, or tithing, of 
which the heald-borough, or bors-holder (derived from the 
Saxon word bors, a servi, and older, a held or chief), was 
the president, and they were answerable for the conduct of 
each other. Every man was punished as an outlaw, who did 
not regard himself in some tithing; nor could any one 
change his habitation, without a warrant or certificate from 
the bors-holder of the tithing to which he formerly belonged. 
When any person in any tithing was guilty of a crime, the 
bors-holder was summoned to answer for him; and if he were 
not willing to be surety for his appearance and his clearing 
himself, the criminal was committed to prison, and there de- 
tained till his trial. If he fled, either before or after finding 
sureties, the bors-holder and decennary became liable to in- 
quiry, and were exposed to the penalties of the law. Thirty- 
one days were allowed them for producing the criminal; and 
if they did not find him within that time, the bors-holder, 
with two other members of the decennary, was obliged to 
appear, and, together with three chief members of the three 
neighbouring decennaries (making twelve in all), to swear 
that his decennary was free from all privy both of the crime 
committed, and of the escape of the criminal. If the bors-
holder could not find such a number to answer for their inno- 
cence, the decennary was compelled by law to make satisfac- 
tion to the king, according to the degree of the offence. 
The severity of this regulation was afterwards a little mi- 
gated, and the oaths of all the members of the tithing to

which the criminal belonged, to the above effect, were ad- 
mitted as a sufficient exculpation, provided that, at the same 
time, they promiss, upon oath, to present him to justice, as 
soon as they could apprehend him. By this institution, every 
man was obliged, from his own interest, to keep a watchful 
eye over the conduct of his neighbours; and was in a man- 
ner surety for the behaviour of those who were placed under 
the division to which he belonged; and hence these decennaries 
received the name of frank-pledges. See Tithing.

In many parishes, head-borough also signifies a kind of 
head constable, where there are several chosen as his affilia-
tes, to serve warrants, &c. See Constabull.

Borough, or Borg, denotes a pledge or security for an-
other's keeping the peace, and conforming to the laws. The 
word is Saxon, and is sometimes also written borough; in 
Latin writers, borgia and borgia.

Borough-breach, Borgi fractura, in Ancient Law Writers, 
denotes a breaking of the pledge or security given by the 
members of tithings for the behaviour of each other.

This is the name with what is otherwise called borg-benge, 
borg-berge, borg-brecly, and borgi fractura.

Boroughs, Borough, or Boroughs, in the law of Scotland, 
the same with what in England is called binding to the peace. 
In case of a contravention of law-boroughs, the surety or 
cauterizer is equally liable with the principal for the penalty 
specifiee therein, the one half to the king, and the other to 
the complainant.

Borough-Bridge, in Geography, an ancient bo-
rough town of Yorkshire, in England, derives the latter part 
of its name from a handstone stone bridge over the river Ure. 
This place was formerly called Newborough, in contra-

distinction from Alfborough or Old-borough, a village about 
one mile distant. Each of these places has the privilege of 
feeding two members to parliament; and as both are included 
in one parish, that parish has the singular power of returning 
four members. Alfborough first made a return in 1558, 
and New-borough in 1553: The former place is attributed, 
by many respectable writers, to Roman origin, and is said to 
be the Ituration, which was placed on the Watling-

 direct, 17 miles from Eboracum, or York. The ancient 

walls of this town (Iturium), observs Mr Gough, though 
level with the ground, may easily be traced in a circumference 
of more than a mile and a half. They include an area of an 
oblong square, containing about 60 acres, which lies to the 
river Ure. The walls, near four yards thick, were founded on 
large pebbles, which were laid in a bed of blue clay. Near 
the centre of the Ituration was a hillek, called Borough-hill, 
which seems to have been the citadel, where foundations of 
buidlings, Mosaic pavements, &c. have been discovered. 
A fidatory, with sculptured altars, numerous coins, urns, and 
other relics of the Romans have been found at this site, 
which was evidently of much consequence in Roman Britain, 
although probably subordinate to the great one at 
Eboracum. It is generally written Iturium Brigantium, 
whence Hostyler infers that it was the capital of the Brigantes. 
A particular account of the antiquities found here, with en-
gravings, may be seen in Gough's edition of Camden vol. iii.

p. 59, &c. and a very judicious account in Hargrove's 
History of Knareborough, fifth edition, 15mo. 1798.

Borough-Bridge is only a small town, with 114 houses 
and 686 inhabitants. It belongs to the parish of Alfb-
borough, and has a chapel of ease to the mother church. 
In the centre of the town is a church, or obelisk, about twelve 
feet high, of the same species of stone as the Devil's Arrows, 
which are at a short distance west of the town. These sin-
gular stones have excited much curiosity among antiquaries, 
and furnished a theme for various conjectural dilussions.
There were formerly four stones, raised upright in the ground, but one of them was demolished in the last century. The remaining three stand about two hundred feet from each other, are of an oblong shape, and of a transparent base. The tops seem as if split, and the sides are indented, or furred, for a certain space downwards. This appearance induced false writers to assert that they were fluted by art; but it is more probable that the weather effected this operation. The height of the tallest stone is twenty-two feet and a half from the ground, and its greatest circumference fifteen feet in girth. Its depth in the ground is four feet and a half. Another stone measures twenty-one feet high by seventeen feet in girth; and the third stone is seventeen feet high, by twenty-two feet in circumference. Mr. Drake (in his history of York) supposes that they were trophies raised by the Romans; Leland is of the same opinion: but Dr. Gale conjectures, that they were Hibernian, and from their particular position pointed to four different Roman roads that met at this place. Doctors Plot and Stukeley attribute them to the Britons, and this seems the more probable, as we are well assured that the primitive inhabitants of Britain raised various single upright stones, and different circles of stones of varied diameters and magnitude. This, says Mr. Pennant, were either monumental memorials of departed heroes, on rude objects of worship, such as the Iracrites bowed to, when they departed from the purity of adoration. Such objects are fabled in Wales Mcini-biron, or the long stones, and Mcini-grays, or the ambofal stones, as described by Bryant and others.

The river Ure is not navigable higher than Boroughbridge, near which the canal from Ripon communicates with it by means of a lock. About two miles and a half below the town, the river Swale joins the Ure. Boroughbridge, Altrborough, and the manor, honour, and castle of Knarborough, were, in the 13th of Henry III., granted to the famous Hubert de Burgh, upon his paying a tax a year into the exchequer, but were forfeited by his son in the same reign for joining Simon de Montfort at the battle of Evesham. Boroughbridge remained in the crown till the reign of Edward I., when it belonged to his insolent favourite Peter Cauoll. It now belongs with the barony of the two baronies, to the duke of Newcastle. Near this place, in 1322, a battle was fought between the soldiers of Edward II. and prince Thomas, earl of Lancaster, when the latter was taken prisoner, and, after suffering various indignities, was beheaded. Most of his partizans were taken, and Icon was slain; among whom was John de Bohun, earl of Hereford, who, in passing over the wooden bridge of this place, was killed by a lance from a soldier lurking beneath the bridge.

This town was a weekly market on Saturdays, and twice fairs annually; the principal of which, in June, continues for a week, and is much frequented by the manufacturers from Sheffield, Birmingham, Wolverhampton, &c. Harrogate's History of Knarborough. Gough's edition of Camden's Britannia. Pennant's Tour from Alton Moor to Harrogate, p. 108.

BOROVITCHI, a town and district of Russia, in the government of Novgorod, situated on the river Ilza; 88 miles E.S.E. of Novgorod, and 168 S.E. of Petersburg.

BOROWA, a town of Bohemia, in the circle of Czaltat, 8 miles N.E. of Tetzch Bred.

BOROWICA, a town of Poland, in the palatinate of Volhynia; 20 miles N. of Lucko.

BOROWICK, a town of Poland, in the palatinate of Kiot, 52 miles S.E. of Czarki.

BOROWNIZA, a town of Bohemia, in the circle of Koniggratz, 18 miles S.E. of Koniggratz.

BOROWSKO, a town of Bohemia, in the circle of Czaltat; 7 miles W. of Ledetchte.

BOROZAIH, in Hungary, a village which resembles the yaws, frequent among the Africans inhabiting the banks of the river Benegil. See Yaws.

BOROZDINKA, in Zerow, a fortress of Kuffen Tartary, in the government of Caucasus, on the Ural; 32 miles N. of Cmiel.

BORRAK, in Boethia. See Borago.

BORRELISUS, in Historical History, a left or fort of Ambabists in Holland, who allow of no use of sacraments, public prayers, or other external worship, nor of any human gloss, or explication of scripture: but protest to adhere to the faith and manners of the New Testament times in all their simplicity.

They took their denomination from their founder, Burrel, a person of great learning in the Hebrew, Greek, and Latin tongues, and brother of M. Borel, ambassador of the States to the French king.

BORRI, Joseph Francis, in Latin Burford, in Biography, an impeller and empiric of the 17th century, was born at Milan, about the year 1625, and educated in the Jesuits' seminary at Rome. In early life he was notorious for his licentious conduct; but afterwards assuming the character of a religious devotee, he declaimed against the corruption of the age, and pretended to supernatural visions and revelations. Preaching the powers of the inquisition at Rome, he removed to Milan, where he established a new sect, confining its operations to those whom he attached to himself and his cause by vows of secrecy, and whom he deprived of their property by enforcing the obligation of voluntary poverty. With the affluence of his deluded followers, and by means of a sword which he pretended to have received from heaven, he proposed to compel all mankind to unite in one (speech-fold, of which he was to be the shepherd and superintendant.

Among his other fancies and chimeras, one of his most distinguishing devises was that of the dedication of the virgin Mary, whom he conceived to be the only daughter of God, and the Holy Ghost incarnate. Arrogating to himself a divine mission, he assumed the privilege of conveying illumination to his followers by the imposition of hands; and after gaining a sufficient number of adherents, it was his intention to open his seminary at the great affairs of Milan, and there to inveigh against the civil and ecclesiastical abuses of government, to maintain the people to recover their liberty, and to seize the city and its territories, with a view to more extensive conquests and dominions. As soon as some of his disciples were arrested and imprisoned, he made his escape, and the inquisition proceedings against him, declared him contraceptors, condemned him as a heretic, and caused his effigies to be publicly burnt at Rome. At this time, viz. in 1660, he fought an asylum at Amsterdor, and there he found a convenient theatre for the further exercise of his impostures. Having assumed the characters of a chemist and physician, he pretended to extraordinary skill in the cure of all kinds of distempers, set up a splendid equipage, and assumed the title of excellence. But when his credit sunk, and his resources derived from the art of swindling failed, he fled from Amsterdam in the night, taking with him all the money and jewels he could collect, and removed to Hamburg, where he imposed upon queen Christina, by pretending to be the secret of the philosopher's stone; but when her means of encouraging this debauch failed, he removed to Denmark, and obtained from the king profuse supplies. Upon the death of the king, he thought it most prudent to make his escape, and in his flight towards Turkey, he was apprehended on the German frontier by bailme, as a political criminal.
name being accidentally mentioned to the emperor in the presence of the pope's nuncio, he was demanded as an heretical offender, and delivered up by the emperor on condition that his life should be preferred. Upon his arrival at Rome, he was sentenced to abjure his errors, to do public penance, and to be imprisoned for life. In prison he was visited by several persons of rank, who referred to him in consequence of the fame of his adventures; and having performed a cure on the duke d'Ette, the French minister, who had been given over by several physicians, he obtained some degree of liberty, and at length a removal to the castle of St. Angelo, where he was allowed to prosecute his chemical experiments, and where he died in 1645. Some writings were attributed to him, and printed at Geneva in 1681; one, entitled "La Chaise del Cababito," i.e. the key of the cabinet, being a series of letters relative to alchemy and the Rosicrucian philosophy; and the other, "Irruzioni Politiche," or a set of political aphorisms, with a commentary addressed to the king of Denmark. The Bibliotheca Medicae contains also two of his letters, printed at Copenhagen in 1669, and written to Bartholin: one, "De ortu cerebrui et unico medico," the other, "De articfio oculorum humorum remittendi." König attributes to him another piece, entitled "Noticia gentis Burnhorum."

Borri combined a considerable portion of cunning and artifice with his enthusiasm, and thus became capable of practising more successfully on the credulity of mankind. His fancies with regard to the new celestial kingdom, which he pretended a mission to establish, and the downfall of the Roman pontiff, which he threatened to accomplish, are so extravagant, childish, and absurd, that they can be viewed by sober persons in no other light than as the crude reveries of a disordered brain. In his conduct he manifested, on various occasions, the greatest vanity and levity, accompanying that spirit of importunity which is universally displayed by quacks and mountebanks; and, indeed, says Moheim, "in the whole of his behaviour, he seemed delirious of sense, integrity, and prudence." Gen. Dict. Moheim's Eccl. Hist. vol. v. p. 240.

BORRIANO, in Geography, a town of Spain, at the mouth of the river Millas, in the gulf of Valencia; 7 leagues N. of Valencia.

BORRICHUS, Olaus, in Biography, the son of a Lutheran minister at Ripen in Jutland, was born April 6th 1626. At the age of 18 he was sent to Copenhagen, where he applied with so much avidity to his studies, as to gain him the friendship of the superiors of the college, by the recommendation of whom he obtained the canonry of Lundeen. By continuing this course of life, his reputation for learning and diligence was so establisht, that in 1654, when he was only 25 years of age, he was invited to accept the regency of the academy at Herlow. But as he had determined to dedicate his time to the acquirement of the knowledge of medicine, he refused this offer, purposing to spend a few years in visiting foreign academies, and hearing the most celebrated professors in the different branches of that art. The execution of this project was, however, postponed; at the instigation of M. Gedlorff, the prime minister of Denmark, who entertained him at his house as preceptor to his sons. Here he continued five years, at the end of which time, as a proof of the satisfaction he had given, and of the opinion the minister had conceived of his various endowments, he was at once created professor in philosophy, poetry, chemistry, and botany, in all of which he eminently excelled. Before he entered on the duties of his offices, he was permitted, agreeably to his original intention, to visit the different schools of Holland, England, France, Germany, and Italy, accompanied by the two sons of the minister, his pupils. Having spent six years in this tour, and stored his mind with the knowledge of all that was curious or useful, in the countries he passed through, and taken his degree of doctor in medicine at Angers, he returned in October 1666 to Copenhagen. He now undertook the duty of lecturer in chemistry and in botany; and by the excellence of his discourse on these subjects, confirmed his countrymen in the high opinion they had entertained of his talents. Though the time necessarily spent in this employment, and in preparing his numerous publications, left him, one would have thought, but little leisure for the practice of physic, yet from the great number of valuable observations furnished by him to the Acta Hassiennia, he must have had no inconsiderable share of business in that way. In 1686, he was made counsellor in the superior court of justice; and, in 1639, counsellor in the royal chancery. He died the 3d of October, in the following year, three weeks after having undergone the operation for the stone in the bladder. As Borrichius had never been married, he left a considerable part of the large possessions he had acquired by his practice, for erecting and endowing a college for poor students in medicine. His principal medical productions consist of observations published in the Acta Hassiennia, and other similar collections, and of the letters sent by him while on his travels, to P. Bartholine, under whom he had been educated. The letters, Haller observes, are the most valuable of those published by Bartholine in his "Epitome Medici;" but the works by which he acquired his principal celebrity, were "De ortu et progressu chimiae," published in 1668, 4to.; and his "Hermetis Egyptianorum et Chemicorum sapientia, ab H. Conringio vindicata," 1674. In this very learned and elaborate work, the author defends the character of the ancient Egyptians, against the censure of Conringius: attributing to them the invention and perfection of chemistry, and even of alchemy; persuading himself that among their secrets they possessed the art of transmuting metals. But either from intemperance, or a desire of victory, he cites several manifcripts, since known to be spurious, as genuine, and some written since the time of our Saviour, as of much higher antiquity. Notwithstanding these blemishes, the works have great merit. He flew from an unbounded authority that the Egyptians were early acquainted with the medical properties of several of their plants; that they used salmone, and even mineral preparations, some of them prepared by chemistry; that incubation, or the method of hatching eggs by artificial heat, was first used by them; in fine, that the art of medicine, invented by them, passed from them to the Greeks. Borrichius was also author of "Conspicibus praedecessorum scriptorum lingae Latinae," "Cogitationes de variis lingue Latinae etatibus," "Annalæ philologicae et judiciium de lexiæ Latinae Graeciae," and various other philosophical works. Elov. Dict. Hist. Gen. Dict. and Haller's Bib. Med. Præct. where will be found the titles of the dissertations, and an analysis of the principal works.

BORROMEAN ISLANDS, in Geography, two islands situate in the bay of the lake called "Lago Maggiore," or "Lago di Locarno," in the Milanese, so denominated from their having belonged to the Borromeo family. One of these islands is called "Ifola-Bella," and the other "I sola-Madre." They are about a league distant from one another, and derive the various beautiful scenes and objects which they present from the taste and liberality of the counts Renatus and Vitalian Borromeo. They were originally barren rocks; but, with immense labour and expense, they were furnished with numerous terraces, grotoes, gar-
dens, fountains, groves of cedars, cyprises, citron-trees, orange-trees, bared, &c. which render them feenes of enchantment, and a kind of terrestrial paradises. For a particular description of them, see Keyller's Travels, vol. i. p. 374, &c.

BORROMEO, Charles, Cardinal, in Biography, the son of count Gilbert Borromee, and a fellow of pope Pius IV., was born at the castle of Arona, in 1538; and having made a considerable progress in literature, he was called to Rome on the accession of his uncle to the papal chair, in 1540, and invested with the dignities of cardinal-nephew, archbishop of Milan, and president, legate of Ancona, Bologna, and Romagna, and protector of several crowns and religious orders. At the age of 22, he was entrusted with the government of the most important affairs of the church; and he principally contributed to that encouragement of literature and patronage of learned men which distinguished this pontificate. He instituted at his house an academy, to which all the learned men at Rome repaired, when the business of the day was concluded, to discuss literary questions, and particularly such as related to sacred subjects. The works of this society have been published in several volumes, under the title of "Notae Vaticane," to denominate because its assemblies were held at night in the Vatican. In conformity to the directions of his uncle, he began his public career with great magnificence and splendour, more anxious to do honour to the pope and the rank ascribed him by his favour, than to gratify his own inclinations; but when the council of Trent filled its decrees for the reformation of clerical manners, he set an example of obedience by dismissing at once 80 domestics, discarding silk from his dress, and fasting every week on bread and water. In co-operation with the decrees of the council, he exerted himself in promoting a better education among the clergy; and with this view he instituted a number of seminaries in his own diocese, and in other places. He founded the Jesuits' college at Milan, and was eminently instrumental in erecting a magnificent edifice for the university of Bologna. He took pains in correcting the writings of some doctors of the church, which had been corrupted, and employed Achilles Statius for this purpose; and he was also active in establishing the congregation of eight cardinals, for resolving doubts and obviating difficulties that might arise in the explication of the decrees of the council of Trent. Although he was urged by his parents, and even by the pope, to prevent his family from becoming extinct by entering into a married state, he preferred remaining in the church; and notwithstanding many impediments arising from ill health, a weak voice, and defective articulation, he determined to become a preacher, and by assiduous and persevering application overcame all difficulties. After the death of his uncle, he removed to his archbishopric, and devoted himself to the duties of his pastoral office, which he performed with great honour to himself, and very much to the satisfaction and edification of the people. He took great pains in the reformation of religious orders, and in administering communion to the remotest parts of his diocese. During the plague, which afflicted the city and diocese of Milan in 1576, he continued in the scene of danger, by his presence imparted comfort to the sick and dying, and sold his goods in order to furnish himself with means for relieving their indigence and distress. He also convened several provincial councils and synods, and obtained their sanction in enacting and enforcing various useful regulations for the government of the church. His incessant labours and sufferings impaired his feeble constitution, and terminated his course of active and exemplary service at the early age of 47 years, in 1584; and pope Paul V. bestowed upon him, in 1610, the honours of canonization. Few saints in the calendar better deserve this distinction. Borromeo's writings on subjects of faith and morals were numerous; they were collected in 5 vols. fol. and printed at Milan in 1747. His "Aeta Ecclesiæ Mediolanensiæ" was published in folio, in 1510. Moroni. Nouv. Ditt. Hist. Fabr. Bibl. Græc. t. 21. p. 718. The life of Borromeo was published by Père Tournon, in 3 vols. 12mo. Paris, 1761.

BORROMINI, Francis, an Italian architect, was born in 1599, at Bifoll, in the diocese of Como, and studied sculpture first at Milan, and afterwards at Rome. Under the patronage of Maderno, his relation, who was the architect of St. Peter's, he directed his principal attention to architecture; and upon the death of Maderno in 1639, he worked under his successor Bernini; and, protected by Pope Urban VIII., he was employed about the church of S. Ignazius and the Barberini palaces. At length he became the rival of Bernini; and acquired such a degree of reputation, that the king of Spain engaged him to furnish a design for the enlargement of his palace at Rome; and though he was never excelled, he received a liberal remuneration of money, and was honoured with the order of St. James. The pope also bestowed upon him the order of Christ, and a pension. In this career of prosperity, the extravagance of his taste incurred the censure of several critics; and he was charged, by Bernini, with corrupting the sound principles of the art. The clamour against him prevailed, and his rival obtained the direction of a building for which he had prepared the designs; upon which he retired in disgust into Lombardy. On his return, he employed himself in preparing a set of grotesques for engraving; but the mortification he experienced preyed upon his spirits, and produced occasional derangement of mind; and in one of his paroxysms, he seized a sword and gave himself a mortal wound, in his 68th year. Borromini affected singularity, and indulged a capricious and fantastic taste in his designs and decorations, which was utterly insufficient with simplicity and propriety. Accordingly some have represented his style in architecture as resembling the literary style of Seneca, and of the poet Marino. Vain of his own imagined superiority, and jealous of his brethren, he declined to concur with them; and before his death, destroyed all his designs, leaving other architects should pass them off as his own. His best work, among many performances, in churches and palaces at Rome, which blend striking beauties with singularity, is accounted to be the college of the Propaganda. The oratory of the Chiefa Nova, and the house of the fathers are also admired. D'Argenville. Gen. Biog.

BORROWDALE, in Geography, a picturesque district of Cumberland, near Keswick, South of Derwent-lake, commencing at the cataract of Lowdore, and spreading its tremendous rocks in a vast sweep round the head of the lake, at the distance of about half a mile from the shore, which is bounded by meadow-land to the brink of the water. The aspect of these rocks, with the fragments that have rolled from their summits, and which lie on each side of the road, prepare the curious traveller for the awful ruin to which he approaches in the gorge or pass of Borrowdale, that opens from the centre of the amphitheatre, which bounds the head of Derwent-water. Dark rocks yawn at its entrance, and discharge a narrow pass, running up between mountains of granite, that are shattered into almost every possible form of horror. Above, the whole scene resembles the accumulations of an earthquake or volcanic eruption, splintered, shattered, and smashed in piles over one another. Huge cliffs have rolled down into the glen below, where, however, remains a miniature of the most delightful pastoral
beauty on the banks of the river Derwent. Among the most lovely of the fells are Garvan, exhibiting rock upon rock, and Egglestong, where that bed of till has lately been accenuated to build its wall; but the depredations annually committed on its young, has driven it from the place. Here the path extends for a mile over a frightful road, that climbs among the crags of a precipice that hangs over the river, with frequent glimpses into glee and chimneys, feemingly obliging farther progres by fallen flowers of rock, and at length reaching the gigantic stone of Boulder, that appears to have been pitched into the ground from the fundamant of a neighboring fell, and in its shape resembles the proof of a house revered, the side towards the road projecting about 12 feet over the base. The dimensions of this huge mass are as follow: its length is 62 feet, its perpendicular altitude 36 feet, its circumference 87 feet, and it contains 2350.5 solid feet; its weight is 1771 tons 13 hundred. The returning traveller is presented with an opening view over the Derwent lake of the Skiddaw-mountain, and the upper flees of Saddle-back obliquely seen towards the cald, and rearing itself far above all the heights of the eastern shore. At the entrance of the gorge, the village or hamlet of Grange lies picturesque on the bank of the Derwent, among meadows and woods, and shelters itself under the rumous fell, called Cattle-crag, deriving its name from the cattle or fortresses, which hom its summit once guarded this important pa. Borrowdale abounds in valuable mines, among which some are known to supply the finest waddl, or black lead to be found in England. These mountains also furnish quantities of iron-stone, slate, and various kinds of stone. Radcliffe's Journey in 1734, vol. ii. p. 53 56.

BORROWSTONNESS, or Bowness, a town of Scotland, in the county of Linlithgow, having a harbour on the south side of the frith of Forth, and surrounded with coal-pits and salt-works, which produce the principal exports of the place. It has a good pier and harbour of late construction: 15 miles W. of Leith and 4 N. of Linlithgow.

BORSALO, or Borsal, a town and kingdom of Africa, in Negroland, not far from the sea-coast, and extending along the northern bank of the river Gambia, as far as Tannaganda. The town of this name is in the middle of the country, about 45 leagues from the coast. In the country which is little known, there is a river of the same name.

BORSSELLA, in the Glos Works, an inlinement where with they extend or contrat the galleys at pleasure; also smooth and levigate them.

BORSEHOLDER. See Borough, Head.

BORSHE, in Geography, an abbey about half a league from Aix-la-Chapelle, celebrated for its mineral waters, of the same general quality with those of Aix-la-Chapelle, and recommended as warm baths in similar diseases, and also in dropsical and reedematous canes. They consist of the upper and lower springs; the lower, which supply the baths, raising the thermometer to 158°, and those of the latter to 127°. They are less plentiful than those of Aix-la-Chapelle; and abound much with felonies, which infalls the pipe through which they pass, and also the sides of the bath.

BORSIPA, or Borsita, in Ancient Geography, Semnus, a town of Babylonia, according to Josephus and Strabo; represented by the latter as consecrated to Diana and Apollo, and placed by M. d'Anville on the eastern bank of the Euphrates, about the 23rd degree of latitude.

BORSK, in Geography, a town and dioclet of Russia, in the government of Upha, seated on the river Belaya. M. lat. 50° 30'. L. long. 55° 15'.

BORSNA, or Borzna, a town and dioclet of Russia, in the government of Tchernigof, seated on a rivulet of the same name, falling into the Dniefa; 5 miles S. of Tchernigof, and 34° S. of Peterburg.

BORSOD, a town of Hungary, and the capital of a country of the same name; inhabited by Hungarians, Servants, Bohemians, and Germans, and furnishing good wine and grain.

BORSE, a small island of Denmark, 2 leagues N. E. from Aaprade, on the east coast of Skelow.

BORSHELD, in Geography, a town of Germany, in the circle of Westphalia, and bishopric of Osnabruck, 8 miles N. of Furtinae.

—also, a town of Germany, in the duchy of Holstein, 14 miles S. E. of Brambode.

BORTSTLING, in Ichthyology, synonymous with barling, or barfishing, the common perch, percus fluviatilis. See Mardgl. Danub.

BORSIE, in Zoology, the name of the badger, usius miles, in Poland. The same animal also bears the names of javextis, kubski, and sitk, in that country.

BORSZEWRA, in Geography, a town of Poland, in the palatinate of Kiov; 10 miles W. of Kiov.

BORT, a town of France, in the department of the Gorreze, and chief place of a Canton, in the diocese of Ufäß. The place contains 1752, and the canton 6503 inhabitants: the territory comprehends 140 kilometres, and 10 communes: distant 4 leagues S. E. from Ufäß.

BORTHWICK, in Topography, a parish and village in the county of Edinburgh, Scotland, is noted in the historic page for a magnificent castle which was built here by William I. lord Borthwick, about the year 1450. In its complete state it was very extensive, and considered almost impregnable, but Oliver Cromwell laid siege to it in 1650, and forced the garrison to surrender. "It is seazed," observes Mr. Pennant, "on a knowl, in the midst of a pretty vale, bounded by hills, covered with corn and woods; a most picturesque scene. It consists of a vaft square tower, 90 feet high, with square and round battlements at equal distances from its base. The flat rooms are on the first story, once accessible by a draw-bridge. Some of the apartments were very large; the hall 40 feet long, and had its music gallery; the roof lofty, and once adorned with paintings. This place was once the property of the earl of Bathwol, who, a little before the battle of Carbury hill, took refuge here with his fair consort." The parish contains 260 houses, and 665 inhabitants. Pennant's Tour in Scotland, 4to. vol. iii.

BORTZUTIM, a town of Transylvania, 12 miles N. of Claunenburg.

BORDA, a town of Portugal, in the province of Alentejo, 2 leagues from Villa Vicofa.

BORVIASA, a town of Russian Tartary, on the north side of the Don, 64 miles E.N.E. of Azof.

BORSOWY, a town of Lithuania, in the palatinate of Mind, situated on the river Berezyna, 36 miles E.N.E. of Mind. N. lat. 54° 14'. L. long. 29° 36'.

BORYSTHENES, in Ancient Geography, a river of Europe Sarmitas, forming almost the whole western boundary of Sarmatic Scythia. Its name is said to be derived from the language of the Scalli or Slaves, who, in their migration, blended themselves with the Scythians. It signifies "a rampart formed by a forex of pines," being derived from bors, a forest of pines, and pens, a wall. As a confirmation of this etymology, it is alleged that the shores of the Borysthenes are covered with forests of pines. Melas, deducting his description of this river from Herodotus, (l. iv. § 53.) represents it as flowing through a country of the same name.
name, and as the most pleasant river of Scythia, more gentle in its course than any other, and affording water more agreeable to drink. He adds, that it enriched many pleasant palaces, and that it supplied very large fishes without bones. It flowed from different and unknown springs, which lay, according to Ammianus (xxix. 5. 18) in the mountains of the Nauris, and was discharged through a course of 40 days' falling; and in this interval received many large rivers. After its junction with the Hypanis, it discharged itself into the northern part of the Euxine, now called Dnieper or Niwor, which see. — Allo, a town of European Sarmatia. Stephanus Byz. represents it as a Greek city, being a colony of Mileta, seated near the mouth of the river of the same name. By some it was called Bithynia, by its inhabitants Olba, and by Pliny Metropolis; probably the same that is now denominated Geumhun, which see.

Borza, in Geography, a town of Perus, in the province of Alettanaitza, 48 miles S. of Tauris.

Borzingkoi, a town of Siberia, on the Argua; 144 miles S. E. of Nertchint.

Bos, in Antiquity, was peculiarly used for an ancient Greek silver coin, which was didrachm, or equivalent to two drachmas.

Bos, Lambert, in Biography, an eminent philologist, was born at Wocum, in Holland, in 1672, and became Greek professor at Franeker, in the excheer of which office he acquired great reputation, and where he died in 1717. His profound erudition is honourably mentioned by several writers, and particularly by Fabricius, and by Hemsterhuis in his oration De lingua Grecce pretantis. His treatise on the Greek ellipsis is held in high estimation by grammarians. His other principal works are, "A new edition with additions, of the Greek grammar of Vitruvius," an edition of the Septuagint, with prolegomena and various readings, 2 vols. 4to. Franeker, 1709; "Thesauri Magellaeorum cum notis," "Exercitationes Philologicae," "Nouvelles lozes nonnulla illustrantur," 1709, and 1713, 8vo; "Myth. Elliptici Graeci expositi specimen," "Antiquitatum Graecarum distinctio," and "Animadversiones ad editiones quasdam Græcorum." Nouv. Dic. Hist.

Bos, John Baptist Du, the son of a confederable merchant and magistrate of Beaurvais, in France, was born at that place in 1670, and finished his studies at the Sorbonne. He afterwards became a distinguished writer, and a member of the French academy. In 1699 he was one of the committees for foreign affairs under Mr. Torey, and was afterwards charged with some important transactions in Germany, Italy, England, and Holland. After his return to Paris, he was made an abbé, and had a pension. He was also chosen perpetual secretary of the French academy, and in this situation he died at Paris, March 23, 1743. His principal works are, "Critical reflections upon poetry and painting," of which the best edition is that of Paris, 1700, 3 vols. 12mo. "A critical history of the establishment of the French monarchy among the Celts," of which the best editions are those of 1713, in 2 vols. 4to., and in 4 vols. 12mo.; "The history of England ill understood in the present war," 1714; "The history of the four Gordians, confirmed and illustrated by medals," and "The history of the league of Cambrai, formed in 1708, against the republic of Venice," of which the best edition is that of 1728, in 4 vols. 8vo.

Bos, or Bosche, Jeron, an ancient painter and engraver, was born at Bois-le-Duc, and took pleasure in painting devils, witches, and enchantments. His pictures, distinguished by the freedom of his touch, and the strength of his colouring, are held in high estimation, though, from the nature of the subjects which he selected, they excite a degree of horror blended with admiration. The most remarkable painting of this master, among several others of a similar kind, in which he indulges a wildness of imagination, is an allegory of the pleasures of the field; representing the principal figure, drawn by monstrosous imaginary forms, preceded by demons, and followed by death. He was also an engraver, and the first artist who attempted to engrave in the grotesque style; and he is said to have been more distinguished by fertility of invention than by a correct judgment. The two plates, most deserving of mention, are one representing St. Christopher, carrying the infant Jesus across the water and bending under his load; on the left is a hermit, coming from his cell with a hearth, and the whole composition is surrounded with small grotesque figures of all shapes, in the most ridiculous attitudes; and another is the "Laid judgment," in which Christ appears seated on a rainbow, with two angels on each side and sounding trumpets, having on their labels this inscription, "The eye dies queen fest;" "forgive mortals, virtue ad judicium," and at the bottom are small figures of men and devils of all shapes intermixed. To both these prints is affixed his name, "Bosche." He died in 1560. Pilkington and Strutt.

Bos, John Lewis, or John Lewis de, a painter, was born at Bois-le-Duc, and having received instructions in painting from the artists of his native city, he applied himself to study after nature, and became eminent for the truth of his colouring, and the neatness of his handling. His favourite subjects were flowers and curious plants, which he grouped in vases of glass or crystal, half filled with water, and to which he gave a peculiarly natural and pleasing appearance. He also exhibited on the leaves of his subjects the drops of dew with singular transparency, and embellished them with butterflies, bees, wasps, and other insects, in a manner superior to that of any co-temporary artists. In the style of his portraits he was no less excellent than in his composition of still life. He died in 1597. Pilkington.

Bos, in Zoology, the Ox, a genus of animals in which the horns are concave, or hollow, turned outwards, large and smooth; front teeth in the lower jaw eight; canine teeth or tusks none.

There are but few species of this tribe that appear to be really domestic; but the number of varieties into which they are divided, arising from the differences of climate, domestication, and other causes, are countless. They are a most valuable race of animals to mankind, their flesh and milk affording excellent nourishment; and, being useful as beasts of burden, and their hides serve many domestic purposes. The species are Taurus, or the common ox, which comprehends the varieties of forms and domesticus, Americanus, moschatus, graminivorus, and burmi, according to Gmelin. To these are added, by later writers, the Bovus of Kerr; the Bovus of Aristotle, and the Bovus of Africa, under the names of Bos Barbatus, and Pamiss, which see.

Bos, Henry, Aldrovanus, see Strepsiceros bos.

Bosa, in Geography, a maritime and episcopal town of Sardinia, situated on the western coast of the island, near a river of the same name. It is defended by a castle, and has a good port; distant 18 miles S. W. from Algieri, and 86 S. S. W. of Saffuri, to which it is suffragan. N. lat. 40° 18'. E. long. 8° 34'.

Bosara, in Ancient Geography, a town of Arabia Felix, according to Prolemy.

Bosaraddaba, or Jesarbecca, a town of Asia, in the province of Sabletan; 21 leagues S. of Canthalar.
BOSSOCK, Bosse, Bosse des Bois, and Forest
Antelope, in Zoology, the name of Antelope Sylvatica
(Gazell.) by different writers. See Sylvaticus.

BOCCIO, CLAUDIO, in Biography, an engraver, was a
native of France, and being invited to England by Nicholas
Dorigny, assisted him for some time in engraving the
carvings of Raphael; and afterwards separating from Dorigny,
he undertook to engrave the caricatures for the printmakers.
He also engraved the duke of Marlborough's battles, for
which he received 30l. per plate; and, assisted by Du
Guernier, and afterwards by Beaumes and Baron, he com-
pleted them within two years in 1717. He then became
a print-maker, and published, by subscription, the transla-
tions of Pecant's Religious Ceremonies. As an engraver he pos-
sessed no great merit; his style is coarse and heavy, and the
drawing of the naked parts of the figure in his plates is very
defective. However, he engraved from several great masters.

The "Continence of Scipio," from a picture of Nicholas
Poussin, in the Houghton collection, is one of his plates. He
expired in 1774. Strutt.

Bocce, PIERRE DU, an eminent protestant preacher of
France, was born at Bayeux in 1623, educated at Montau-
ban and Saumur, and in 1645 ordained one of the ministers
of Caen. The fame of his eloquence was very extensive; and
he was warmly solicited by the churches of Chartres and
Paris to become their pastor, but he preferred continuing at
Caen. His reputation excited curiosity and alarm; and he was
falsely charged with having used offensive language with
regard to auricular confession, and on this charge exiled to
Chalons. But his talents and character were held in such
high estimation, that powerful intercession was made in his
favour, so that he was permitted to return in the same year,
1654, to Caen. His return was the occasion of very general
rejoicing among persons of all parties; and it was celebrated
in a very singular manner by a Catholic of free character,
who invited two Franciscans to an entertainment, and urged
and linking to such a degree, that one of them died on the
spot. Next day he paid his respects to M. Du Bocé, and in-
formed him, "that he had thought it his duty to sacrifice a
monk to the public joy; that the offering would have been
more suitable if it had been a Jesuit, but he hoped it would
not be unacceptable, though only a Franciscan." M. Du
Bocé was selected, on account of his distinguished character
and address, to draw up remonstrances against the severities
which were exercised by the Catholics against the Prote-
stants; and on all occasions he expressed his loyalty to the
king, and such a disposition to submit to civil authority, that
he frequently succeeded in obtaining relief, and in checking
the rage of persecution. At length, however, viz. in 1667,
the violence of the adversaries of the Protestants became
irrefrangible, and the parliament of Normandy inflicted an
arrest, which prohibited Du Bocé from the exercise of his
ministry. Upon this he retired to Holland, and discharged the
duties of his ministerial office at Rotterdam, till his death,
which happened in 1692. During his life he printed two volumes
of sermons; and after his death, his post-in-law, M. le Gendre,
published a collection of public papers, speeches, letters on
theological subjects, Greek, Latin, and French verses, &c.

GEN. DIČ.

bank of Merrimack river, above Concord; 43 miles N.W. from Exeter. It contains 1108 inhabitants; and in its vicinity are the Boscawen hills.

BOSCAWEN'S ISLAND, a name given by captain Wallis, in 1767, to an island in the Southern Pacific Ocean; called by the natives "Kootah." It is separated from Keppel's island, called "Neootaabooaboo," by a channel 3 miles broad. They are both situated in S. lat. 17° 55'. W. long. 173° 48'. Kootah is very lofty, of a conical form, between two and three miles in diameter, and lies N.E. from the other. Both are populous and fertile. They were discovered by Schouten and le Maire, May 10, 1616. Schouten, who, after bartering with the natives for cocoa-nuts, in return for nails and beads, was attacked by them from their canoes, called them 'Traitors' and Cocoa islands, in consequence of the reception he met with. Captain Wallis exchanged with the inhabitants of Neootaabooaboo some bowls for fowls, fruit, and one of their clubs. Perouse saw Kootah Dec. 20, 1787, and having examined both the islands, lay in a bay upon the west coast of the larger division of Neootaabooaboo. The natives brought off the finest cocoa nuts he had ever seen, with other vegetables, as well as some fowls and a hog; they seemed to manifest no apprehension, and traded very freely. They resembled the more southern islanders in every thing, except that their looks indicated a ferocity, like that which characterizes their northern neighbours. A rocky bank, two or three leagues N. of Kootah, was found in 1616, covered with 14 fathoms of water. Missionary Voyage, Intro. p. 67.

BOSCH, BALTHASAR Vanden, in Biogrophy, a painter of conversations and portraits, was born at Antwerp in 1675, and first studied, after the manner of Teniers, those subjects which were apartments decorated with bullys, vases, pictures, and other curiosities; but in process of time he employed his pencil on subjects of a more elegant and elevated kind, and acquired a superior style of performance. He also painted portraits with great reputation, and particularly a portrait of the duke of Marlborough on a horse, painted by Van Bloemen. His paintings fetched an extravagant price, exceeding that produced by the performances of Teniers or Oiade, with which they cannot, in reality, pretend to any competition. His pencil is light, his touch spirited, and his figures, more elegant than those of most of his contemporaries, are drest in the mode of the time. In some of his works the composition and design, and also the colouring, are very good, and the subjects are judiciously chosen. He died in 1715. Pilkington.

BOSCH, JACOB Vanden, a painter of still life, was born at Amsterdam in 1636, and painted summer fruits of various kinds with a neat pencil, and with such an exact imitation of nature, that they appeared delicious, and almost real. He died in 1676. Pilkington.

BOSCHADIS, in Zoology, a species of Echinorhynchus, that infests the intestines of the domestic duck. The neck is filiform, and the proboscis slightly extended.

Goeze Essayw.

BOSCHAS, Anas Bofchas, in Ornithology, the Common Mallard, or Wild Duck, the specific distinction of which consists in the plumage being of a cinereous colour; the tail feathers (of the male) recurvate; bill straight; collar white. Lin. Fu. Suec. &c.

Gmelin mentions several distinct varieties of this bird, in the Syl. Nat. the characters of which are described as follows:—Cirrhata, above grey, beneath white, crec' cinereous; pericea, head and upper parts of the neck cinereous, beneath yellowish; major, back footy. This is larger than the others, measuring two feet and a half in length. Grijsa, entirely cinereous, with the legs and bill black; nivea, with the back black, spotted with yellowish; nigra, having the head and collar black.

The natural history of the wild duck is detailed so amply by different writers, that nothing new remains to be added by us. Dr. Latham, in particular, has entered at great length in his judicious compilation on this subject. The wild ducks, observes the writer, are frequent in many parts of England, but no where in more plenty than in Lincolnshire, where prodigious numbers, according to Mr. Pennant, are taken annually in the decoys, each decoy paying for five pounds to twenty, annual rent. In Somersetshire the rental of a decoy yearly has been known to amount to even thirty pounds.

With us these birds pair in the spring. They breed in all the low marshy grounds, laying from ten to fifteen eggs. It is observed of the young, that they always take to the water as soon as they are hatched. The old birds are very artful. They do not constantly build their nest close to the water, but many times at a distance from it; in which case the female takes little breadth in its beak, or between its legs, one or two at a time, to the water side, and going into it herself, the young ones follow instinctively. Wild ducks are known sometimes to lay the eggs in a high tree, in the deserted nest of a crow, or a magpie. Dr. Latham speaks of an instance that took place at Etchingham, in Sussex, in which the female was found sitting upon nine eggs, in an oak twenty-five feet from the ground. The eggs were supported by some small twigs laid crossways.

In England only a comparatively small number of wild ducks are found in the summer; because, at that time, they remain in the more northern parts of Europe, and only return to us towards the winter. In France this species is not often seen till the winter; appearing in October, and again departing northward in the spring. They are caught in that country, as with us, in decoys, the chief of which are in Picardy, where prodigious numbers are taken, especially on the river Somme. They have also another method: a sportsman, with a cage of tame decoy ducks, takes his station in a certain place, near which is a concave, the flock will pass. If they approach so near as to allow him to fire, he takes them with little trouble; but if otherwise, he lets fly one of the tame decoy ducks, then a second, and so on: these tame birds entice the wild ducks in small parties within reach of the sportsman's fowling-piece, who is thus enabled to kill six or seven birds at every shot. They are now and then taken also by means of a hook, baited with a bit of sheep's lights, which, swimming on the water, the bird swallows the bait, and hook with it. Divers other methods of catching the wild duck are peculiar to different nations, of which one seems worth mentioning, on account of its singularity; and this is the practice in India. The perfon wishing to take these, wades into the water up to the chin, and having his head covered with an empty calabash, approaches the place where the ducks are; when they, not regarding an object of this sort, suffer the man freely to mix with the flock; after which he has only to pull them by the leg under the water, one after another, till he is satisfied; returning as unsuspected by the remainder as when he first came among them. This mode of capture is common on the river Ganges, only that the duck-hunters use the earthen vessels of the gentoes, instead of calabashes. These vessels are what the gentoes boil their rice in, and are called kutchare pots, which, after being once used, they look upon as defiled, and in consequence throw them into
the river as useful. The ducks, from constantly seeing
the fish float down the stream, regard them as little as
the corks, and the duck hunter, concealing his head
more of them, can seize upon them without exciting
the least suspicion. A similar method is also practiced in China,
and in South America, to take the wild duck.

**Bosch**. _Amur fera five Boschian museum_. Brit. A
ferna is Alm Clyspecta, the Shoelover, var. 2. See

**Boschi, Boeschi, or Bosch, in Geography, a town
of Italy, in the Province of the Milanese, seated on the
river Oltre, five miles E. from Alexandria.

**Boscia, in Botany, (in honour of Bosc, author of part
of the Zoological and Botanical articles in " Nouveau Die-
trie de l'histoire naturelle," now publishing at Paris)
Musken, 266. Clasf, _tecssulbro trigylata_. Gen. _Call.
perianthus_, four-toothed. _Cor._ four-petalled. _Pericarp._
cells, four-celled.

Species B. _pedulata_, Thunberg, " Leaves opposite, lanceo-
late, wavy." A shrub. Native of the Cape of Good
Hope.

**Boscia.** _La Mark_ (Izlaft. P1. 395) _Clad, dodecandra
magigia_. Gen. _Call._ _Col._ perianthus, four-leaved. _Cor.
none. Stem. filaments long; anthersdidymous. _Pfl._ germ
on a pedicle, as long as the filaments; _tile_, none; _ stigma_
pointe. _Pericarp._ a nut. _Seed._ one.

Species B. A shrub. _Leaves_, oblong-ovate, alternate,
on short petioles, strongly reticulated, coriaceous. Flowers
in a terminating corymbus. A native of Africa, in the
neighbourhood of Gorce, where the negroes cut the kernel
of the nut. This plant does not appear to be known
at Willenow. It will, doubtless, soon receive another name,
as Thunberg's plant seems to have got the first publication.

**Boschius, John, in Biography, a native of Liece-
of considerable learning and abilities, was invited, in 1538,
to the chair of professor of medicine, at Ingolstadt, which
he held with credit several years. His works are, "De
perle liber," published originally in German, in 1502, 4to;
"Concordia philosphorum, ac medicorum, de humano
corpus, atque factus incremento, animato, mora in
utero, ac nativitate." Ingol. 1576, 4to. and 1588;
"Oratio de optimo medico, et medicorum, inter-
curationes Ingolssarifensies." Haller Bib. Amat.

**Bosco, in Louis. See Attaccamenta de bosco et
spinis.**

**Bosco bel, in Topography, in the parish of Donnington,
in Shropshire, is a place memorable in English history, for
the oak tree, wherein King Charles the Second secreted
himself, after the desperate battle at Worcester. Finding
it impracticable either to escape into Wales, or to reach
the metropolis, in safety, and knowing that many of his enemies
were searching for him, in the immediate neighbourhood, he
was prevailed on by Major Carls (who accompanied him)
to seek protection in a large oak tree. Here they feasted
themselves one whole day, and saw some of Cromwell's
soldiers seeking for the king in an adjoining wood. After
the restoration, this tree became highly venerable, and nu-
merous persons went on pilgrimage to see it. A great part
of it was cut away, and converted into tobacco rollers,
books of leaves, and other memorials; and many plants
were propagated from its stumps. Its remains are inclosed
with a brick wall, the inside of which is covered with laurel.
The 29th of May, the day of his birth, and of his resto-
ration, is still commemorated in England, by an annual
festival and holiday; and various effigies of the commu-
nity display branches, leaves, and apples of the oak tree.

Near Boscobel is Whitechurch. So named from being a nun-
con of white, or Cistercian nuns. The ruins of this are still
considerable, and the church is ornamented with circular
_Carte's History of England, vol. iv._ Granger's

**Bosco, or Bosci, in Ecclesiastical History, denotes
a species or tribe of monks in Palestine, who fed on grass,
like the beasts of the field.

The word is Greek, _bosco, e. d. greets_; formed from
_bosco, pso, f. feed._

The Boscoi are ranked among the number of Adamites,
not so much on account of their habit as food. They took
no care about provision; but when eating-time came, or any
of them were hungry, went into the fields, with each his
knife in his hand, and gathered and ate what he could find.

**Boscoli, Andrea, in Biography, an historical painter,
was born at Florence, in 1553, and educated under Santì di
Titi. He was the first person who had a just notion of the
chiaro-scuro, and used it successfully in the Florentine
school; where, though it had been happily practised by
Giorgione, at Venice, and also by Titian, it was not well
understood before his time. He possessed great freedom of
hand, and gave a surprizing force of colour; and both in
dignity and composition the grandeur of his style resembled
that of his master. He studied after nature; and in his
travels he drew sketches of any particular objects that struck
him; but pursuing this practice at Loretto, with regard to
the fortifications of the city, he was seized by the officers
of justice, and confined to be hanged; but he happily
e沈aped, within a few hours of execution, by the interposition
of Signior Baudini, who explained to the chief magistrate
his innocent intention. He was also an engraver; but the
subj ects of his plates are not specified either by Marcolis
or loreau le Camer. He died in 1606. Pilkington.

**Boscovich, Roger Joseph, an eminent mathematician
and natural philosopher, was born of very respectable
parents, in the free city of Ragusa, on the coast of Dalmatia,
the 18th of May, 1711. He was the youngest of nine
children, and his mother lived to the extraordinary age of
103. Six years received the boy education that their father's
circumstances could afford; and all of them, particularly the
decl, who became a priest, were distinguished by a happy
vein for poetry. Having finished his grammatical course
with applause, the young Boscovich, prompted by the
example of his brother, in his fifteenth year took the habit
of the noviciate, and entered the Jesuits' College at Rome.
There the original bent of his genius discovered itself, by
the enthralling a door with which he plunged into the
study of the mathematics. His progress in that important
branch of knowledge was so rapid as to astonish, and soon
outrun his preceptors. Under their instruction he acquired
the elements of geometry and algebra, but was left to the
exercise of his own application in perfecting the higher
parts of mathematics. He studied by himself the principles
of the differential calculus; and thus prepared, he began the
Principia of Newton, and devoted that immortal work with
the most eager avidity. He was transported by the vast
display of new and splendid truths which were unveiled;
and while, with the torch of geometry, in traced the secret
links of nature's operations, and seemed to penetrate the
concealed of heaven, he felt his passion for instruction won-
derfully inflamed; nor, in the warmth of his temper, could
he
he suppresses the movements of self-gratulation, which the
con fists of his powers and acquisitions excited in his
breath. By his persuasion, Noceti, his master in philosophy,
was induced to print a small poem on the rainbow, and
another on the aurora borealis, both of which Boscovich
enriched with ingenious notes and illustrations. The
publication of this tract spread his fame beyond the precincts
of the college, and beyond the Alps. Mairan, whose opinion
concerning the aurora borealis he had criticized, noticed it
with loud commendation, in the second edition of his
dissertation; and the praises bestowed by the French philosopher,
with the title conferred on him of correspondent of the
Academy of Sciences, could not fail to prove highly grati-
fying to his youthful vanity.

After Boscovich had completed the usual course of phil-
osophy, he was obliged, by the rules of the institution, to
 teach grammar and the classics; but he never lost sight of his
favorite studies, and he was invited by his mathematical
master, to defend annual theses, and deliver public diller-
tations on such subjects as occasion suggested. Thence he
was printed in succession, extended further his reputation. The
first appeared in 1736, and contained a theory of the solar
spots, very similar to that which was afterwards so ingen-
iously supported by professor Willon, of Glasgow. It
supsup the fan to have two atmospheres, the lower being
dense, and sometimes sprinkled with clouds; the upper, rare,
and subject to variation of height. Next year produced
two dissertations; one on the transit of Mercury, and ano-
other on a remarkable aurora borealis.

Five years had Boscovich spent in the drudgery of teach-
ing Latin, and three more were consumed in the unprofitable
study of scholastic theology, when, by a very singular indu-
gence, he was exempted by his superiors from the fourth
year's attendance, and permitted to relinquish that dark and
thorny path, and thenceforth employ his talents in exploring
Nature's wide domain. His situation now, as supernu-
merary preifet of the Roman College, was entirely suited to
his taste. To communicate mathematical instruction was
him a delightful task; and he prepared, for the use of his
pupils, a short syllabus of geometry, which comprised all
the capital truths of that science in fourteen propositions.
In the selection of the materials, in their disposition and
arrangement, he exhibited the clearness, the precision, and
noble elegance, formed after the model of the ancients. He
composed the elements of trigonometry with the same purity
of taste. But the capital part of the syllabus, his theory of
the Conic Sections, was reared by repeated efforts, and at
difficult intervals, and was not published until the year 1755.
Boscovich considered these curves as described in plane,
and applied, for his generic definition, the beautiful pro-
ducts of the directrix, which is common to them all, the
parabola being only its simplest case. In the ellipse, the ratio
of a line, drawn from any point to either of the foci, is to a
perpendicular from the same point to the directrix, in the
ratio of a less to a greater; in the hyperbola, it is that of a
greater to a less. But the author did not stop here; he
likewise investigated the properties derived immediately from
the section of the cone. He supposed it cut by a movable
plane, and showed how the former curve would hence be
successively produced. The same luminous idea he trans-
ferred to the cylinder, the spheroid, and the conoids. His
imagination loved to contemplate the fine mutation and
transition of mathematical figure, and to trace the series of
successive, yet apparently connected changes, which have
suggested the law of continuity. On that metaphysical prin-
ciple, as elucidated by the transformation of geometrical
bfa, he gave an exquisite dissertation. Other dissertations,
remarkable for their ingenuity, were incessantly delivered
to a crowded audience, at the annual examination of his
school. These treated on various difficult points in geom-
etry, astronomy, and optics; on calculating circles, the nature
of infinitesimals, trajectories, the inequality of gravity over
the earth's surface, the centre of magnitude, the laws of
bodies, living forces, the flux and reflux of the sea, the
annual aberration of the fixed stars, the limits of astronomic
observations, the use of lenses and dioptric telescopes, and a
new method of employing the observation of the phases in
lunar eclipses, on the determination of a planet's orbit, by
help of catoptrics, and on the atmosphere of the moon,
which he held to be very different from that of the earth,
and more analogous to water. In one of these dissertations
he pointed out a mistake of the famous Daniel Bernouilli,
who had hastily concluded, that the tides of the atmosphere
must rise higher, in proportion to his rarity, than those of
the ocean; in another, he shewed that the question, con-
cerning the measure of forces, which then so vehemently
agitated the scientific world, as it generally happens, was
merely a dispute of words; in a third, he sketched the out-
lines of that bold structure, which has obtained such deserved
celebrity among the learned—his sublime theory of the con-
stitution of matter.

While Boscovich was thus usefully and honorably en-
gaged in directing the studies of youth, and enlightening
the learned world by his elegant and ingenious writings, the
pleasure of his conversation was eagerly courted at Rome.
In every house of note he was always a most welcome guest,
and he reigned in every society by the ascendancy of his
talents. Before mixed companies he would freely talk of
his own speculations, which he had a singular felicity in
rendering intelligible and interesting to the most ordinary
minds; and though, on these occasions, he was not accome-
tioned to conceal his inward satisfaction, or decline bellowing
upon himself the merited encomiums, the frequent fables
of vanity seemed to flow merely from the warmth of his
character, and were effaced in the general blaze of admiration
entertained for his superior talents. Nor was it his ambition
confined within the circle of abstract science; indulging the
excursive flights of fancy, he often sacrificed to the Muses.
He composed Latin verses, on a great variety of subjects,
and which consequently posses still very different degrees of
merit. Every occurrence he was ready to seize, whether
public or private, serious or comic; wars, mutinies, jocular
and domeslic incidents, were all indifferently his theme.
He had a wonderful knack in composing those verses, with
a memory not less astonishing for retaining them; and at the
tables of his friends he took pleasure in reciting elaborate
passages. Surrounded by his disciples and partial admirers,
the sort of idolatry which he received appears, however,
to have had rather an unfortunate effect on his character, by
tempting him to overrate the measure of his powers, and
extent of his attainments. Once, and once only, he entered
the lists with his illustrious contemporaries. It was in an-
swer to the question, proposed by the Academy of Sciences
at Paris, to determine the inequalities produced by the
mutual action of Jupiter and Saturn, especially near the time
of the conjunction. His memoir was returned with much
commendation, and very few mathematicians affumed would
have felt themselves lowered, yielding the preference to the
great Euler. But Boscovich was piqued at what he con-
ceived to be an unfair decision, and would never afterwards
engage in any public competition.

A philosopher, residing in Rome, amid the venerable
remains of ancient splendor, was powerfully drawn to exa-
mine those monuments. Boscovich wrote several disserta-
tions.
BOS

considerations on the subject of antiquities, two of which were printed, and the rest circulated in manuscript. His zeal, activity, and fondness of applause, rendered him at all times accessible, and in a multitude of cases, his advice was ardently sought by individuals. Benedict XIV, a great patron of learned men, and his enlightened minister, cardinal Valenti, consulted him on various important objects of public economy, the clearing of harbours, and the constructing of roads and canals. On one occasion, he was joined in a commission with other mathematicians and architects, invited from different parts of Italy, to inspect the cupola of St. Peter's, in which a crack had been discovered. They were divided in opinion; but the sentiments of Boscovich, and of the Marquis Poleni, prevailed. In dating, however, the result of the consultation, which was to apply a circle of iron round the building, Poleni forgot to refer the idea to its real author, and this omission grievously offended the Raguini geometer. Other incidents had occurred to mortify his pride: he became at last dissatisfied with his situation, and only looked for a convenient opportunity of quitting Rome. While in this temper of mind, an application was made by the court of Portugal to the general of the Jesuits, for ten mathematicians of the faculty to go out to Brazil, for the purpose of surveying that settlement, and ascertaining the boundaries which divide it from the Spanish dominions in America. Willing to combine with that object the munificence of a degree of latitude, Boscovich offered to embark in the expedition, and his proposition was readily accepted. But cardinal Valenti, unwilling to forego the honour reflected by a man of such distinguished abilities, commanded him, in the name of the pope, to dismiss the project, and persuaded him to undertake the same service at home in the Papal territory. In this fatiguing, and often perilous operation, he was aided by the English Jesuit, Mayer, an excellent mathematician, and was amply provided with the requisite instruments and attendants. They began the work about the close of the year 1759, in the neighbourhood of Rome, and extended the meridian line northwards, across the chain of the Appenines as far as Rimini. Two whole years were spent in completing the various measurements, which were performed with the most scrupulous accuracy. In the intervals, while this great work was carrying on, the active disposition of Boscovich sought amusement and occupation in other pursuits. At night he was busy in drawing out his Elements of Conic Sections; and in the mornings and evenings, during his excursions to and from the remote stations along the mountains, he composed on horseback the greater part of his elegant Latin poem on eclipses. This singular fact reminds us of what is reported of the late Dr. Darwin, who is said to have framed, in his mind, the beautiful and harmonious episodes of the Botanic Garden, while driving in his chariot, on visits to his country patients.

This important operation of measuring two degrees on the surface of Italy, is elaborately described by Boscovich, in a quarto volume, written in his usual diffuse manner, and full of illustration and minute details. But the book is rendered the more valuable by the addition of several epistles, or detached essays, relating to the subject, and which display great ingenuity, conjured with the finest geometric taste. We may instance, in particular, the discourse on the rectification of instruments, the elegant synthetical investigation of the figure of the earth, deduced both from the law of attraction and from the actual measurement of degrees, and the nice remarks concerning the curve and the conditions of permanent stability. This last tract gave occasion, however, to some criticisms from D'Alembert, to which Boscovich replied, in a note annexed to the French edition of his works.

The arduous service which Boscovich had now performed was not poorly rewarded. From the pope he received only a hundred scudi, or about forty-five pounds sterling, a gold box, and abundance of praise. He now resumed the charge of the mathematical school, and besides discharging faithfully the public duties of religion, which are enjoined his order. A trifling circumstance will mark the warmth of his temper, and his love of precedence. He had recourse to the authority of cardinal Valenti, to obtain admission into the oratory of Caravita, from which his absence excluded him, and which yet did afford only the benefit of a free, but frugal supper. In prefixing at that social repast, the philosopher relaxed from the severity of his studies, and shone by his varied, his lively, and fluent conversation. He lived in habits of intimacy with his colleagues, and especially with his compatriot, Benedict Stay, known to the learned world by an excellent didactic poem, entitled "Philosophia Recepta," and which he elucidated by notes, containing, in a very neat compressed form, the elements of mechanics.

At this time a dispute arose between the little republic of Lucca, and the government of Tuscany, on the subject of draining a lake. A congress of mathematicians was called, and Boscovich repaired to the scene of contention, in order to defend the rights of the petty state. Having waited three months in vain, expecting the commissioners, and annulling with repeated hollow promises, he thought it better for the interest of his constituents, to proceed at once to the court of Vienna, which then supremely directed the affairs of Italy. The flames of war had been recently kindled on the continent of Europe, and Boscovich, like a true courtier, took occasion to celebrate the first successes of the Austrian arms, in a poem, of which the first book was presented to the Empress Theresa; but the military genius of Frederick the Great of Prussia soon turned the scale of fortune, and our poet was reduced to silence. More honourably did he employ some leisure in the composition of his immortal work, "Theoria philosophorum naturalis reducita ad unicum legem virium in natura existentium," printed at Vienna, in the year 1758.

This he drew up, as it is alleged, in the very short space of thirty days, having collected the materials a considerable time before; yet we must regret the appearance of haste and disorder, which deforms a production of such rare and intrinsic excellence.

After a successful visit of eleven months at Vienna, Boscovich returned to Rome, and received from the senate of Lucca, for his zealous services, the handsonmepresent of a thousand scudi, or about £450. Thus provided with the means of gratifying his curiosity, he defied and obtained leave to travel. At Paris he spent six months, in the society of the eminent men, who then adorned the French capital; and, during his stay in London, he was elected, in 1760, a fellow of the Royal Society, and he dedicated to that learned body his poem on eclipses, which contains a neat compendium of astronomy. The expectation of the scientific world was then turned to the transit of Venus, calculated to happen in the following year. Boscovich, eager to observe it, returned through Holland and Flanders to Italy, and joined his illustrious friend, Correr, at Venice, from whence they failed to Constantinople, having, on their way, visited the famous plain of Troy. In Turkey, he severely enjoyed one day of good health, and his life was repeatedly depairied of by the physicians. After spending half a year in this miferable state, he returned in the train of Sir James Porter, our ambassdor at the Porte; and having traversed Bulgaria, Moldavia, and part of Poland, his intention was to penetrate...
into Russia, if the agitation which there prevailed, on the
ruddled death of Peter, had not deterred him from executing
the project. The diary of his journey, which he published
in Italian and French, is but a poor book, full of pedantry,
and patched up of trifling and invidious remarks. Yet such
were his pride and blind partiality, that he regarded, with
contempt, the whole of his critics to which it gave occasion.
Bocovich began his travels at too late a period of
life to profit much by them.

At Rome his arrival was welcomed, and he was again
consulted on various plans of public improvement. But in
the spring of 1764, he was called by the Austrian governor
of Milan, to fill the mathematical chair in the university of
Pavia. The honours which he received provoked the jeal-
ousy of the other professors, who intrigued to undermine
his fame. He took the most effectual measures, however, to
silence them, by publishing his dissertations on optics, which
exhibit an elegant synthesis and well-arranged set of experi-
ments. These essays excited the more attention, as, at this
time, the ingenuity of men of science was particularly
attracted to the subject, by Dollond's valuable discovery of
achromatic glases.

The expulsion of the Jesuits from the dominions of
Spain prevented Bocovich from going to California, to
observe the second transit of Venus, in 1769, and which
expedition the Royal Society of London had strongly solicited
him to undertake. And as his rivals began now to
flir themselves again, he fought to dispel the chagrin, by a
second journey into France and the Netherlands. At Brus-
seels he met with a peasant, famous for curing the gout, and
from whose singular skill he received most essential benefit.
On his return to Italy, he was transferred from the univer-
sity of Pavia to the palatine schools at Milan, and refi{ed
with those of his order, at the college of Brera, where he
performed, mostly at his own expense, an observatory, of
which he got the direction. But he was still doomed to
experience mortification. Some young Jesuits, who acted
as his assistants, formed a conspiracy, and, by their artful
representations, prevailed with the government to exclude
his favourite pupil and friend from holding a charge of trust.
This intelligence was communicated to him at his baths of
Albano, and filled him with grief and indignation. He com-
plained to prince Kaminz, but implored his protection in
vain. To the governor of Milan he wrote, that he would
not return, unless things were reformed to their former foot-
ing. He retired to Venice, where, having passed ten months
in fruitless expectations of obtaining redress, he meditated
spending the remainder of his days in honourable retirement
at his native city of Ragusa. But while he waited for the
opportunity of a vellit to convey him thither, he received
the affecting news of the suppression of his order in Italy.
He renounced his scheme, and seemed quite uncertain what
step he should take. Having come into the Tuscan territory,
he listened to the counsels and solicitations of Fabroni, who
held forth the prospect of a handsome appointment in the
Lycceum of Pisa. In the mean time he accepted the invita-
tion of La Bord, chamberlain to Louis XV. and accompanied
him to Paris. Through the influence of that favourite, he
obtained the most liberal patronage from the French mon-
arch; he was naturalized, received two pensions, amount-
ing to 8000 liras, or £1333, and had an office expressly
created for him, with the title of "Director of optics for the
marine." Bocovich might now appear to have attained the
pinnacle of fortune and glory; but Paris was no longer for
him the theatre of applause, and his ardent temper became
foured by the malign breath of jealousy and neglect. Such
extraordinary favour bestowed on a foreigner, could not fail
to excite the envy of the servants, who considered him as
rewarded greatly beyond his true merit. The freedom of
his language gave offence, his perpetual egotism became
disgusting, and his repetition of barbarous Latin epigrams
was most grateful to Parisian ears. Besides, the name of a
priest and a Jesuit did not command respect; and the leniency
of autotory devotion, which he publicly professed,
had grown unfashionable, and were regarded as fiercely be-
fitting the character of a philosopher. Mirabeau, in his let-
ters from Prussia, mentions Bocovich with a degree of flight
bordering on contempt, and warmly recommends it to his
court to invite from Berlin the celebrated Lagrange, a ma-
thematician of the very highest order, and blest with the
mildest disposition.

But the geometry of Ragusa was not idle. He applied
attentively to the improvement of almanac and optics; and
his diligence was evinced by a series of valuable memoirs.
He revised and extended his former ideas, and struck out
new paths of discovery. His solution of the problem to de-
termine the orbit of a comet from three observations, is re-
markable for its elegant simplicity; being derived from the
more elementary principles of trigonometry. Not less beau-
tiful are his memoirs on the micrometer, and on achromatic
telescopes. But his situation had become extremely irksome;
and in 1783, he decided and obtained leave of absence. Two
years he spent at Baffano, in the Venetian state, where he
published his opuscules, in five volumes, 4to. composed in
Latin, Italian, and French, and containing a variety of
elegant and ingenious disquisitions connected with almanacal
and optical science. During that time he lived with his ed-
tor Remondini, and occupied himself in superintending the
pres. After finishing his task, he came to Tuscany, and
passed some months at the convent of Valombroa. Thence
he went to Milan, and infused a Latin prospectus, in which
he proposed to reprint the philosophical poem of Stay, en-
riched with his annotations, and extended to ten books.
But very few subscribers appeared; his opuscules experi-
ced a slow sale; and the imperial minister neither consulted
nor employed him in some mathematical operations which
were carrying on. Every thing but too keenly reminded
him that he was no more a favourite of the Italian public.
The vifions of glory melted away. This mortifying reflexion
preyed upon his spirit, and made the deeper impression,
as his health was much disordered by an inflammation of
the lungs. He sunk into a stupid, listless melancholy, and after
brooding many days, he emerged into a childlike infancy,
and at last became furiously mad. It was truly pitiable to
behold a man of his eminent talents reduced to such an hu-
miliating condition. The Milanese government provided
for his custody. During the heat of delirium, he frequently
exclaimed, that he would die poor and inglorious. His
religious feelings acquired new force, and he seemed to look
forward with anxious hope for that distinction in a future
world, which he thought was unjustly denied him in this
crowded state of existence. In his short lucid moments, or
fits of exhaustion, that intervened, he regretted having spent
his time in curious speculations, and considered the calamity
with which he was visited as a kind of chastisement of heaven
for neglecting the spiritual duties of his profession. In this
temper of resignation, his impassible huri, and he expired
on the 15th of February, 1787. He was interred decently,
but without pomp, in the parochial church of S. Maria Pe-
don. "Such was the exit," says Fabroni, "of this sublime
fellow, whom Rome honoured as her master, whom all
Italy regarded as her ornament, and to whom France would
have erected a statue, had the fur war of space been obliged
even to throw down some of her heroes."
The abbé Boscovich was tall in stature, of a robust constitution, with a long pale visage. His temper was open and friendly, but irritable, vehement, and impatient of contradiction. James Boswell, in his amusing Life of Dr. Johnson, incidentally mentions, that the English moralist chanceing to meet Boscovich in London, had a very keen dispute with him in Latin on some metaphysical topic. There was much heat on both sides; and the Goliath of literature treated the mathematician in his usual sarcastic manner.

Boscovich was more distinguished by the elegance of his mathematical genius, than for talents of invention. The prediction he entertained for the geometry of the Greeks, led him perhaps to undervalue the modern analysis, and rather to neglect the cultivation of the integral calculus, that distinguishing instrument of discovery, which is indispensable in making any great progress in the deeper parts of physical and astronomical science. His example, with similar ones in this country, shows the danger of indulging a taile formidable in itself, but which has a tendency to circumscribe the powers of human intellect.

The only work of Boscovich that has appeared in English, is his "Elements of the Conic Sections," which was, within those few years, translated, abridged, and somewhat altered by the Rev. Mr. Newton of Cambridge. This little treatise, we are forcible to observe, has not yet received such attention from the public as it well merits. For a view of his theory of matter, see the article CORPUSCULAR PHILOSoPHY.

BOSCU$ in Ancient Law-Writers, signifies a wood of any kind. It is formed from the Greek, bosos, I feed, as serving for pallure. In which sense, bosus amounts to the same with the Italian bosco, and French bois. Boscus is divided into high wood, or timber, called allo fujus, and haubois; and coppice, or underwood, subbosus, or subbois.

Sp. B. xvarumota. A small shrub. Leaves simple, alternate, petiolate, ovate, pointed, entire, smooth, with fine purpure nerves; flowers reddish, in loose axillary racemes. Cultivated by Mr. Miller before 1728. A native of the Canary islands. La Maree intimates a doubt whether Sloane's Jamaica plant be the same.

BOSEN, in Geography, a town of Prussia, in the province of Natangen, feated on the Satten lake; 50 miles S. of Königberg.

BOSENBRUNN, a town of Germany, in the circle of Upper Saxony, and the Vuglart; 3 miles S. W. of Oelfnitz.

BOSHAM, a town of Abyllia, near the source of the river Lebb. N. lat. 7° 40'. E. long. 36° 36'.

BOSIO, JAMES, in Biography, a native of Milan, who flourished about the end of the 17th century, and being knight-heritor of the order of Malta, conducted its concerns at Rome for a long time with reputation. Disappointed in the expectation of the advancement of his patron, cardinal Petrochini, to the papal chair, he retired and devoted the remainder of his life to pious exercises. As a writer he is known by his voluminous history of the order of Malta, entitled "Dell' storia della facra religione dell' illiustrissima militia di San Giovanni Gierosolimitano," 3 vols. fol. printed at Rome, in consequence of the arrangement of two coroners, in 1621, 1629, and 1634. This is the source whence later historians of the order have derived their chief materials. Some idea may be formed of Bofio's understanding and dis- position, from the veneration which he manifested to the wood of the real crofs, of which he wrote the history from its discovery in the time of Conantite. Antonio Bofio, the nephew of the preceding, who was also agent at Rome for Malta, published in 1633, the result of his researches into the vaults and catacombs of Rome in a folio volume, entitled "Roma Sotteranea," a work that contains all the monuments and epitaphs which he could find of the first Christians. An improved edition was published in Latin by Paul Aringhi in 1651. More. Nouv. Dict. Hill.

BOSLÉ, in Geography, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Beaugency; 2 miles N. of Beaugency.

BOSNA, SERAI. See SERAJO.

BOSNA, a river of Bosnia, which passes by Serajo, and joins the Save, 50 miles N. of that town.

BOSNIA, called also Rama, a province of Turkey in Europe, being a part of ancient Pannonia, or of Turkish Illyricum, and deriving its name from the river Bosna, or from the people called Bosnici. It is bounded on the north by the river Save, which separates it from Servia; on the east by the Drino, which parts it from Servia, on the west by the Verbas, Croatia, and Dalmatia, and on the south by a chain of mountains, which separates it from Dalmatia. It is about 40 leagues long, and 24 broad; and though mountainous, it is fertile, more especially near the rivers; its arable land producing good wheat, and its pastures feeding many cattle; its mountains contain some mines of silver. Its air, foil, produce, language, and inhabitants, resemble those of Servia. Bosnia and Servia were formerly united to Hungary, and governed by their own princes; but in 1495, the Turks took possession of them; Stephen V. their last sovereign being taken prisoner by Mahomet II. and stayed alive; from that time they have been a province of the Turkish empire, which appoints beglersbeys and fanatics over them. Bosnia is chiefly inhabited by Greek Christians, together with some Mahometans, Jews, and Catholics. Its principal towns are Banjaluka, Orbach, Serajo, and Zwernick.

BOSOK, a town of Hungary, 3 miles E. of Baia.

BOSON, in Conchology, the turbo maritimus, fo called by Adanfon.

BOSOWKA, in Geography, a town of Poland, in the polkantyne of Bracaw. N. lat. 49° 20'. E. long. 30°.

BOSPHORICUM MARIME, a name given by the ancients to a species of mollusc, of a yellowish white colour, with beautiful veins of a somewhat darker hue; called also, from its transparency, phlegitor.

BOSPHORUS, or BoSphorus, formed from BOS, bos, and πόλις, polis, in Geography, a long and narrow sea which it is supplied a bulick may swim over; in a more general sense, a long narrow sea running in between two lands, or separating two continents, and by which two seas, or a gulf and a sea, are made to communicate with each other. In which sense bosphorus amounts to the same with what we otherwise call an arm of the sea, channel, or strait; the Italians, faro; the Latin, frettum, and the French pas, manche.

The name bosphorus is chiefly confined to two strights, in
in the Mediterranean sea, viz. the "Bosphorus of Thrace," commonly called the "Strait of Constaninople," or "Channel of the Black Sea," and the "Cimmerian or Scythian Bosphorus," so called, it seems, from its resemblance to the Thracian; now more commonly the "Strait of Caffa," which unites the sea of Azof with the Euxine or Black Sea.

The origin of the name is better agreed on than the reason why it was first given to the Thracian Bosphorus. Nymphius tells us, on the authority of Accarnian, that the Thracians, desiring to pass the Thracian strait, built a vessel, on whose prow was the figure of a bullock, and which was hence called fowr, bullock; and which served them for a ferry-boat. — Dionysius, Val. Flaccus, Callimachus, Apollodorus, Marcellinus, &c. say, that Io, being transformed into a cow by Juno, paddled this ferry swimming, which hence was called Bosphorus. — Arias tells us, that the Thracians were enjoined by the oracle, to follow the route which a bullock should mark out to them; and that upon hiring one up, it jumped into the sea to avoid their pursuit, and swam over this strait. Others say, that an ox, tormented by a gad-fly, threw itself in and swam over; and others, that anciently the inhabitants of these coasts, when they would pass over, joined little boats together, and had them drawn over by bullocks, &c.

Some late writers rather suppose Bosphorus to have been so called, because here was anciently the beacon-market. Tournef, Voyag. tom. ii. let. 12, and 14.

The "Thracian Bosphorus," called also the "Mythian Bosphorus," because the Myrians inhabited the country opposite to Thrace, connected the Euxine with the Propontis, or present sea of Marmae, and formed a winning channel, separating Europe from Asia, through which the waters of the Euxine flow, with a rapid and incessant course, towards the Mediterranean. This strait has been very minutely described by Dionysius of Byzantium, who lived in the time of Domitian, (See Hudson's Geograp. Minor. tom. iii.) and by Gilles or Gallus, a French traveler of the 16th century. On the steep and woody banks of this channel the ancients profusely scattered a crowd of temples and votive altars, attesting the unskilled labors, the honors and the devotion of the Greek navigators, who, after the example of the Argonauts, explored the dangers of the inhospitable Euxine. On these banks tradition long preserved the memory of the palace of Phineus, infested by the obscene laripes, which Le Clerc conjectures to have been only locusts; and of the Syrian reign of Amycus, who defied the lion of Leda to the combat of the Cella. The residence of Amycus was in Asia, between the old and the new castles, at a place called Larus Insana; and that of Phineus was in Europe, near the village of Manurome and the Black Sea. The straits of the Bosphorus are terminated by the Cyancean rocks, which, as the poets declare them, had once floated on the face of the waters; and were defined by the gods to protect the entrance of the Euxine against the eye of profane curiosity. At present there are two small islands, one towards either shore; that of Europe being distinguished by the column of Pompey. From the Cyancean rocks, to the point and harbor of Byzantium, the winding length of the Bosphorus extends about 16 miles, and its least ordinary breadth may be computed at about 2 miles. According to the statement of Oliver's "Travels" in the Ottoman Empire, p. 77, it is nearly a league long, and about 20 miles from the point of the Southern end of Constaninople to the Cyprian Islands. In its greatest breadth it is not two miles; and in several places it is so narrow, that some ancient authors say, that a person may hear the birds sing from one shore to the other, and that

BOSPHORUS, or Cimmerian Bosphorus, the name of an ancient kingdom, comprehending all the provinces that were subject to the Bosphorans princes, and bounded on the east by Colchis, on the west by the gulf Cucuteni, on the south by the Euxine sea, and on the north by the Tanais, where that river falls into the Palus Mazetic; so that it comprised the Cimmerians, Taurica in Europe, and in Asia the whole territory which lies between the Palus Mazetic and the Euxine sea. Diodorus Siculus (l. xii.) confines the kingdom of Bosphorus both between the Euxine and the boundary of Europe and Asia on that side; but Strabo (l. viii.) extends it to the gulf Cucuteni, which, with the Palus Mazetic, forms the Ilissus of the Cimmerians. The chief cities of the Bosphorans were Phanagoria, the metropolis of Bosphorus in Asia, according to Strabo, Ceti, Hermaphrodit, Stryboca, Cim-
BOSPHORUS, a city of Chersonesus Taurica, seated near the Cimmerian Bosphorus, and supposed by some writers to have been the same with Panticapeum, which, according to Strabo, was the metropolis of the European Bosphorus. But Pliny, Pontius, and Stephanus Byz. speak of them as two different cities. Strabo and Ptolomy take notice of Panticapeum, but say nothing of Bosphorus; but Procopius often mentions the latter, but never takes notice of Panticapeum; from which circumstance it has been inferred, that these two names belong to different periods, to the same city: Panticapeum being its most ancient name, recognized by Pliny, Strabo, and Ptolomy, and Bosphorus the name given to it by Procopius. Pliny, however, says, that some perfons call it Bosphorus, and that, in its origin, it was a colony of Miletians.

BOSPHORUS, a town of India. Steph. Byz.—Also, the name of a town placed by Strabo towards the Hellespont, which was ravaged under the empire of Juttinian.

BOSQUET, Francis, in Biography, one of the most learned prelates of France in the 17th century, was born at Narbonne, in 1605, and educated at Touloufe. Before he attained the ecclesiastical profition, he exercised various civil employments, viz. those of intendant of Guienne and of Languedoc; solicitor-general to the parliament of Normandy, and counsellor of state. But, in 1608, he was nominated bishop of Lodève, and entrusted by the king with the management of the national concerns; and in 1617, took possession of the bishopric of Montpellier, in which situation he continued till his death in 1676. He was held in high estimation, for his learning, piety, and charity. As an author, he acquired himself a considerable degree of reputation by his Latin translation, with notes, of the synopsis of civil law, composed in Greek verse by Michael Pellius. He also wrote a "History of the popes, who reigned at Avignon," from 1305 to 1394; and published several epistles of pope Innocent III, with learned notes. But his principal work was, a "History of the Gallican church, in the reign of Constance," written in Latin, and published with considerable augmentations in 1636, 4to. But with the omission of some liberal and spirited reflections on the fictions and errors introduced into the early accounts of the Gallican church. He also left behind him some MS. observations on the liberties of the Gallican church, and some notes on the cannon law. Gen. Dict.

Bosquet, in Ornamental Gardening, is a term applied to detached chumps or other parts of gardens, pleasurable or ornamented grounds, planted with a variety of deciduous evergreen trees, and shrubs, and herbaceous perennial flowers, either in a regular or irregular manner. They should be laid out in form suited to the nature, extent, and particular circumstances of the ground, so as to produce the greatest possible variety and effect; some being made circular, others oval or oblong, and with bending sweeps or swells outwards or inwards, and longer or smaller as may be necessary. They may be disposed with the greatest effect on the confines of extensive lawns, or other open spaces in gardens; also in parks, paddocks, the terminations of spacious avenues and carriage ways leading to the houses, especially where of considerable dimensions, being varied in situation, and distributed at such distances as to leave large intervening spaces of open land in gardens.

In the planting of compartments of this nature, in order to produce the best effect, much attention should be bestowed in regulating the sizes of the plants, their shades, and times of flowering, as well as in disposing them in the order of their different growths, so that they may rise regularly from the sides to the centres, and display themselves in the
the best and most advantageous manner in their heads and branches. It was formerly the practice to plant trees and shrubs of the deciduous and evergreen kinds, chiefly together in separate patches, but by a judicious mixture of both sorts a great richness and variety of effect are produced; various sorts of tall herbaceous perennial plants, as well as low flowering ones, may be introduced on the sides and edges, such as those of the golden rod, and other similar kinds, with daffodils, violets, polyanthuses, primroses, and many others of the same sort.

In the less extensive kinds of ornamented grounds these sorts of bosquets should always remain perfectly open and wholly exposed to view, in order that the full variety of the plants may be shown; but in extensive parks, and other similar grounds where they are chiefly planted with the more large and coarse hardy trees and shrubs, they may be enclosed with open hedges to defend them from the cropping of cattle or other animals, especially until they have acquired a sufficiently hardy and large growth.

These clumps, after being thus planted, only require the earth among the plants to be slightly dug over in the autumn, or very early spring, and once or twice hoed over in the summer to keep weeds from rising; the dead wood and irregular branches of the different plants or trees being cut out, shortened, and removed, to preserve them distinct and keep them in order. See CLUMP.

When well arranged and kept in neat order these sorts of bosquets or clumps produce much diversity and ornamental effect, both in large gardens and pleasure grounds.

BOSRA, in Geography, a town of Arabia Petraea, sunk into decay and inconsiderable note, though it is considered as the capital of the country. It is seated in the midst of the back of Palatine, on the other side Jordan, and about 130 miles from the lake, or sea, of Galilee. See BOSTRA.

BOS, or Bosse, in Sculpture, signifies relieve, or prominence. The word is French, baffe, which signifies the fame; whence also to emboss. See EMBOSSED.

Bos of a buckler, among the Ancients, the umbo, or gresso, which puts out in the middle.

Bos, among bricklayers, is a wooden utensil wherein the labourers put the mortar to be used in tiling. It has an iron hook, whereby it may be hung on the laths, or on a ladder.

Bos, Gaspar Vander, in Biography, a painter of ships, sea-views, calms, and storms, was born at Hoorn, in 1634, and manifesting an early genius for the art of painting, applied with affinity to the study and practice of it, and distinguished himself by the excellence of his composition, by a light free touch, by an agreeable tint of colour, and by a very artful manner of handling. His application was so intense as to impair his health, so that he died much regretted at an early age in 1666. Pilkington.

Boslage, in Architecture, a projecting roof, laid smooth in building, to be afterwards carved into mouldings, capitals, arms, or the like.

BOSAGES, also denote slates which seem to advance beyond the naked of a building, by reason of indentures, or channels left in the joinings, used chiefly in the corners of buildings, and thence called ruffle slates.

The cavities or indentures are sometimes round, sometimes square, sometimes chamfrained, or bevelled, sometimes in the diamond form: sometimes they are enclosed with a cassetta, sometimes with a lintel.

Boschart, Thomas Willeberts, in Biography, a painter of history and portraits, was born at Bergen-op-zoom, in 1613, and studied at Rome under Gerard Segers, with whom he continued four years. His taste of design was fine and correct, his touch free and spirited, his colouring transparent and true, and his carnations polished to much softness and life; that he was thought to approach near to Van Dyck in portrait and history; and his works were eagerly purchased. His merit recommended him to the patronage of the prince of Orange, in whose service he was employed for several years. The large picture of "War and Peace," at the Hague, and the "Martyrdom of St. George," in the great church, are much commended for goodness of expression, for excellent colouring, and for being exquisitely finished, Pilkington.

BOSSE, Abraham, a French engraver, was born at Tours, and flourished in 1636. In his performances he successfully imitated the manner of Callot; and many of his works are executed from his own designs. The figures, with which he commonly embellished his plates are drawn in a spirited style, and etched with great freedom. He afterwards retouched the etching with the graver in a bold, expeditious manner. The effect of his plates is clear and pleasing; though his lights are usually too much scattered. He was much successful in small subjects. We have a treatise by him on "The art of drawing," the best edition of which is said to be that with the additions and corrections of M. Cochin; "The school of the painter and sculptor," "The workshop of the copper-plate printer," and several other plates from his own designs; and also, "The history of the Maid of Orleans," from the designs of Vignon, See &c. Strutt.

Bossee, in Geography, a town of Germany, in the duchy of Holstein; 6 miles E. S. E. of Rendsburg.

Bossiea, in Botany, Wilden. 1242. Chils, diadelphus decandria.

Bossiney, in Geography, an ancient borough of Cornwall, in England, is reduced from its original consequence, and now consists of only a few miserable cottages; yet some of the occupiers of these dwellings have the power of electing two members of parliament. This place, with many other towns in the county, was made a chartered borough by Richard earl of Cornwall, brother of Henry III.; but the town has never been incorporated. The right of election is vested in all persons who possess lands within the borough, and live in the parish, but this number is now reduced to five or six.

Bossiney is in the parish of Tintagel, where are the remains of a castle occupying a very singular situation. The fortrefs stood partly on the main land and partly on a bold flat promontory, which was separated from the shore by an immense chasm in the cliff, over which there was formerly a drawbridge. What remains on the peninsular part is a circular ruinous wall, which incloses some buildings that appear to have been the keep. Beneath is a pajage through the rocks, where boats could pass at the time of high tides. From the extent and character of the ruins it is presumed, that this fortrefs has been a place of great strength and security. It is affented by many writers, that it was the birth-place of the celebrated British king, Arthur, but this assertion is not satisfactorily substantiated. See Arthur. The bold, stupendous cliffs about Tintagel, and along the northern coast.

BOS

coast of Cornwall, cannot fail to excite emotions of admiration and terror in the minds of most spectators. From "Tintagel to Landewednack the road winds through various rocky chains. The latter village is seated at the bottom of a deep valley, washed by a small inlet of the sea, while mountaneous cliffs encircle it. This place was formerly noted for a castle, built by one of the Bottereaux family; but no fragments are now remaining. History of Cornwall, vol. i. 290.

BOSSO, Matthew, in Biography, an ecclesiastic distinguished for his learning and virtues, was born at Verona, in 1428, and educated first at Milan, and after his admission into the congregation of canons regular of the Lateran, at Padua. His merit advanced him to several eminent offices in his order; and at Fiesole, where he superintended the canonry of St. Bartholomew, he became acquainted with Lorenzo de Medici, who appointed him his confessor; and it was from his hands, and in his church that John, the son of Lorenzo, afterwards pope Leo X. received the engravings of the cardinalate. He was offered a bishopric by pope Sixtus IV. for his services in checking the disorders that prevailed in the nunneries of Liguria, and the adjacent provinces, but refused to accept it. After having five times sustained the office of visitor, and twice that of procurator-general of his order, he died at Padua in 1503. Of his works the principal are, viz. "De falsitatis animi gaudibus;" "De infinitudine sapientia animo;" "De tolerandis adversis;" "De gerendo magistratu;" "De immoderatione mulierum culcis;" and a collection of letters and small pieces, entitled "Recuperationes Fidelissimae," printed at Bologna, in 1493, and furnishing one of the finest specimens of typography of the 15th century. Gen. Dict. Rollioe's Lorenzo de Medici, vol. ii.

BOSSO, in Geography, one of the five glaciers of Swisserland, that stretch towards the plain of Chamonzy, and unite at the foot of Mount Blanc. See Glacier.

BOSSU, René Le, in Biography, a polite scholar and eminent critic, was born at Paris in 1631; and having received the rudiments of his education at Nanterre, he was admitted a canon regular in the abbey of St. Genevieve, at the early age of 18 years, and purged the lilies of philosophy and divinity. After having received priest's orders, in 1657, he indulged his inclination to the Belles Lettres, and devoted himself for several years to the employment of teaching them. At length he retired to pass his time in tranquil study at the abbey of St. Genevieve; and in this retreat, where he was sedulously employed, published his "Parallel of the Philosophy of Descartes and of Aristotle," and his more popular "Treatise on epic poetry." He also published a small piece in favour of Boileau against St. Sarlin; but the greater number of his compositions remain in MS. at the abbey of St. John, at Chartres, of which he was made sub-prior in 1677. He died in 1680. Bossu was distinguished by a sound judgment, well regulated, but lively imagination, and a mild, benevolent character. His work on epic poetry furnishes many judicious rules, of which however, Voltaire says, that they will never make a poet. "It was left in an imperfect state; the author having intended to exemplify his rules from Horace and Virgil. The best edition is that of the Hague, in 1714, with a memoir on the life and writings of the author by father Courayer. Gen. Dict.

Bossu, in Geography, an island about 3 or 4 leagues N. E. from Trinity Point, on the north coast of the Gulf or river of St. Lawrence.

BOSSUET, James Benignus, in Biography, a famous French divine, celebrated for popular eloquence, for his talents as a controversial divine, and for his elaborate vindication of the Roman Catholic faith, was born at Dijon in 1621; and having for some time pursued his studies under the care of the Jesuits, who wished him to enter into their order, he was rescued from them by the interposition of his uncle, and in 1643 sent to Paris to finish his studies at the college of Navarre. As he had devoted himself to the clerical profession, theology was the object of his particular attention; and his favourite author was Anguifl. To the study of polite literature he dedicated a portion of his time; and whilst he was a professed admirer of Homer, he disapproved the introduction of mythology into modern poetry. And though the range of his studies was very extensive, he disregarded mathematics from a preconceived notion, that they would not contribute to make him a founder divine, or a more eloquent preacher. The philosophy of Descartes recommended itself to him by its novelty, and he adopted it, notwithstanding the reproach and perdition which it underwent. After completing his theological course, he received the degree of doctor of the Sorbonne in 1652, and then removed to Metz, where he was appointed canon of the church. Here he wrote his first polemic piece, which was a refutation of the catechism of a Huguenot minister of that town, with whom, however, he lived on terms of uninterrupted friendship. Upon his return to Paris, his eloquence as a preacher recommended him to royal patronage. In 1661, he preached before the king, and his conduct during his residence at Versailles was valued to the dignity of his profession. He soon obtained, without any solicitation on his own part, the bishopric of Condom; but when he was appointed preceptor to the dauphin, in 1670, he resigned this preferment, and devoted himself entirely to the discharge of the duties of this honourable and important office. In this situation he composed for the use of his pupil, his discourse on universal history, which, notwithstanding some objections that have been urged against it, is considered as his principal performance, and much more inductive and useful than all his theological and controversial writings. As soon as he had completed the education of the prince, Lewis XIV. advanced him, in recompense of his attention to this object, in 1681, to the see of Meaux; and in this situation of greater leisure, he employed himself in the defence of the church against both infidels and protestants. In his polemic writings he displayed much logical acuteness and dexterity in illustrating the doctrine of the church, and the variations submitting among protestants; and he dedicated his chief arguments in favour of the former, and in opposition to the latter, from the antiquity and unity of the churches; the authority of fathers, councils, and popes, during a long series of ages; the novelty of the pretensions of the reformers; the necessity of an umpire in the province of religion for settling disputes, explaining the scriptures, and maintaining order and peace; and the necessity of submitting to such an umpire, in order to prevent that disunion and variety of sects, each professing its right to interpret the divine word, and claiming the honour of being the true church, which disapproves the cause of the protestants. The latter were ably defended by the French Calvinists, and particularly by the celebrated Claude, to whom, in the controversy, some even of the catholics have allowed the superiority. Leibnitz also became a party in the dispute between the protestants and papists, and recommended, for the sake of unity and peace, mutual concessions. But Bossuet remained inflexible, and conceded only that the sacramental cup might be allowed, as a matter of favour, to the laity. He was, however, no advocate for the infallibility of the pope, or for his assumed right of deposing kings; but zealously opposed both these claims,
claims, when urged by Innocent XI. against the independ-ence of the crown, and the liberties of the clergy of France. The consequence of his opposition was the loss of the cardinal's hat, which the pope offered him as an inducement to his desiring to prosecute this dispute.

Bosselet, not content with writing on general subjects, such as the defence of the Christian religion, the catholic faith, and the Gallican church, undertook to refute the notions of the amiable Fenelon concerning quietism ; either because he considered these notions as erroneous and dangerous, or because he wished to degrade in the general estimation the character of a pervert, whom he regarded as a rival. Fenelon complained of the harshness with which he was treated; and such indeed were the impetuosity and zeal with which he entered into this dispute, that being once at court he maintained his opinion with a degree of ardour, which led the king to fay to him, “What would you have done, if I had taken part with Fenelon you?” Bosselet replied with great spirit, “I would have spoken ten times as loud.”

On another occasion, however, he was less diffident to give offence; for though he had composed theatrical exhibitions, to which Lewis was addicted, yet being asked, what he thought of attending them, he replied with a considerable degree of address, “For it there are great examples, and against it strong arguments.”

Of his talents as a speaker Bosselet exhibited a specimen that was much admired, at the early age of 16; and as to his style of preaching, it was lofty, free, animated, and energetic. As he possessed a retentive memory, he seldom wrote down more than the heads of his discourses, and supplied the intervals extempore, but as the result of previous meditation. Hence it happens, that his printed sermons are rather bold and masterly sketches than finished compositions; and however much they have been admired, they are far excelled by the discourses of Maffillon and Boulainvilliers.

But his funeral orations are considered as surpassing all others with respect to sublimity and pathos. Of the seven which he delivered and published, the three that have claimed pre-eminence are those for the queen of England, widow of Charles I., in which is introduced a fine delineation of Cromwell’s character and politics; for the duchess of Orleans, sister to Charles II.; and for the famous prince of Condé.

In the exercise of his episcopal and pastoral functions Bosselet was entitled to great respect and commendation. He was eminently distinguished by his attention to the duties of his office; by his diligence in communicating instruction to the ignorant, and comfort to the afflicted; and by the exercise of an exemplary hospitality to the indigent. In his clerical visits he paid particular attention even to peacocks and children. Whilst he was thus amably employed, he closed a prudent and dignified life, in the year 1704. It ought to be recorded to his honour, that, though he was a zealous advocate for the doctrines of the church of Rome, he was no friend to perfecution, and expressed his disapproval of the severity exercised toward the Huguenots. Nevertheless, it does not appear that he ever reprehended the king the injustice, cruelty, and impolicy of this conduct.

“The behaviour and manners of Bosselet always com-manded respect, but they often betrayed thoughtfulness, a domineering disposition, and a high opinion of himself; and showed he had but little of that spirit of meekness and gentleness, which in the archbishop of Cambrai was joined to every virtue that inspires veneration. The difference of their characters is easily discerned in their writings. In those of Bos-}

fouling; in those of Fenelon, he feels the peremptory power arising from the union of a fine genius with genuine benevo-

lence. Accordingly, the former has been said to have dem-ontrated the truth, and the latter to have exhibited the amiability of religion.”

Of the works of Bosselet a collection was made in 1743, in 12 vols. 4to., to which was added, a supplement of 5 vols. 4to.; and the Beneficiates of St. Maur have published 12 vols. of a new and improved edition. He also wrote in Latin a defence of the declaration of the French clergy on ecclesiastical power. Bosselet was a distinguished member of the French academy, into which he was admitted in 1671. Elige Academica par d’Alembert. Nov. Dict. Hist. Morci. Gen. Bisi.

BOSTON, or Best, in Geography, a town of Persia, in the province of Segistan, or Selitan, seated on the banks of the river Hezemund, or Hindmund; distant about 75 miles S.W. from Candaian. N. lat. 32° 30’. E. long. 64° 25’. From this town Abdulfath Ali Ben Mohammed at Katch, one of the most illustrious poets who flourished under the dynasty of the Samanides, derived the appellation of Al Bifot. Herbelot.

BOSTAN, a town of Asiatic Turkey, in the province of Room, seated in a fertile plain of the same name, watered by the river formerly called “Sarvis,” and sur-

rounded with mountains, on the northern side of Mount Taurus. The town is small; and its inhabitants prefer a thriving contral to the more polished natives of Syria. Their common dress is a short jacket and a fringed turban. The women, whose complexion is fair and florid, wear on their heads flat pieces of metal, some of silver, and others of copper, according to their rank, which they tie under the chin, and thus shelter their faces from the sun and rain. N. lat. 38° 12’. E. long. 36° 28’.

BOSTANGI-BASCHI, or Bofange Baschi, in the Turkish Affairs, an officer in the grand seignior’s household, who has the superintendence of all the gardens, water-works, and houses of pleasure, with the workmen employed in them. The pool of bostangi-baschi, or chief gardener, is one of the most considerate in the Turkish court; and his power is very extensive. He has the emperor’s car, and on that account is much courted by all who have business depending at the Porte; he is governor of all the villages on the channel of the Black sea, and has the command of above ten thousand bostangis, or gardeners, in the seraglio, and other places about Constantinople. His reprefles debauchery, and punishes theft and other offences. But that which gives him the greatest excel- lence is the honour he has of holding the rudder whenever the grand seignior takes his pleasure on the water, and of accompanying him every where on horseback, whenever he goes out in state. This officer is of the number of the four “Ricab acgleri,” or officers of the court, who are obliged to attend the sultan on all solemn occasions; the other three are called “Buyun-imborphori,” or great equerry; “Kurchuimborphori,” or little equerry, and “Capidjar-kiyafa,” or great chamberlain. The bostangies are generally sons of Musulmans; their pay is tolerably good, and they are al-most all married. They were established under the reign of the first emperors, and for a long time furnished a nursery of the bell followers. Thos. of them who displayed the greatest courage and strength, and more especially the highest degree of fanaticism, were transferred to the janizaries.

BOSTON, in Geography, is a large commercial borough-
town of Lincolnshire, in England. It stands in that division of the county called Holland, and is nearly surrounded by the fens; the greater part of which having been inclosed and drained, is now appropriated to arable and meadow
lands. Previous to this great national undertaking, Bolton had but few of its population and trade; but this event has changed the town. It stands on the bank of the river Witham, which empties itself into the sea about five miles out of the town. Here is a commercial and well-frequented harbor; and formerly a great trade was carried on in the expectation of wool; but being prohibited, the merchants were compelled to seek profit in other commodities, and have nearly kept pace in the characteristic commercial spirit of the country. By advancing the population, opulence, and trade of Bolton, it is now one of the most considerable towns and ports in the county of Lincoln; and, besides two weekly markets, has four annual fairs.

Bolton, according to Bede, was anciently called Botolph's town, from St. Botolph, a Saxon, who founded a monastery here, which, according to the same venerable writer, gave origin to the town. Other writers state that the Romans had a station here, and in support of this opinion refer to some ancient foundations of buildings, seven stones, and urns, that were discovered here in 1716. This town sent representatives to three national councils, 11th, 26th, and 27th of Edw. III, and first returned regular members in Edw. VI.',s time. It was incorporated in the last year of Henry VIII.'s reign. The number of voters amounts to nearly 200. About the end of Henry I.'s reign, a man, named Robert Chamberlain, with some accomplices, disguised in the habits of monks, set the town on fire in several places, for the purpose of plundering the inhabitants. Chamberlain was taken, and executed, but refused to impeach his accomplices.

The corporation, by whom the town is governed, consists of a mayor, who is chief clerk of the market, and admiral of the coast; a recorder, twelve aldermen, eighteen common-councilmen, a judge, and marshal of the admiralty, a coroner, two serjeants at mace, and other inferior officers.

The river Witham is navigable at spring-tides for vessels of ten to eleven feet water; and many of them are employed in the corn-trade to London. A communication is opened between this place and Lincoln, by means of a canal; and another cut communicates to Sleaford, Horncastle, &c.

Bolton had formerly, besides St. Botolph's monastery, a priory, four friaries, and three colleges. It had also two churches; but that of St. John's is entirely destroyed. The other, dedicated to St. Botolph, is a large, elegant pile of building, with a lofty tower, which is justly admired for the lightness, neatness, and beauty of its various compartments. In the year 1509, was laid the foundation of this structure, which has since proved the pride and boast of the Boltonians. It is 300 feet in height, and is said to be the loftiest tower in England. From its top is a most extensive view over the flat lands of Lincolnshire. The whole height is divided into four compartments, of which the uppermost is formed into an octagon-shaped lantern, each side perforated with pointed arched windows, and filled with mullions and tracery. This is attached to the square tower by flying buttresses, terminated by purled pinnacles. The three other compartments are ornamented with highly decorative windows and tracery; and at each corner are two strong ornamented buttresses. The church, though more ancient than the tower, displays a fine example of English florid ecclesiastical architecture. Large in dimension, lofty and light in its general character, and richly elegant in the various decorative ornaments of windows, oratories, door-ways, &c., it will be examined with delight by the Architectural antiquary. It consists of a nave, chancel, side aisles, south porch, chapels, &c.; and is one hundred feet in width, by three hundred feet in length. In the upper part of the nave are twenty-eight pointed windows, between which are fourteen groined arches, with light spandrils curiously moulded. These, with their interlacing and embossments, produce a very beautiful effect, which is improved by the lofty columns and arches that divide the centre from the side aisles.

The general appearance and convenience of Bolton have been much improved within the last twenty years. Many obstructions have been removed, and new buildings erected. The market-place is spacious, and is ornamented with a handsome flower-croft. In 1773, the corporation built an excellent fish-market, which is abundantly supplied with sea and river fish. Queen Elizabeth gave the corporation a court of admiralty over all the adjacent sea-coast. Vessels arrive here from Stanton's wharf, London, every ten days; and from Hull and Lynn, every spring tide. Several foreign ships trade here in summer with timber, wine, &c. Bolton is 75 miles east of Lincoln, and 166 miles N.E. of London. It contains 1,252 houses, and 5,926 inhabitants.

Boston, the capital of the slate of Massachusett's, in America, the largest town of New England, and the third in size and rank in the United States, lies in N, lat. 42° 24' 15" N. and W. long. 70° 58' 59". This town, together with the towns of Hingham, Chelsea, and Hull, constitutes the county of Suffolk; and it is distant 5 miles S. by W. from Portmouth, 164 N. E. from New Haven, 252 N. E. from New York, 337 N. E. from Philadelphia, and 500 N. E. from the city of Washington. It is built upon a peninsula of irregular form, at the bottom of Massachusetts's bay, and is joined to the land by an isthmus at the southern end of the town leading to Roxbury. Its length, including the neck, is 3 miles; that of the town itself is not quite 2 miles; its widest part, 726 yards. The peninsula contains about 700 acres (some say 1,020), in which are 2,376 dwelling-houses. The number of inhabitants, in 1790, was 18,038; but it has since been much augmented. The town is intersected by 97 streets, 36 lanes, and 26 alleys, besides 18 courts, &c., many of which are irregular and incommodeous. Street-restaurant is very spacious, and extending in a line with Long wharf, where strangers usually land, exhibits a flattering idea of the town. Boston contains 19 edifices for public worship; 9 for congregationists, 3 for episcopalians, and 2 for baptists. The Friends, Roman catholics, Methodists, Sandemansians, and Universalists, have also one appropriated to each. Most of them are ornamented with beautiful spires, and furnished with clocks and bells. The other public buildings are the state-house, court-house, two theatres, concert-hall, Faneuil hall, gaol, almshouse, workhouse, bridewell, and powder magazine. Franklin place, adjoining Federal street theatre, contains a monument of Dr. Franklin, and is reckoned a great ornament to the town. A magnificent state-house is also erected on the south side of Beacon-hill, fronting the mall, and overtopping the monument on Beacon-hill. The market-place, in which Faneuil hall is situated, is plentifully supplied with all kinds of provisions, both from the country, and from the ocean, and rivers.

The harbour of Boston is formed by point Alderton on the south, and by Nahant point on the north. It is sufficiently capacious to admit 500 vessels to ride at anchor in good depth of water; but the entrance is so narrow, as hardly to allow two ships to pass abreast. It is diversified with about 60 islands, the greatest number of which consist of rocks and banks of sand, slightly covered with verdure; but about 15 of them afford excellent pellmellon, hay, grain, and agreeable places of retreat in summer to parties of pleasure. At the distance of about three miles from the town is Castle Island, the fortifications of which, formerly called Castle William,
William, defend the entrance of the harbour, and are garnished by about 50 soldiers, who guard the convicts, sent hither for hard labour, and chiefly employed in making nails. The light-house stands on a small island at the north entrance of the channel (point Alderton and Nantucket heights being on the south), and is about 63 feet high. In fleeing for it from Cape Cod, the course is W.N.W. when within one league of the cape; the distance from Cape Cod to the lighthouse is about 16 leagues; and from Cape Ann the course is S.W. distant ten leagues. A cannon is lodged and mounted at the lighthouse, to answer signals. Of the islands then only are within the jurisdiction of the town, and taxed with it; viz. Nodlee's, Hog, Long, Deer, Spectacle, Governor's, and Apple islands. The wharfs and quays in Boston are about 80 in number, and very convenient for vessels. Long wharf, or Boston pier, extends from the bottom of State-street 1743 feet in a straight line into the harbour; its breadth is 104 feet, and at the end of it are 17 feet of water at ebbe-tide. Adjoining to this wharf on the north, is a convenient wharf, called from its former proprietor, and its form, Minor's T. Here vessels are supplied with fresh water from a well surrounded by salt water, and dug at a great expense. On the north side Long wharf is covered with large and commodious stores; and a canal has been cut, in order to connect this harbour with Roxbury.

In approaching Boston from the sea, it presents a beautiful and picturesque object. It lies in a circular but irregular form round the harbour, and is ornamented with spires, above which the monument of Biscoe-hill is prominent, bearing on its top a gilt eagle, with the arms of the Union; and on its sides, a variety of inscriptions commemorating some of the most remarkable events in the late war. Beech hill is the highest point of land on the peninsula; the common below it contains about 47 acres, refreshed by perpetual breezes; and on its calf side is the Mall, a pleasant walk, about 600 yards long, adorned with rows of trees. Charles river, and Mill River, with, and the latter, join the sea at Boston, and both are entered on Charles river, which mingle its waters with those of Myllic river in Boston harbour. Charles river bridge connects Boston with Charlestown, in Middlesex county, and is 75 piers, and is 1,503 feet long and 42 feet broad. Boston bridge stands on 180 piers, and is 2,918 feet long, and 40 feet wide. Both bridges have for the admission of vessels, and lamps for the benefit of evening passengers. Boston has seven free schools, supported at the public expense, in which the children of all citizens are freely admitted; and besides these, many private schools.

The principal societies in the commonwealth hold their meetings in these town; these are the Marine Society, American Academy of Arts and Sciences, Massachusetts Agricultural Society, Massachusetts Charitable Society, Boston Episcopal Charitable Society, Massachusetts Historical Society, Society for propagating the gospel, Massachusetts Congregational Society, Medical Society, Humane Society, Boston Library Society, Boston Mechanic Association, Society for the Aid of Emigrants, Charitable Fire Society, and seven respectable lodges of free and accepted masons.

For the support of the foreign and domestic trade of Boston, which is very considerable, there are three banks; viz. the branch of the United States Bank, the Union, and the Massachusetts's bank; the latter confides of 800 shares of 500 dollars, equal to 400,000; the capital of the Union bank is 1,200,000 dollars, 450,000 of which is the property of the state. The principal manufactures of Boston consist of rum, loaf-sugar, beer, fall-cloth, cordage, wool and cotton cards, playing cards, pot and pearl-shells, paper-hangings, hats, plate, glass, tobacco, and chocolate. It has 30 distilleries, 2 breweries, 8 sugar-houses, and 11 rope-walks. The number of the different flags that run, through the week, from this town, is upwards of 20; and on the great road between Boston and New Haven, there are constantly employed 200 carriages and 100 horses.

For the government of Boston nine select men are annually chosen; and at the same time are chosen a town-clerk, a treasurer, twelve overseers of the poor, twenty-four firewards, twelve clerks of the market, twelve scavengers, twelve constables, and a number of other officers. Besides those called "trunk bands," there are four other military companies in Boston; viz. the ancient and honourable artillery company, the cutters, fitters, and artillerists.

The settlement of Boston took place as early as the year 1631 from Charlestown. It was called by the Indians Shawmut, and by the settlers from Charlestown Trinimountain, from the view of its three hills; and it derived its present name from respect to the Rev. Mr. Cotton, a minister of Boston, in England, and afterwards minister of the first church in this place. In 1727, it was much damaged by an earthquake, and has since frequently suffered severely by fires, its houses having been mostly built of wood. The revolution, whence America dates its independence, commenced at Boston. Morfe.

**Boston Corner.** A tract of land adjoining mount Washington, in Berkshire county, and state of Massachusetts, containing 67 inhabitants.

**Boston, New.** A township of Hillsborough county, New Hampshire, containing 1202 inhabitants; 12 miles S.W. by W. from Amuckeag falls, 60 miles W. of Portland, and equally distant N.W. from Boston.

**BOSTRA, Bosra, Bosrah, in Ancient Geography.** One of the principal towns of Arabia, and the capital of a canton or province called "Auranite." It was the capital of the early Idumea, and the royal residence of Joba, the son of Zerah, duke of Edom; and in scripture history, it is commonly mentioned as situate in a wilderness, because it stood on the confines of Arabia Deserta. It was, however, in those times to which the ancient biblical history refers, a considerable place; having been made a Levitical city by Joseph, and a city of refuge. It is likewise celebrated by ancient writers and medals; and several of its bishops, at a later period, afflicted at some of the ancient councils. It was distant four days' journey from Damasfeus, had a very strong castle, a gate 20 cubits high, and one of the largest basons or reservoirs in the Levant. It was captured by Alexander the Great after the battle of Issus, and he seems to have been much attached to it; but after his death it became subject to the Selucidian kings of Syria, until the time of Antiochus Dionysius, when it was conquered by an Arabian prince. Under the reign of Trajan, it was subjected to the dominion of the Romans. At this time it was comprehended in a province of Arabia; and Trajan adorned it with many magnificent edifices, established it as a new city, and gave the inhabitants permission to denominate it "Trajana." The emperor Septimius Severus enlarged this city, whence some have regarded him as its founder. This prince, or his immediate successors, conferred upon it the names and honours of a metropolis. Under the reign of Alexander Severus, it was considered as a place of importance, on account of its situation on the frontiers of the empire; and it was thought worthy of receiving a Roman colony. In honour of Alexander Severus, it assumed the name of "Alexandriana." The two principal divinities worshipped at Botra were Bacebus and Urania. Bacebus Dionysius was, according to Diodorus Siculus, the Oliris of
the Egyptians; and this deity was denominated "Dufares" by the Nabatean Arabs in the vicinity of Bostra. According-ly, the inhabitants of this city engraved a figure of their god Dufares on their medals at Bostra. There was also a temple of the goddess Urania, which was engraved on a medal of Septimius Severus, and also on one of the emperors Mammanes. The worship of Jupiter Ammon, and of Serapis, was also admitted into Bostra, and they received from the Greeks that of Jupiter Helius or Amicus. The citizens of Bostra regarded Urania as the tutelary deity of their city. The Dacarian genres, which were first discovered on medals under the reign of the emperor Philip, were celebrated at Bostra, in honor of Dufares, the Bactrius of the Arabians. When Arabia was divided, after the conquest of it by Trajan, Bostra was appointed the metropolis of that part which retained the name of Arabia; and its bishop afterwards became the metropolitan of the ecclesiastical province. See Bostra. — Another town of the same name, but less celebrated, is mentioned among the Moabite cities, in Jer. ch. xlviii. v. 24.

BosTrychites Lapis, derived from βοστρυχίτης, I fold the hair in braids, in Natural History, a name given by some to a flake supposed to contain women's hair included in it: some have understood by it, those pieces of crystal which have accidental fonnelles in them, resembling hair, or pieces of hair, caused by earthy or metallic matter; others call by this name those German agates, which contain either the conserve or other capillary water plants, or other fonnelles running into their form; the firdt of these very frequently have the conserve of great length, and variably undulated and turned about, so as very elegantly to represent a loosely flowing lock of hair.

BosTrychites is also a name given by some authors to a species of pyrites, whose raiations were supposed to imitate hair.

BosTRICHUS, in Entomology, a genus of Coleopte-
rous insects distinguished by having the antennae caved; the club solid; thorax convex, with a flight margin; head inflected, and concealed under the thorax. Gmel. Fabr. &c. The species of this genus are capucinus, flavicornis, elonga-
tus, typographus, chalcographus, polygraphus, microgra-
phus, bidentatus, scolytus, creatus, pygmaeus, ligniperda, piniperda, tectacera, varius, vitatus, minutus, maculatus, bifacians, limbatus, fulces, and pilonos; which see.

BosULS, in Geography, a town of France, in the de-
partment of the Aervon; 34 leagues N. E. of Rhodes.

BosWELL, James, in Biography, son of Alexander Boswell, lord Auchinleck, one of the judges in the supreme court of sefion, and judicatiy in Scotland, was born at Edin-
burgh, Oct. 29, 1743, and received the first rudiments of edication in that city. He afterwards studied civil law in the universities of Edinburgh and Glasgow; and during his residence in these cities, he formed an intimate acquaintance with some English students, which produced a predilection for their manners, that contributed in a great degree to his future habits and attachments. Ambitious, in early life, of distinguishing himself by his literary talents, he was so for-
tunate as to obtain the patronage of the late lord Somerville, of which he always retained a grateful remembrance. In 1765, he visited London, to which he became much attached, and where he fixed his principal residence. Here he enjoyed the advantage of cultivating an acquaintance with several persons of literary character, to whom he recommended himself by his attention, and by the urantry of his manners. Although his father had intended him for the profession of the law, his own inclination led him to wish for a commision in the army; but he gave up this object in deference to lord Anchinleck's persuasion, and at his desire returned to Scotiaand; and renewing his attention to the law, pursued a course of regular instruction, and passed his trials as a civilian at Edinburgh. In compliance with his father's wishes, he attended the lectures of an excellent civilian at Utrecht, in the winter of 1762; and afterwards obtained permission to make his grand tour of Europe. During his winter's refi-
dence at Utrecht, he visited several parts of the Nether-lands, and then commencing his projected travels, he passed from Utrecht to Germany, and pursued his route through Switz-erland to Geneva; from hence he crossed the Alps into Italy, paying his respects in the course of his journey to Voltaire at Ferney, and to Rossfian in the wilds of Neuf-
chatel. In Italy, he associated with Lord Mountfiault, to whom he afterwards dedicated his "Thesias Juridicae." From Italy he failed to Corfica, and, traversing the island, he obtained the friendship of Pafcal de Pauli, in whose palace he resided during his stay. From Corfica he went to Paris; and returning to Scotland in 1766, he soon after became an advocate at the bar in that country. In the famous Douglas caufe, which was at that time a subject of dis-
cussion, he published a pamphlet entitled "The Efficiency of the Douglas Caufe," which contributed to his popularity. In 1768, he appeared with his "Account of Corfica, with memoirs of general Pauli," which was highly spoken of by Dr. Johnfon, and translated into the German, Dutch, Italian, and French languages. His prologue, written in the winter of this year, on occasion of opening the theatre royal at Edinburgh by David Roft, esq. was flattering to the author, and beneficial to the manager, as it secured to the latter the uninterrupted possession of his patent till his death in Sept.

1792. In the celebration of the Shakfpeare jubilee at Stratford upon Avon, in 1769, Mr. Boswell took a conspicuous part, appearing at the masquerade exhibited on that occasion, under the character of an armed Corfican chief. In 1783, he published his letter to the people of Scotland, which, according to the opinion given of it by Dr. Johnfon, in a letter to the author, "contains very considerable knowlledge of history and the constitution, very properly produced and applied." As this letter was sanctioned by the approba-
tion of Mr. Pitt, it was soon followed by another, in which Mr. Boswell displayed his usual energy and political talents. In 1785, he published "A Journal of his Tour to the Hebrides," with Dr. Johnfon; and in the same year he removed to London, where he was called to the English bar. But his profession seems to have been the object of his attention than the "Life of Dr. Johnfon," for which he had been collecting materials from the commencement of his acquaintance with him in the year 1765, to the time of his death, and which was published in 2 vols. 4to. in 1791. Few persons can be supposed to be better qualified for this undertaking than Mr. Boswell; for he had known, and he had familiarly, and almost daily, conversed with Dr. Johnfon for more than twenty of the last years of his life; during which, he was happy in the kind regard and unrestrained confidence of his venerable friend, who, as we are informed by Mr. B. himself, was fully apprized of his biographical intention, and manifested no disapprobation of it. Of this work, which at first became very popular, it will be sufficient to observe, that it exhibits a faithful history of Johnfon's life, exemplified in a variety of anecdotes, that rendered it equally in-
structive and entertaining. The last literary performance of Mr. Boswell was the preparation of a second edition of this work. Mr. Boswell combined, with considerable intellectual powers, a gay and active disposition; and he often experienced an unaccountable depression of spirits. In one of his gloomy intervals he composed a series of essays under the title
BOS

title of the "Hypochondriæ," which appeared in a periodical publication about the year 1705, and which he once thought of collecting into a volume. Soon after his return from a visit to Auchinleck, he was seized with a disorder which put an end to his life, in Portland Street, June 19th, 1795, in the 57th year of his age. At the close of his journal of the tour to the Hebrides, after having given a sketch of his own character, he introduces, not indeed without an apology, the encomium of Dr. Johnson, whose friendly partiality to the companion of his tour represents him as one "whose acuteness would help my inquiry, and whose gaiety of conversation and civility of manners are sufficient to counteract the inconveniences of travel in countries less hospitable than we have passed." He left his wife, to whom he was married in 1769, in the year 1795, and she left him two sons and three daughters. She was a lady, who to the advantages of a polite education united a superior understanding; and on occasion of her death he honoured her memory with an affectionate tribute. Dig. Dict.

BOSWORTH, Market, in Topography, a town in Leicestershire, England; situated on a hill, and celebrated in history as the nearest place of note to the scene of battle between Richard III. and Henry earl of Richmond. The manor anciently belonged to the earls of Leicester, and by a partition came to Saer de Quincy, earl of Winchester, who, in the reign of King John, gave it to Richard de Harcourt, of Stanton Harcourt, in Oxfordshire, whose descendant Richard Harcourt, when lord of the town, obtained from Edward I. the privileges of a market (Wednesday) and a fair. The manor continued in this family till Henry VIII. 's reign, when it came to the marquis of Dorset; and from him, by the earl of Huntingdon, to Sir William Deyce knight, whose heirs are, or lately were, owners of it. Bosworth is 106 miles N.W. from London, and contains 120 houses and 751 inhabitants. The church is large, contains some ancient arms and monuments, and has a beautiful spire; it had five chapels belonging to it. There is a free-school, for which Anthony Blackwell, a learned divine, was master, and Samuel Johnson (afterwards LL.D.) so celebrated in the literary world) his usher. Thomas Simpson, the mathematician, was born here in 1710, who, from indigent circumstances, and the business of stuff-weaving, acquired so deep a knowledge of mathematics, as to rank him with the most scient men of the age, and to raise him to the professorship at Woolwich, and F.R.S. He died at Bosworth, 1761. See Simpson. Nichols' History of Leicestershire, see Market Bosworth, et seq.

Bosworth, Battle of, in History. This battle, on which the kingdom of England depended, and which terminated the civil war between the houses of York and Lancaster, was fought August 22, 1485, on a large flat plain, called Radmore plain, 3 miles from Bosworth, and 4 miles from Hinckley, between Henry earl of Richmond at the head of 6000 men, and king Richard III. with an army above double that number: about 100 of the former were slain, and about 4000 of the latter. The battle, which lasted little more than two hours, was decided by the death of Richard, as his followers then fought with such spirit of flight, and left Richmond master of the field and kingdom. Richard fought with singular intrepidity; his body, being found among the slain, was ignominiously thrown across a horse, and carried to Leicester, where it was interred in the Grey Friars church. Many relics of this battle have at various times been found by digging and ploughing in the field. These were spurs, rings, armour, crooks, bows, arrow-heads, &c. King Richard's dagger, and Crown hill, where Richmond harangued his army, preserve the identity of the place. Henry's Hist. of England.

BOTABA, in Geography, the name of one of the Louisiana, or Marian islands.

BOTADOTA, in Ornithology, a name given by some writers to that species of foa or swallow (hirundo eudentes), whose nests are so famous for lumps in China, and in some of the islands in the Indian ocean. See Scissurae Hirdno. The nests are supposed to be retorative, and greatly provoking to venery, and which last quality it is that the eastern nations in general are so fond of them. See Bird's Nests.

BOTANIST, in Middle Age Writers, a fee paid for wine sold in bote, or butt.

Wine that taffes of the calf is called vinum botatum.

BOTALE FORAMEN, in Anatomy, an aperture in the heart of a fucus, whereby the blood is enabled to circulate, without going into the lungs, or the left ventricle of the heart. See Fistula, Circulation, and Heart.

BOTALLUS, Leonard, in Biography, an eminent physician of Piedmont, flourished about the middle of the 16th century. He was a disciple of Galenopis, and took his degree of doctor in medicine at Padua. It appears by his writings, that he made the profitable experience of practice. That he was in great estimation, appears by his having been made in succession physician and aulic counsellor to Charles IX. Henry II. of France, and to William prince of Orange. He was also skilled in the practice of surgery, having been instructed under his brother in the camp of the prince of Orange, whom he cured of a wound, in which the cartilage of the arm was injured. His works are: "De curandis vulneribus felopotorum," 1560, Venet. This has been frequently reprinted, and continued, for a long time, to be esteemed the most useful manual that had been published on the subject. "Commentarius duo, alter de medeci, alter de regali, munere," 1665, Lyon, 8vo.; in this he lays down rules for the conduct of the physician, the surgeon, and the apothecary, in their attendance upon the sick. But the work by which he is most known, and which produced an important revolution in the practice of medicine, is his "De curandis vulneribus folopotorum," antd. 1583, 8vo. Though bleeding had always been occasionally used in the cure of diseases, yet in his time it was nearly constantly superseded by purging medicines, or it was too sparingly used, and seldom repeated. Our author made frequent recourse to it, with complete success, he says, in diarrhœa, dysentery, in fever, the plague, and during pregnancy, in which cases it was nearly prohibited. Flatter'd with the success with which his practice was attended, he became, as he advanced in life, more and more bold and free in the use of the lancet, and has left records of cases, in which he bled his patients ten times, or oftener. He even recommends bleeding in quartan fevers, and in dropsy. The reputation the author acquired, soon procured him profecytes; and bleeding became a general remedy all over Europe; but in no country was it carried to such excesses as in France, where the profefors of medicine, for their too frequent recurrence to it, were held up to ridicule by Le Sage, in his imitable novel of Gil Blas. The mania has at length subsided; and bleeding is now considered by them as a valuable, but not as an universal remedy. The works of Botallus were collected, and published under the title of "Opera Omnia," in 1662, at Leyden, by J. V. Horne, Haller, Bib. Med. Præct. et Chirurg. Elyó, Bib. Hist.

3
BOTANIST, a person who understands the nature, history, and diffusion of vegetables, onitted and certain principles, and can draw every plant by a distinct, proper, and intelligible name. Linnæus Fundam. Botan. p. 1. See Botany.

BOTANOMANCY. formed of Botan and mancy, a species of ancient divination by means of plants, particularly face and fig-leaves. The persons who recurred to it, wrote their own name and their questions on leaves, which they exposed in the wind; and as many of the letters as remained in their own places, were taken up, and being joined together, contained the required answer.

BOTANOPHIL, among the writers on the subject of vegetables, those who have treated of them, not as botanists, or their natural and established distinctions, but in regard to different operations, as gardeners, physicians, &c.

BOTANY, is that branch of natural history which relates to what is usually called the vegetable kingdom, the second of the three grand subdivisions into which all terrestrial objects are divided. Its name, Botan, is the Greek word for grass, and is derived from the verb, Botan, which signifies to feed; because grass is the chief food of those animals which are most useful to man. By a process not understood in language, its meaning has been extended to the whole vegetable creation; and, by a familiar figure of speech, it is now employed to denote the natural history of plants.

Botany, as a science, is not confined to the description and classification of plants, as ignorance has often been pleased to represent it, but comprehends many other important particulars. Its various objects may be conveniently arranged under the following heads.

1. The terminology, or description and nomenclature of the several parts of a plant which are externally visible.

If all natural objects were simple in their form, it would not be easy to distinguish one from another; nor would it be possible to describe them, so as to give a clear and precise idea of them. Hence a boundless variety, connected with general resemblances, is widely and benevolently made their universal character. Every plant is composed of several parts, which differ from each other in their outward appearance, and which cannot fail to strike the most careless spectator. Many of them also are themselves compound, and are obviously capable of being divided into subordinate parts.

The first grand division, adopted by most botanists, is into the root; the body of the plant; and the fruitification. The last, or something equivalent to it, is essential to all plants; the first is visible in almost all; and the second is wanting in many.

The root is flatted by Linnæus to consist of the radicles, and the descending caudex. The radicle is that fibrous part which draws nourishment from the earth, and in many plants constitutes the whole of the root. The descending caudex is properly part of the flock, or body of the plant, which extends itself below the surface of the ground, as the ascending caudex rises above it. That the ascending and descending caudex have precisely the same nature is evident from the well-known fact, that if a young tree be infested, what was before the root will produce leaves, while the former item throws out radicles.

Roots are divided, according to the term of their duration, into annual, biennial, and perennial. The annual and biennial produce flowers and fruits only once, and then soon die; the former passing through all the stages of vegetable life in one season; the latter throwing out root leaves the first year, but not completing the fruitification till the next. The perennial root has within itself a principle of continued life, and gives being to new flowers and seeds, year after year, to an indefinite length of time. Of the roots that are called perennial, some are truly, others imperfectly such. In the true perennial root, the descending caudex and the radicle preserve the same individual organization, and increase in size as long as the plant continues to flourish. The imper-
successive generation. These individuals are not, indeed, exactly like each other in every minute respect; such a perfect conformity does not exist in any two individuals, either of animate or inanimate organized nature. But the difference between those of the same species, though sufficiently discernible by the eye, cannot easily be expressed in words. With a strongly marked resemblance in all their parts, there is a perpetual variation in their outline, and other particulars; so that no two individuals, lying one upon the other, will entirely correspond. They are formed after the same model, not cast in the same mould. In the general, an accurate description of all the parts belonging to any individual, will differentiate the whole species. There are, however, some sensible qualities of importance enough to be distinguished by proper names, which are, in many cases, too uncertain to enter into a specific character. Of these, size, colour, smoothness, or hairiness of surface, and luxuriance of one part at the expense of another, are the chief; and they are owing either to difference of soil, climate, particular exposure, and other accidents; or, to artificial cultivation, the most abundant source of perpetual varieties.

A genus is an assemblage of species, connected with each other by one or more common characters, but still preserving their specific distinctions.

An order is a similar assemblage of genera.

A class bears the same relation to its orders; and as it stands at the top of the series, it forms the most general and most widely diffused resemblances, and comprehends the greatest number of particular differences.

A natural arrangement of the species, genera, orders, and classes, size, in every instance, from heterogeneous combinations, and disturbing no real affinities, is the ne plus ultra of classification. It is a consummation devoutly to be wished; it is the point of perfection which every naturalist should labour to approach, though what no one can expect actually to reach. To have formed the idea is no small advance in the progress towards it, and implies a very considerable acquisition of knowledge.

Most of the systems which have hitherto been proposed, are professedly artificial; that is, founded on a few parts of a plant, with little or no regard to the rest. The calyx, the corolla, the sexual parts of the reproduction, and the mature fruit, have, each in their turn, been selected for this purpose by different systematic writers. A slight sketch of some of the principal systems will be found below in the history of botany, and a fuller explanation will be given, with critical remarks, under the article Classification. But, as the system of Linnaeus is that which has been adopted in this work, we shall now briefly illustrate its general principles.

In this system, the reproduction has been justly considered of the first consequence. The characters of the classes, orders, and genera, are accordingly taken entirely from it.

In the greater number of plants, the parts of reproduction may be distinctly discerned by the naked eye, or with the aid of a common lens; but there are also not a few in which they have not been satisfactorily discovered, or are too minute to be described with sufficient accuracy, for the purpose of systematic arrangement.

In most of those whole parts of reproduction have been clearly ascertained and distinctly described, the filaments and pistils are included within the same envelope; or, at least, are absolutely contiguous; but, in some, they are contained in separate flowers, or placed at a distance from each other. In both cases, there is much variety with respect to their number, position, and other circumstances.

On these distinctions the distribution into classes and orders is founded. The characters of the classes are taken exclu-
The twenty-fourth and last class comprehends all the plants which have inconspicuous flowers, and of which the fructification is consequently, in a great measure, unknown. It derives its name from κρυπτός, private, and γάμος, marriage.

The principles on which the classes are formed in the sexual system, will be distinctly seen in the following synoptic table:

SYNOPTIC TABLE OF THE LINNÆAN CLASSES.

|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|

After these twenty-four classes, the palms are placed in the way of appendix, because their fructification has not hitherto been sufficiently described.

By attending to these few simple and easy characters, the botanical student may readily find out under what class he is to look for any unknown plant, the name of which he is desirous to learn. He is next to inquire to which order of the classes it belongs.

The orders of the first thirteen classes are founded entirely on the number of the pistils; and are called monogynia, digynia, trigynia, &c. from γυνή, female, or wife, compounded, as in the names of the classes, with the Greek numerals. The

**BOTANY.**
flyles are to be counted from the base, and not from the upper part, which is often divided into two or more segments, without destroying the monotypous character of the flower. When the flyles are wanting, the number of stigmas determines the order.

In the classes didynamia and tetradynamia, none of the genera have more than one flyle; the characters of the orders are, therefore, taken from the pericarp. The clas didynamia has two orders; the first is distinguished by its naked seeds, inclufed, till ripe, in the permanent calyx instead of a pericarp. Its name, gymnosperma, is derived from γυμνός, naked, and σπέρμα, seed.

The second has its seeds in a pericarp, and is called angiosperma, from αέγγις, a vessel, and σπέρμα, seed.

The clas tetradynamia has also two orders, distinguished by the form of the pericarp; the first called siliculosa, from silicula, a little pod; the second, siliquosa, from siliqua, a pod. See Silicula, and Siliqua.

In the clas monadelphus, diadelphus, and polypelphus, the orders are denominated from the number of the flaments, triandria, pentandria, &c.

In the clas syngenesia, the orders are more complex.

They are fixed in number; the first five are distinguished by the epithet polygama, intimating that the flaments are compound, and consist of innumerable florets, or little flowers, seated on a common receptacle.

In the first order, polygama equinall, all the florets are equally possessed of flaments and pistils.

In the second, polygama superflius, the florets of the dish, or central part of the compound flower, have both flaments and pistils; those of the ray or circumference have only pistils, but the latter, as well as the former, produce fertile seeds.

In the third, polygama frustranea, the florets of the dish have both flaments and pistils; those of the ray, neither one nor the other, or only abortive pistils.

In the fourth, polygama necessaria, the florets of the ray have efficient flaments, but abortive pistils; those of the ray, fertile pistils impregnated by the flaments of the dish.

In the fifth, each floret has its own calyx, in addition to that which surrounds the common receptacle, and forms the whole into one compound flower.

The sixth differs from the rest in having only simple flowers, referred to this clas on account of the union of their anthers. It has been lately abolished by the general consent of botanists, and the plants formerly included in it have been referred to the clas pentandria.

In the clas monoecea and dioecea, the orders have the same names as the preceding clasfs, and are distinguished by the number of the flaments, or by the union either of the flaments or of the anthers, or by the attachment of the flaments to the pistil.

The orders of the twenty-third clasfs are denominated from the number of houses or plants on which the several kinds of flowers are found.

In the order monoecea, there are some flowers with flaments and pistils, and others that have either only flaments or only pistils on the same plant.

In the order dioecea, they are perfect, and only flaminiferus or perfect, and only pistiliferous flowers on two distinct individuals.

In the order trioecea, the different kinds of flowers are distributed among three distinct individual plants.

The clas cryptogramia is divided into four great families:

1. Filices, or ferns.
2. Mulcfsi, or mosses.

Vol. V.
The colours of plants are divided by Linnaeus into Hyaline, with the transparency either of water or of glass.
White, either cream-coloured or snowy.
Cinerous, either grey, livid, or lead-coloured.
Black, either dark or jet black.
Yellow, either sulphur, flame, or copper-coloured.
Red, either crimson, flesh-coloured, or scarlet.
Purple, more or less approaching to violet.
Green.

It is scarcely necessary to observe, that this enumeration is very imperfect. The different parts of plants have most commonly their appropriate colour. Roots and seeds are frequently black, the pericarp rarely, the corolla scarcely ever. The stem, the leaves, and the calyx are generally green, the corolla very seldom. The filaments and the pistil are often hyaline. The anthers are often yellow, as is also the corolla, especially in autumnal flowers. Vernal corollas and sweet berries are frequently white. Red is common in summer flowers, and labiate berries growing in the shade. Blue is not unfrequent in corollas.

The prismatic colours afford some fixed points of comparison in the description of colours; but there is no similar natural standard for the discrimination of colours and tints. However scanty and obscure the vocabulary of the former may be, that of the latter is, therefore, still more fo. The sense of smelling and the sense of taste have an evident and intimate connection with each other. Herbs and fruits that are grateful to the palate have almost always a pleasant smell; but the reverie does not equally hold; an agreeable perfume does not, in all cases, warrant the expectation of delicious food. Every plant has an odour and a flavour peculiar to itself, and differing from all others in kind as well as in strength. They are discriminated, according to the manner in which they affect the sense, by a few general expressions, which have little or no precise meaning.

Odures are,
Ambrosiac, or musky, as in sweet woodruff (asperula odorata) and musk geranium.
Fragrant, as in jessamine and violet.
Aromatic, as in cinnamon, saffrans, and cloves.
Unpleasantly strong, as in garlic and herb robert (geranium robertianum).

Stinking, as in elder (ebulus) and flanking may-weed (anchemis factida).
Nauseous, or disposing to vomit, as in hellebore, asarabace, and coloquintida.
Sharp, as in mustard.
Pain, as in primrose and lilac.
Tales are,
Sweet, as in sugar-cane and fig.
Acid, as in tamarin and lemon.
Fat, or oily, as in fresh almonds and olives.
Salt, as in saltola, and other maritime plants.
Bitter, as in wormwood.
Astringent, as in the fruit of the quince. This kind of taste is either astring, partaking of a little of the acid, as in unripe fruits, or acid, rough, partaking more of the bitter, as in the common floe.

Viscous, as in the fruit of the common jujube (rhamnus ciziphus). It produces only a slight sensation on the palate.

Acrid, as in garlic. It is sometimes caustic, as in the berrlics of daphne mezereum.
Dry and insipid, as in farinaceous seeds, and several kinds of bark.

Watery, as in cucumber and lettuce.
Naueous, as in tobacco.

Plants affect the touch, as they are feleshy or membranous, soft or harsh, smooth or rough, silky, hairy, or prickly, &c.

V. The anatomy of plants, or description of the different visible parts of which their substance is composed. There are,
1. The epidermis, or thin cuticle which invests the whole of the plant.
2. The cellular, or reticular substance, which appears in the young shoot of a tree after the epidermis is stripped off.
3. The fiber, inner or true bark.
4. The albumen, or biax, improperly called by English dealers in wood, the sap, a ring of imperfect wood between the bier and the true wood.
5. The lignum, or true wood, consisting of concentric firata or rings.
6. The phloem, a sapgy substance included in a longitudinal canal, which constitutes the innermost part of the plant.
7. The medullary produetions, or filaments proceeding from the pith, and enclosing the stem in a radiate direction, as far as the cellular substance.
8. The medullary appendices, filaments placed between the medullary productions, and reaching no farther than the wood.
9. The trachea, or air-vessels.
10. The sylevas, and
11. The vessels which secrete the peculiar juices of the plant.

VI. The physiology of plants.

A plant, like an animal, is a very compound, organized, living being, in which various operations, both chemical and mechanical, are continually going on, from its first production to its final dissolution. It springs from a seed fertilized by the pollen of its parent plant. It takes in foreign substances by its inhaling and absorbing vessels. It elaborates and assimilates to its own substance those parts of them that are nutritious, and throws off the rest. It secretes a variety of fluids by the means of glands, and other unknown organs. It gives that motion to its sap on which the continuance of its life depends. See the article Physiology of Plants, Vegetable, and Vegetation.

VII. The purposes to which different plants are applied, either as articles of food, ingredients in the composition of medicine, or materials and instruments in the useful and elegant arts; the soil and situation in which they are generally found, and which is most favourable to their growth; the time of the year in which they open their flowers, and ripen their fruit, with many other incidental particulars, are properly within the province of the botanist. But, as a botanist, he is concerned with nothing more than the simple facts. The best methods of cultivating such as are raised in considerable quantities for the special use or amusement of man; the theory of their nutritious or medicinal properties; and the manner in which they are to be prepared, so as to effect the intended purposes; are the province either of the farmer, the gardener, the physician, the chemist, or the artist. But as they cannot, in this work, be conveniently introduced under their respective sciences, they will generally be annexed to the botanical details of each particular plant.

VIII. The history of botany.

In all ages of the world, vegetables have been a principal article of human food. We can, therefore, scarcely doubt, that some intimations of the kinds which are most proper for this
this purpose, must have been given to our first parents by immediate revelation from their Creator. Such intimations, however, would be no more than was absolutely necessary, to prevent them from dying by famine, on the one hand, or by the deleterious effects of poisonous plants on the other. They would extend only to a few salutary roots, herbs, and fruits; and agreeably to the general economy of human life, all farther acquisitions in knowledge would be the result of occasional experiments and slow experience. A knowledge of the various species would then gradually increase, and some general distributions would spontaneously offer themselves to notice. A woody trunk would soon be distinguished from an herbaceous stem. A tree and a shrub, an annual and a perennial herb, would not long be confounded with each other. The most striking differences in the form and consistence of the fruit would also be readily observed. Mofes, as appears from the first chapter of Genesis, was acquainted with three characteristic divisions: fruits, of which the seed was probably for some time overlooked or disregarded; herbs, which bear their seed in a dry pericarp or feed veiled; and trees, with all other vegetables, which have their seed inclosed in a pulpy or fome other eatable substance. And it is worthy of remark, that in the grant of vegetables to man for the purpose of food, only the two latter are mentioned; the flint being reserved for "the beasts of the earth, and the fowls of the air, and every thing that creepeth on the earth." Among these a selection would soon be made of such as were most grateful to the palate, and the other leaves. Whatever were the Dudaim which Rachel begged of the fons of Leah, and which our translators have absurdly rendered mandrakes, it is certain, from the song of Solomon, that they were a kind of fruit which gave a pleasant smell. Solomon is celebrated for his knowledge of plants; but all that we know of it, is, that he spake of them from the cedar of Lebanon to the hyssop that groweth on the wall. It could not, moreover, be very long before the early race of mankind began to perceive that some vegetable productions are mildly nutritious, and others actively medicinal. In the frequent search after new viands, which the reliefs curiosity and craving desire of diversified gratification, natural to man, would induce him to make, he would find some that produced violent effects on his bodily frame, and relieved or removed disorders, which are always the "soures of pain, and often the forerunners of death." This would give a new direction to his inquiries, and perhaps prepare the vegetable creation to him in a more interesting point of view. Pain is, in all cafes, so difficult to be borne, that whatever promises to diminish it, is sought for with unwearied affinity.

The knowledge of medicinal plants was, therefore, regarded as a highly valuable attainment many ages before plants themselves were made the subjects of a distinct science. Botany long continued the humble but engaging handmaid of surgery and medicine. The balm of Gilead bore a high price in the estimation of a Jew, because it was strong and rapidly associated with the idea of a physician. In Homer, Patroclus launces the bleeding wound of Euryphylus with the juice of a bitter root, the virtues of which he had learned from Achilles, and Achilles from Chiron. The power of the moly, used as an internal antidote against the incantations of witchcraft, is likewise celebrated by the same poet; and the knowledge of it is said to have been owing to the intervention of a god. That great honour was obtained by an acquaintance with the medical properties of plants, in the heroic ages, is evident from the encomium given to the wife of one of the heroes whom Nestor boasts of having lain in his youth:

"If to the feet of my dear wife we are given life,"

"Who knew the virtues of each earth-born herb."

At a much later period, we shall search in vain for any information concerning the botany of the ancients, except in their medical writers. Hippocrates, the oldest of those of whom we have any remains, and who flourished at the beginning of the Peloponnesian war, of course makes mention of the plants which were then employed in the cure of diseases; but he gives only their names, with their real or supposed fanatical qualities. Aritolotte, who lived about half a century after, and whose comprehensive genius left fearfully anything unexplored, could not overlook so obvious and attractive a pursuit: but the two books now existing which bear his name, are of such inferior merit, that they are generally thought to be forgeries. Theophrastus, the disciple of Aritolotte, is the first professed writer on plants, whose works have incontestibly defended to modern times. He was acquainted with about five hundred, and has left descriptions of them, with light philosophical sketches relating to some of their most prominent dilhinations. But his descriptions are so vague and imperfect, that, in most cases, it is difficult, in many impollible, to determine what plant he intended. And he has made only a rude attempt to divide them into grand families, either by their size and texture, as trees, shrubs, and herbaceous plants, or by the uses to which they were then commonly applied.

From the age of Theophrastus to that of Dioscorides and Pliny, there is an interval of 400 years. Dioscorides was a physician, and wrote entirely as such. He has enumerated about 900 plants; but his account of them is so brief and indeterminate, that, in a botanical view, they are of little value. Nor, in this respect, is Pliny entitled to much greater praise.

During the dark ages which succeeded the downfall of the western empire, almost all the knowledge on this side of the Indus was confined to the courts of the Mahometan caliphs. The Arabian and Moariph physicians cultivated the art of medicine with no inconceivable degree of success, and translated the best Greek writers on the subject into their own language. But in the investigation of plants, they were not much, if at all, superior to their masters. We are, however, indebted to them for the knowledge of fenna, callia filula, manna, tamarinds, rhubarb, and some other medical drugs, which still keep a place in the Materna Medica.

At the revival of literature in the west, the ancients were truly considered as the depositaries of nearly all the knowledge that then existed. It seemed, therefore, as necessary as it was natural, that their writings should, for a time, be exclusively studied. For what steps towards a further progress could be advantageously taken, till what was already done was clearly ascertained? As a general idea, it was a good one; but its application to natural history was unfortunate. For in this branch of knowledge the ancients had done nothing to much purpose. The lovers of botany, however, buoyed up by vain expectations, devoted themselves diligently to the study of Theophrastus, Dioscorides, and Pliny; and much time was idly spent in endeavouring to find, on the west of the Adriatic, all the plants which have been mentioned by those authors. Commentators succeeded commentators; conjecture superseded conjecture; till at length a few intelligent minds, weary of fruitless attempts, perceived the folly of floundering a science in the imperfect remains of two dead languages; when they might have free access to the fair and legible characters of a book always open, and inviting their regard by incontestible marks of unwerring knowledge and wisdom.

N 2  German.
Gefner, in particular, the greatest naturalist whom the world had seen since the days of Aristotle, cultivated both zoology and botany, with a zeal which has never been surpassed; with a discernment and good sense which till then had never been known. He has the glory of having first discovered the experience of dividing plants into classes, genera, and species, and the necessity of taking the distinguishing characters of each division from the flower and fruit. He died of the plague in 1574; at the early age of fifty.

Gefner, who was his contemporary, and many years his survivor, engaged in the study of plants with equal ardour, but not with equal talents for just arrangement. He distributed them chiefly according to their size, their general habit, and their other salient qualities.

At this time also flourished Dr. William Turner, who may be accounted the father of English botany. It was he who first gave names to many English plants; and much praise is indisputable due to him for his diligence in examining, and judgment in discriminating, different species: but with respect to arrangement, he was far inferior even to Clusius; for he has dispersed his plants in the alphabetical order of their Latin names. The first part of his Herbal was printed at London in 1551; the second at Colonia, 1562; and the third, dated Welles, in 1564. It is in the black letter; and contains figures of most of the plants.

In the same period lived Dodonaeus, or Dodonos, who began to publish in 1552; and in 1583 collected all his works into one volume, which he quaintly called, "Stirpium Historiae Sex Pentades," because each larger division consists of five books.

This work is the foundation of Gerard's Herbal, so well known in England, and so long regarded as a standard book by the merely English botanical student. It was published in 1597, and comprises the whole vegetable kingdom in three books. The first contains the grasses, grain, rushes, reeds, flags, and bulbous-rooted plants; and exhibits a remarkable approximation to the arrangement of a very modern system, founded on natural affinities. It was suggested, however, by a regard not to the monocotyledonous character of the seeds, but to the simplicity and general form of the leaves. The second includes all herbs used for food, for medicine, or for their beauty and elegance. The third is a miscellany of trees, shrubs, fruit-bearing plants, roots, gums, resins, heaths, mosses, lichens, and sea-plants.

It was left to the judgment of Celsalpin to begin to execute what the penetrating mind of Gefner had first conceived; the arrangement of the whole vegetable creation in a regular system. His distinctive characters are taken from the different appearances of the flower, sometimes modified by the consideration of other parts; and though it cannot boast of being the bell in theory, or the most easy in practice, it poises great merit as the first essay in a difficult and important undertaking. Celsalpin is particularly worthy of regard, as the first writer who has distinctly mentioned the true difference of sexes in plants. He died in 1604.

The last of the writers of this period are the two Bauhins. John, the elder, was the friend of Gefner, and travelled with him into Italy; but, though ardent in his love of plants, he had no turn for systematic arrangement, and added nothing to botany, considered as a science. He wrote a general history of plants, which was published in three folio volumes, but not till 1650, 27 years after his death.

Gaspard, his brother, was much his junior in years, but far exceeded him in the greatness of his conceptions, and the extent of his services to their favourite pursuit. The publication of his "Piazz Theatri Botanici," in 1625, makes a new era in botany. This immense work, the fruit of forty years' labour, threw over the subject, as it then stood, a clear and conspicuous light, and threw at one view the information which had been given by a multitude of scattered authors. It afforded a ruling-place, a kind of fixed point, from which new excursions were to be made, and new achievements were to be attempted. But though he smoothed and shorted the way for others, it must be acknowledged of him, as well as of his brother, that he added little to what had already been done.

Many accession were soon after made to the number of known plants, by the labours of Pons and Zanoni in Italy, of Johnsson and Parkinson in England, of Hernandez, Pison, and Marcgrave in South America, and above all, of Rheede, who, in his "Hortus Malabaricus," brought to light about 800 plants, natives of the East Indies. But botany, as a science, made little progress for nearly half a century; when Morison, Ray, Rivinus, and Tournefort, all nearly at the same time, directed their attention to the classification of plants, and investigated the true principles on which it ought to be formed. Morison, in a second edition of Bruyn's "Hortus Regius Bieferis," published at Paris in 1669, gave the rudiments of an arrangement, founded on the fruit; and also asserted, that the characters of the genera should be taken from the same part: but in his history of plants, printed at Oxford in 1650, he did not strictly adhere to his own principle. His system was quickly succeeded, and its fame nearly eclipsed, by that of the immortal Ray, the outlines of which were first given, in 1682, in the "Methodus plantarum nova fysipotize in tabulis exhibita: cum notis generum tum ssummarum tum subalternor um characteristicis." The principal aim of this great naturalist was to preserve the natural families of plants, as they are connected by a sameness of structure and general habit. Influenced by the latter consideration, he retained the ancient division of the vegetable kingdom into trees, shrubs, and herbaceous plants; making no alteration, except in classing with the latter what are generally called succulents or under-shrubs. This system he afterwards improved and brought nearer to a natural arrangement; but he still left the characters of his genera in a great degree indeterminate, and governed by no fixed principle. The time was not yet come for taking this further step towards the perfection of the science.

The classification of Rivinus, derived from the structure of the corolla, was first made known to the world in 1650. It is more easy in practice than either of the former, but does more violence to the order of nature. It must, however, be mentioned, to his honour, that he was the first who perceived the propriety of not separating trees from herbaceous plants. They are accordingly blended together in different parts of his system.

As Morison soon yielded in celebrity to Ray, so Rivinus gave way to Tournefort, the glory of France, and equalled only by Ray, the glory of England. His elements of botany, in which the primary divisions are taken from the corolla, and the secondary ones from the fruit, were published in 1694. His arrangement, indeed, is not unexceptionable in all its parts, but its imperfections were from the defects of his principle; and though he did not define his genera in plain and appropriate terms, it is evident that he had formed just ideas of them in his own mind.

The fame of these two great men, who had done so much in promoting the progress of true scientific botany, obstructed, for a considerable time, its farther advancement. It was vain for botanists to contend, either in England or France,
France, with the established reputation and authority of their respectively favoured countryman. Several other systems were formed about the same time, among whom Boerhaave in particular had great merit; but none of them found many proteytes, or could boast of long duration. The first publications of Linnaeus made their way slowly, and with much difficulty. In England, so late as the year 1762, Mr. Hudson was the first who published a national Flora, arranged on the principles of the Linnean system. In France, owing to the personal antipathy of Buffon, the ideas of the learned Swede met with much greater and more pointed opposition: but they found an early advocate in the duke de Noailles; and, in 1765, the classification was adopted in the "Flora Montisplicia," of professor Gouan.

The distinction of sexual parts in plants had been discovered, and pretty generally admitted, before the time of Linnaeus; but he was the first who made it the basis of an artificial system. The first sketch of his "Systema Naturae" was published in 1735; and the "Fundamenta Botanica," in 1736. In 1737 they were followed by the "Critica Botanica," "Genera Plantarum," "Hortus Clifortianus," "Flora Lapponica," and "Methodus Sexualis." In 1751 appeared his great and most finished elementary work, the "Philosophia Botanica," and in 1753, the first edition of the "Species Plantarum," which completed his system, by extending it to the lowest division under which individual plants are collectively arranged. In his "Genera Plantarum," he had given a distinctive and precise generic characters, which they had never before received; and in this last publication he conferred the same obligation on the species; with the addition of trivial names, consisting of a single word, instead of the tedious specific names, as they were called, by which the conversion of botanists had till then been burdened and embarrassed. This innovation was at first violently condemned by a few disciples of the old schools, from an apprehension that it would be unfavourable to the recollection of specific distinctions; but its obvious convenience has long gained it universal currency.

Notwithstanding the supertative merit of Linnaeus, he found a rival and an opponent in Switzerland, as well as in France. The mighty genius of Haller could not condescend to walk in the trammels of another man. In his history of the plants of Switzerland, fixed by the very able and judicious president of the Linnean society, one of the most excellent and complete Flora the world ever saw, he has adopted a method depending chiefly on the number of the flaments, combined with the divisions of the corolla. But his system is now little talked of, and lefts fluided.

Linnaeus devoted the greatest part of his life to the construction and completion of a system confidedly artificial; but he was nevertheless fully capable, that the perfection of the science requires an arrangement founded solely on natural affinities. The idea of such an arrangement had been conceived, and partly executed, by several of his predecessors. The improved system of Ray, in particular, is a noble essay towards reducing the whole vegetable creation into fixed natural families. All other distributions are only proofs of the present defective state of knowledge, and are to be employed merely as helps for the attainment of a consummate system. Linnaeus has accordingly left what he calls fragments of a natural order, without pointing out their peculiar distinguishing characters; and the sublimits of his varieties have not been published, since his death, by his pupil Giscke, in which the omission is, in some degree, remedied; though, at the same time, it is strenuously maintained, that such characters as shall be at once completely comprehensive, and exclusively discriminating, are, in the nature of things, absolutely impossible.

Adamfon, a French traveller in Africa, has also attempted to form natural families of plants, not from the consideration of any particular part, but of all, without exception, from the root to the feed. But, independent of a multitude of other objections, it labours under the infuperable impediment of having the distinctive characters of each family drawn out to the length of times of four or five pages, without being capable of an abridgment.

The most successful attempt of this kind is that of Anthony Lawrence de Jussieu, the illustrious nephew of three illustrious brothers, who have been all distinguished for their attachment to botany, and for their eminent services to it. The outlines of this system were struck out by Bernard de Jussieu, demonstrator in the royal gardens at Paris; but owe their present more mature form to the skill and persevering application of his nephew, who succeeded him in his office. It is founded first on the number of the coryledons of the seed; next, on the insertion of the flaments with respect to the pistil, whether immediately on the receptacle, the calyx, or the pistil itself; or meditately, by the means of the corolla, similarly situated; and so on, from the essential to the non-essential, from the more to the less important parts, in a descending progression, to such as are the most variable and of the least value.

A methodical disposition of plants, from the character of the fruit, has lately been published by Gartner, a German botanist, who has laboured in this essential part with greater diligence and accuracy than any other writer.

But notwithstanding the acknowledged merit of these essays, the Linnean still continues the prevailing system, to which all the new genera, confituted for plants since discovered, are regularly referred; and it is to the advantage of the science, that it should, for a long time yet to come, preserve its ascendency. It is capable, indeed, of many improvements; but such improvements should be slowly and cautiously proposed, always keeping in view an approximation to a natural order. Most of the projects which have hitherto been formed for this purpose, betray more rashness than acute discernment, more love of innovation than capacity for removing real imperfections. While they seem to acquire greater simplicity, they become actually more artificial, and more violently destroy the connection of natural affinities. The deficiencies of the respectable Thunberg have not been generally admitted; the additional ones of Gmelin have been almost universally condemned; and Wildenow, the last and belter editor of the Species Plantarum, has restored all the ejected classes. Dr. Smith, with his usual judgment, has only expunged the order monogamia from the class fycngenetrix, and retained in the class polygamia only such plants as have an essential difference in the structure of their perfect and imperfect flowers.

See the article Classification of Plants, where the different systems will be detailed and examined. See also the Biblioteca Botanica both of Linnaeus and of Haller; La Marec's Preliminary Dicentro to the Botanical Part of the French Encyclopædia; Dr. Smith's Introductory Address to the Linnean Society; Dr. Pulteney's View of the Writings of Linnaeus; and his Sketches of the Progress of Botany in England.

Botany Bay, in Geography, a capacious bay on the eastern coast of New Holland, so called by captain Cook, who anchored there on the 20th of April 1770, from the great number of plants which were found in its vicinity by sir Joseph (then Mr.) Banks, and Dr. Solander. The land on the sea-coast is moderately high, and nearly level, but in general
general higher than it is in the interior parts, and covered with steep rocky cliffs near the sea, which resemble a long island lying close under the shore. The harbour lies about the middle of this land; and, in approaching it from the south, is discovered before the ship comes abreast of it; but from the north it is not discovered so soon. About the head of the harbour, there are large banks of sand and mud, on which are great plenty of water-fowl, and large quantities of oysters, mussels, cockles, and other shell-fish, which supply the natives, who gather them by means of their little canoes in flood-water, with the principal means of their subsistence.

From the report of Cook, who carefully examined this coast, and took possession of it in the name of the king of Great Britain, it was thought to be a desirable situation for a settlement; and accordingly it was proposed, at the close of the American war, to transport felons thither, who were sentenced to this kind of punishment. This plan was adopted in 1786; and the first ship sailed from Spithead in January, 1787, and arrived thither in the same month of the following year. It appeared, however, from the report of Cook and other navigators, that it was subject to the inconvenience of a great scarcity of water, and on the arrival of the first settlers, that it afforded advantages for the establishment of a colony much inferior to such as they expected to find; the soil being swampy, water-feece, and the bay itself inconvenient for shipping, on account of the shallowness of the water, and its exposure to the easterly winds; and it was therefore resolved by governor Phillip to transfer it to another inlet, about 12 miles farther to the north, called Port Jackson, on the south side of which, on a spot called Sidney Cove, this settlement is now fixed.

For a further account of the settlement, and of the country, see New Holland.

Two French ships, called the Allorob and Bouffolc, which left France, on a voyage of discovery, under the command of M. la Peyrouse, in 1785, arrived in this bay in the beginning of the year 1788; and during their stay, father La Reveur, who had come out in the Allorob, as a naturalist, died of the wounds he had received in a conflict with the inhabitants of Matuna, one of the Isles des Navigateurs, at which they touched. A monument, bearing an inscription, was erected to his memory, but was soon destroyed by the natives. But governor Phillip caused the inscription to be engraved on copper, and nailed to an adjacent tree.

Botany bay lies in S. lat. 34° 56', and E. long. 151° 57'.

Botany Island, an island in the Southern Pacific ocean, near the coast of New Caledonia; so called by Captain Cook from the number and variety of plants it afforded. S. lat. 22° 26' 40'; E. long. 167° 16' 45'.

Botargo, a sort of caponage, made of the milts and roes of the mullet-fish, much used on the coast of the Mediterranean, as an incentive to drink. The manner of preparing botargo, as practised at Martegues in Provence, is described by Mr. Ray. The milts, nigcles, are taken in "burdiges," which are places in the shallows inclosed with hedges of reeds. The male millets are called "allactons," the female "boters," of the roes or spaw of which the botargo is made thus:—They first take out the spawn entire, and cover it round with salt for four or five hours; then they press it a little between two boards or flumes; then they wash it, and at last dry it in the sun for thirteen or fourteen days, taking it in at night. Ray Trav. p. 356, seq.

The method of making the botargo, in the towns of Koflow and Kaffa, in Cim Tartary, on the coast of the Black Sea, where the mullet abound, is as follows:—Immediately after the fin spawns, the spawn is put whole into a strong brine, and slightly immersed; when it is thought to be sufficiently done, it is put into pots, and covered with melted wax, to prevent it from spoiling; and it will then keep for a long while, and may be conveyed to very distant countries.

The people of Provence call it bow-argues. The best is brought from Alexandria and Tunis. There is also a manufacture of it near Marsills. It is much used throughout all the Levant, and usually eaten with olive-oil and lemon-juice.

Botarissas, Strinhas, See Botarissas, Bell Ag., one of the synonyms of gadaa botaa, called also claria fluminis, by the same author; by the English, cod-pot, or turbot. See Lotta, Gauda.

Botatrice, in botany, synonymous with botarissas, cod-pot, and gadaa botaa. See Botarissas, and Lotta.

Botaurus, in ornithology, a species of Ardea, with a smooth black head; body above circular and fuscous, variegated; beneath rufous; lore and orbits naked and yellow; throat white, streaked with black, and reddish. Gmel.

This is botaurus major of Brillou and grand bataur of Buffon; greater speckled, or red heron of Ray and Willughby; greater bittern of Latham.

Ardea botaurus is a native of Italy; length three feet nine inches; the bill is yellowish; irides yellow; feathers on the head and breast long and flowing.

Bote, Bota, in our old Law-Books, signifies compensation, satisfaction, or amends, for any injury done. See Botovers.

Hence man-bote, satisfaction due for a man slain. In king Ino's laws it is declared what was the rate ordained for this offence, according to the quality of the person slain.

Hence also batelets (charter of Hen. I. to Thomas archbishop of York), where no judgment or favour will acquit a man; as, v. gr. for faiteges, &c. And hence our common phrase to bote, speaking of something given by way of compensation.

Bote, cart, fire-bote, hay-bote, house-bote, kin-bote, plough-bote, fife-bote. See the adjectives.

Bote fleux, in Gunneria, are flits two or three feet long, and an inch thick, split at one extremity, to hold an end of the match twinned round it, for firing the cannon.

Botenmalaitos, a star in the constellation Cetus, called also Battenehos.

Boternhofen, in Geography, a town of Germany, in the duchy of Holstein, 9 miles S.S.W. of Norderp.

Boterola, in heraldry, is the tag of a broad-foiled scabbard, and by the French heralds esteemed an honourable bearing.

Botervigie van Boer, in Zoology, (Connus gulae, Linne) is described under this name by Kupplius.

Botescard, in Ancient English Writers, the same with bovetain.

Botesdale, in Geography, a market-town of Suffolk, in England, is seated near the borders of Norfolk, on the turnpike road which leads from that place to Bury St. Edmunds. It was formerly called Botolph's-Dale, from a chapel dedicated to that saint in a valley. This faced structure had long continued in a state of dilapidation, but Thomas Holt esq. and some neighbouring gentlemen, raised a subscription, and had it properly repaired and fitted up for its original dedication. This town enjoys the advantage of a free grammar school, which was founded and endowed by the eminence Sir Nicholas Bacon, who was created the first baronet of England. He also bequeathed other legacies to the town; and the school has been since enriched by the donations of other persons. Botesdale is annexed to the rectory of Redgrave, the church of which is highly interesting to the hibertian and antiquary, from its including the monuments and remains.
remains of Sir Nicholas Bacon and his lady, also another magnificent one for lord chief justice Holt. The latter is said to have cost £300, and the former (executed by Nicholas Stone) £500. Both these illustrious men were successively poiffessed of the lordship of Reighgrave, where the abbot of Dury had previously "his fairest country-Seat." The fine old manor has been succeeded by a modern building; and the place, now poiffessed by a descendant of chief justice Holt, is considered "one of the finest in the county" of Suffolk.

Bothfield has a weekly market on Thursday, and two annual fairs. It contains only 65 houses, and 536 inhabitants, of which number 222 are employed in manufactures. From Norwich it is 27 miles, and from London 86 miles N.E. Gaugh's Camden, vol. ii. Magna Britannia, vol. iv.

BOTEY'OURT, one of the American counties in the state of Virginia, situated between the Alleghany and Blue ridges; its chief town is Fincastle.

BOTH, John, in Biography, an eminent landscape painter, was born at Utrecht in 1610, and, after having been the disciple of Abraham Bloemaert, went for improvement to Rome, where he resided many years; directing his attention to landscape, in which he attained to high perfection. His model was the style of Claude Lorraine; and some of his performances are mentioned in competition with those of Claude. The warmth of his Stites, the judicious and regular receding of the objects, and the sweetness of his diffusions, afford a pleasure superior to that produced by the works of almost any other artist. His tints are so admirably formed as to express not only the light of the morning breaking from behind hills and woods, and diffusing a warm glow over the whole face of nature, and also the setting of the sun with its tinge in the clouds, but even the different hours of the day. By his colouring he obtained the distinction of being called "Both of Italy." We have also by his hand a set of ten landscapes, which are etched in a light, free, masterly style. He left his life by accidentally falling into a canal at Venice in 1650. Pilkington and Strutt.

Both, Andrew, brother of the former, and disciple of Bloemaert, accompanied him to Rome, and applied to the study of figures, in which he imitated the style of Bamboccio with great success. The two brothers mutually assisted each other till the death of John; and then Andrew returned to his own country, where he painted sometimes portraits, and sometimes landscapes, in the manner of his brother, and also conversations, and players at cards, in the manner of Bamboccio; and where he died in 1656. Andrew Both also etched some few plates in a free, masterly style, resembling that of Oltade, viz. six small upright plates of "Dutch merry-making," to which he affixed his name; "St. Anthony praying with a scull before him," and "St. Francis with a crucifix before him," his companion. Pilkington and Strutt.

Both, in Geography, a river of Germany, in the circle of Bavaria, which runs into the Inn, near Scherding.

Botha's, off, in Sea Language, expresses the situation of a ship failing right before the wind.

Bothagium, Bothage, or Boothage, customary due to the lord of the market, for the liberty of pitching and landing of boats.

Bothena, Bothina, or Bothina, in the Scotch Law, a park or field wherein cattle are inclosed, and fed. The word is also written burden; formed from the ancient Scottish buth, a flock of sheep.

Bothena is also used for a barony, lordship, or shireedom. In which sense it is ordained by statute, that the king's moot or court of each bothena, that is, each shireedom, shall be held within forty days.

Bothfield, in Geography, a district of Germany, in the buitwick of Calculberg, containing of five villages, of which Bothfield is parochial.

Bothmar, a county of Germany, in the principality of Zell, and 7 leagues W. of it; situated on the Rhine.

Bothnia, East, Ofer-botten, Lat. Ofro-bottonia, a province of Sweden, situated on the east side of the gulf of Bothnia, whence it derives its name, is bounded on the north by Swedish Lapland, on the east by Raflia, on the south by Finland, to which it properly belongs, and on the west by the gulf of Bothnia. Its extent has not been accurately ascertained; for some it has been computed to be about 50 Swedish miles long, and 40 broad; and by others its length has been estimated at 66 Swedish miles, and its breadth at 12. It is separated from Raflia and Finland, properly so called, by a chain of hills, which runs along its call side. These mountains supply large rivers, of which some discharge themselves into the White Sea, and others into the gulf of Bothnia and Finland. The country, especially on the sea coast towards the south, is low and marshy; however, the industry of the inhabitants has made it productive of corn, though the cold and frost often disappoint their hopes, and several tracts of land he waste. It abounds with wood, and its lakes and rivers yield plenty of fish. Some of the rivers are said to have furnished pearls. The inhabitants derive their chief subsistence from agriculture, grazing, burning lime and tiles, and making pitch and tar. They also employ themselves in fishing and hunting, ship-building, and the manufacture of wooden-ware. Those who inhabit the rocky islands near the sea-coast speak the Swedish language, but those of the inland parts use that of Finland. The number of inhabitants is estimated at about 80,000, who are scattered over 28 parishes, 15 of which are occupied by Finns, and nine by Swedes, and which are under the jurisdiction of the bishop of Abo. The commodities furnished by this country for exportation are timber, butter, cattle, fish, oil, pitch, tar, &c. East Bothnia is divided into three parts or lehns, which are under one governor. Its chief towns are Cajana or Cajaneborg, Utsa, Brahehall, Gemla-Carkby, Ny-Carlby, Jacobiack, Wafa, and Chriflineflett.

Bothnia, West, a province of Sweden, lying on the west side of the gulf of Bothnia, and bounded on the north and west by Lapland, on the south by Angermanland, and on the east by the gulf of Bothnia. That part of this province which is inhabited extends from the frontiers of Angermanland to the church of upper Torna, and is computed to be about 58 Swedish miles in length, and from 16 to 18 miles in breadth. Off the coast of this province are several pleasant islands, and its interior has several forests, with lakes and rivers. It has also excellent pastures among the mountains, the summit of which supplies the rein-deer with moss. The soil is tolerably fertile, and produces corn, which is sown late, and ripens in six, seven, or eight weeks, but which is often injured by the sudden frosts of July. This province has several mines of copper and iron. The inhabitants are celebrated for their hardiness and valor; they supply the agriculture, grazing, hunting, and fishing; and even in fruitful years mix their corn with chaff and pulverized pine bark, with which they make their "flame-bott," or pounded bread. They traffick in beams, deal-boards, and other timber, shingles, tar, tallow and smoke-dried salmon and other fish, wild fowl, venison, common train-oil, tallow, butter, and cheese; and also in fables, and skilis of blue and white foxes, ermines, bears, wolves, martens, hyenas, beavers, and rein-deer. These commodities are carried by them, not only to other parts of Sweden,
Sweden, but over the mountains to Norway, and through extensive defiles to Russia. It is divided into four vogues or inferior governments, contains two provincial juridictions, and, with regard to its ecclesiastical date, belongs to the see of Hernaland. The principal towns are Umea, Pitea, Lulea, and Tornoe.

Botnia, gulf of, one of the branches into which the Baltic is divided; the other being the gulf of Finland. The former is separated from the Baltic by the isles of Aland, is bounded on the east, west, and north by the Swedish dominions, and extends between them, from Aland to Tornoe, about five degrees and a half in latitude, or about 179 leagues from north to south, and from 18 to 35 in breadth from east to west.

Bothnicus, in Entomology, a species of Cryptothalus, Chryseola botanica of Linnaeus. The colour is deep black, with a longitudinal red line on the thorax. Inhabits Sweden.

Bothoa, or Bothus, in Geography, a town of France in the department of the north coast, and chief place of a canton, in the district of Guingamp; the place contains 2021, and the canton 7554 inhabitants; the territory comprehends 207½ kilometres, and 8 communies.

Bothwell, an ancient barony and parish of Scotland, which includes an area of about 85 miles in length by 4 miles in breadth. The bridge in this parish, which crosses the Clyde river, is memorable for an engagement fought on the south side of it, June 23, 1659, between the royalists, under the duke of Monmouth, and the presbyterian insurgents. In this fatal conflict the latter were defeated, with the loss of 400 slain, and 1200 taken prisoners. Here are the remains of a castle, which appears to have been formerly of very large dimensions. It is frequently mentioned in the annals of Scottish history. Sir John Sinclair's Statistical Account, vol. xvi.

Both, in Geography, a town of Siberia; 32 miles S. of Orkhang. Also, a town of Siberia, 76 miles N. E. of Nertsehik.

Bothicum, in Ancient Geography, a town of Asia Minor, in Phrygia, which had a market that produced salt. Steph. Byz.

Bothias, a name given in Spain to a smaller sort of alcarras, or vessels used for cooling water; the larger sort being called jarras. See Alcarras.

Bothstemeni, in Geography, the name of a mountain in the southern part of the island of Madagascar.

Bothian, Al Mokhtar Ben Hassan, Ben Aboun, or D'Ern Bothian, in Biography, a Christian physician of Bagdat, the contemporary and antagonist of Ibn Rodwan. It is said that Bothan, in order to be personally acquainted with his adversary, made a voyage into Egypt, A.D. 1047. On leaving Egypt, he went to Conflantinople, where he lived a year. He is the author of the following works, viz. "Kenash," or a compendium of medicine, for the use of the convents; "Instructions how to buy slaves, and to make profit of them;" "Tables of health;" "Of the diseases of physicians;" "Introduction to the art of medicine;" "Devat et athebba;" or the religion of physicians; and "Of the cure of a child who had the stone." D'Herbelot.

Bothna, or Kavzen, in Geography, a river of European Turkey, which runs into the Dnieper, near Benders.

Bothol, or Botol Tabuya-xima, Taboza-xima, or Tabazo-Sinya, the name of two islands in the Chinese seas, situated at the distance of about 5 leagues from the south point of Formosa, and on the same parallel. The great island, at its south-east point, is placed, by captain Marchand, in N. lat. 22° 5', and E. long. 121° 34'; by Dalrymple's chart, in N. lat. 22° 6', E. long. 121° 50'; by La Pérouse, in N. lat. 21° 57', E. long. 121° 52'; by Chamal, in N. lat. 22° 5', E. long. 121° 54'; and by G. Robertson, in his table of positions, in N. lat. 22° 6', E. long. 121° 41' 45". This island is sufficiently elevated to be seen at a distance of 15 leagues, when the sky is clear; it is about 4 or 5 leagues in circumference; and it is well peopled with inhabitants, as Marchand observed fires blazing during the night; and La Pérouse, on approaching very near to it, distinguished three extensive villages within the space of a league. It is very woody from about one-third of its elevation, taken between the water's edge and its summit, which appeared to be crowned with trees of the largest size. The declivity of the space between these forests and the beach is very rapid. It was covered, says La Pérouse, with the most beautiful verdure, and in many places cultivated, though arrowed by the torrents that descend from the mountains. The small island of the same name, the only one, probably observed by lord Anson, the other being very often covered with fogs, lies to the south by east of the great one, in N. lat. 21° 57', and E. long. 121° 50', on the same parallel with the middle of the great island, according to Dalrymple's chart; but on the parallel of its south-east point, according to that of La Pérouse. It is somewhat less elevated than the larger island, (not half so high, says La Pérouse,) but, however, sufficiently lofty to be seen at the distance of 10 or 12 leagues. These two islands are separated by a channel half a league in width; and both shores, as well as the channel, appeared to Marchand, equally free from rocks or islets. On the small island La Pérouse perceived some little verdure and a few bushes; but he says, that it is neither inhabited nor habitable. He adds, that if there be any anchorage at the great island, it is extremely near the coast. Marchand's Voyage, vol. ii. p. 60. La Pérouse's Voyage round the World, vol. iv. p. 9. Eng. Ed.

Botone, in Heraldry. See Cross Botone.

Botontini, in Middle Age Writers, denotes mount or hillocks, raised to serve as land-marks, or boundaries of grounds. The word is also written botontone, botone, and botones. Du-Cange Gloss. Lat.

Bototo, in Ornithology, a name given by the people of the Philippine islands to a beautiful bird of the parrot kind, but of what species is rather uncertain. It is described as being smaller than the common parrot, and the plumage totally of a fine blue colour. It agrees with the blue parakeet of Othoheite, Pittacus Cyanus, and may very possibly be the same.

Botovskai, in Geography, a town of Russian Tartary; 20 miles S. S. W. of Koperik.

There is only one species known, which is a climbing shrub, with scattered heart-shaped, three or five-lobed, veined, crenulated, villose leaves; and small reddish flowers on common axillary peduncles, which terminate in tendrils. It is found on the coast of Zanguebar, where it is esteemed a diuretic. Its berries are eaten; and a decoction of its root is given in cases of pleurisy, inflammation, and abscess.

Botro, in Geography. See Bourtos.

Botrodus, in Ancient Geography, a place of Spain in Celtiberia, mentioned by Marius in his epigrams.

Botrites, in Natural History, a stone of the gem kind,
kind, resembling a branch of young grapes. The word is formed from οἶνος, a grape. In English writers, it is sometimes called the grape-juice.

Botryites, or Botries, also denotes a sort of burnt cadmia, formed somewhat in the form of a bunch of grapes, adhering to the upper parts of furnaces, where that mineral is calcined. It differs from the placites, which is that gathered on the lower parts of the furnace; though Schroder gives a different definition, viz. into botrites, found in the middle of the furnace, placites in the upper, and otracies in the lowest part.

Botryoides, in Natural History, a species of Madrepores, having thick, fleshy, ould, clustered branches, with reticulate, craggy indentations. Habitat, unknown. Described in Solander and Ellis's Corallines.

Botrus, in Ancient Geography, a city of Phoenicia, near the coast and south of the river Eleutherus, mentioned by Polybius, Melas and Polybus. According to the latter (lib. v.) it was built by Ethbal, or Ethbalus, who reigned at Tyre in the time of Abib, about the year 923. B. C. Stephanus Byz. thinks that this was the city which is called by Josephus (xxii. 36) Tarus, and by the LXX Buxis, and enumerated among the 43 cities which were allotted to the Levites. This city, in Chalilien times, became an episcopal see, and its bishop, Porphyry, affiliated at the council of Chalcodon, held A. D. 449.

Bott, among Bone-lace Weavers, a kind of round cushion of light matter placed on the knee, wherewith they work or weave their lace with bobbins, &c.

Among the French the bilt, called ocellaire, is a little square wooden frame or deck, covered ordinarily with green stuff.

Bott, in Entomology. See Botts.

Bottstein, or Pottenstein, in Geography, a town of Germany, in the circle of Franconia, and bishopric of Bamberg; 22 miles E.S.E. of Bamberg.

Bottesdale. See Bottsdaie.

Bottetano, a town of Germany, in the county of Tyrol; 10 miles S. of Bruneck.

Bottia, or Bottia, in Ancient Geography, a country of Macedonia, in the neighbourhood of Thrace. Its limits are not ascertained by the ancient geographers, who mention it. Herodotus places it at the towns of Ichne and Phelm.

Bottle, a small vessel proper for holding liquors.

The word is formed from butellus, or butella, used in barbarous Latin writers, for a leffer vessel of wine; being a diminutive of buta, which denoted a butt or cask of that liquor. It is evidently derived from bute, bote, buta, batulea, butellaa, which occur in the middle ages.

We say a glafs bottle, a floe bottle, a leathern bottle, a wooden bottle, a bucking bottle.

Of glafs bottles, says Beckmann (Hist. of Inventions, vol. ii. p. 124.), no mention occurs before the 15th century; for the "Amphore vitree diligenter gypsta" of Petronius, (Sat. c. xxxiv. p. 86.) to the necks of which were affixed labels, expressing the name and age of the wine, appear to have been large jars, and to have formed part of the many uncommon articles by which the voluptry Timalchico wished to distinguish himself. It is, however, singular, that these convenient vefles were not thought of at an earlier period, especially as among the small funerals of the ancients, many are to be found, which, in shape, resemble our bottles.

Mr. Beckmann conceives, that he discovers the origin of our bottles in the figure of the Syracusian wine-flasks. Charpentier (Gloff. Nov. 1. p. 1722.) cites, from a writing of the 13th century, an expression which seems to allude to one of our glafs bottles; but this, attentively considered, refers merely to cups or drinking glasses. The name botellae, or botellae, occurs in the French language for the first time in the 15th century; but if it were more ancient, it would prove nothing, as it signified originally, and still signifies, vefles of clay or metal, and particularly of leathcr. Such vefles, filled with wine, which travellers were accustomed to fipend from their faddles, might be ftopped with a piece of wood, or clofed by means of wooden or metal tops ferewed on them; and fuch are still used for cuflon pitchers. We fhall here add, that ftoppers of cork muff have been introduced after the invention of glafs bottles. In 1553, they were little known; and their introduction into the fhips of the apothecaries in Germany took place about the end of the 17th century. Before that period, they ufed ftoppers of wax, which were more troublesome and more expensive.

The ancient Jewish bottles were cags made of goats' or other wild beafts' skins, with the hair on the inside, well fewed and pitched together: an aperture in one of the animal's paws ferving for the mouth of the vefl. Calmer.

Bottles of this kind are mentioned in scripture, and called οὐκόον; and they were ufed for carrying water through the deferts of Arabia and other countries, where springs and freams are fcarce. Such bottles, indeed, have been in common ufe both in ancient and modern times. They are mentioned by Homer, Od. v. 74, v. 246, and Od. v. 265. Salith speaks of them in Bell. Jug. 96, where he fays "Ex curris ures uti furent curabat," i.e. He provided bottles made of skins. That the ancient Romans were acquainted with goat-skin bottles is also evident from two lines of Virgil (Georg. ii. v. 58, 58.)

"Mollibus in pratis uncios faliere per ures.

From the circumfulions here alluded to we may infer, that these were leather bottles, which were oiled on the outside to make them more flippier, and more likely to ocafion the fall of thofe that hopped upon them. Horace (i. ii. Sat. i. v. 69, 69.) mentions greaty water, which was given to his gofts by Nauius, a man of a pariflonious difposition. Thus,

"Necque fruct simplex Nauius, unclam
Convivis præbebit aquam. Vitium hoc quoque magnum.

This "aqua uccia" has puzzled commentators; but it probably refers to an oillets, which the water contracted by being fetched in unclean leather bottles. Thofe, however, to which the fame appellation of bottles is applied in our translation of the Old Testament, are expresfed by different terms in the original; and they were made of various forms, and confided of different materials. Thus, in Gen. xxvi. 14. the "wottle," of water, given by Abraham to Hagar for herfelf and Ishmael, is in the original בזית, (bethzet,) which denotes an earthen pitcher; and it appears from Habbakuk (chap. ii. v. 15.), that they were ufed to drink out of thefe bethzets. Sir John Chardin, however, fuppofes that the bottle given to Hagar was a leathcr one. The "wottle" of wine, which Samuel's mother brought to Eli, (1 Sam. i. 24.) is called בזית, and was probably an earthen jar or jug; and the fame word is also ufed in Sam.
The term, translated "earthen bottle," in Jerem. xix. 14, is "bottle." A very different word is used in Judges xiv. 19, to signify the vessel out of which Josue gave milk to Sibera; it is called "Nadn, nade," which, having some reference to moist or oozing, was probably made of goat-skin, or the skin of some animal, and being constantly kept full of milk, was preferred in a plastic state. The same word is also used to denote the bottle in which Jeph sent wine by David to Saul, 1 Sam. xvi. 20. "Nadn" is also used to express the bottle into which the Pharaoh defines that his tears might be collected, Psa. xi. 8; and that to which he refers himself, Psa. cxviii. 83. He says "I am become like a bottle in the smoke," i.e., like a bottle kept in the tents of the Arabs, blackened with smoke. To the men of such a drinking vessel as a goat-skin bottle, as well as to the blackens contracted in the Arab tent, the Pharaoh probably refers; and it was a most natural image for him to use, driven from among the vessels of silver and gold in the palace of Saul, to live as the Arabs did, and consequently to be obliged frequently to drink out of a smoked leather bottle. The word used by Job (ch. xxvii. 19.) in the plural, is "Nadn, nade," and as "Nad, nade," in general, to feel or dwell, is it properly used to express a skin bottle, which would be made to swell by the liquor poured into it, and which would be more distended and enlarged, till they would at last burst, if they had no vent, by the fermentation of the liquor, as it advanced towards ripening. Hence we perceive the propriety of putting new wine into new bottles, &c., according to the appropriate allusion in the gospels (Matt. ix. 17, Mark, ii. 22, Luke, v. 37, 38), which being moist and strong, would refill the expansion, and preserve the wine to due maturity; whereas old bottles of this kind, being dry and more brittle, would be in danger of bursting, and were best adapted to receive old wine, the fermentation of which had ceased. These leather bottles are supported, by a faered historian, not only to be frequently rent, when grown old and much used, but also to be capable of being repaired (Josh. ix. 4.).

Modern travellers, as well as ancient authors, frequently take notice of these leather bottles. The Arabs, says Sir John Chardin, and all those who lead a wandering life, keep their water, milk, and other liquors, in these bottles, the manner of repairing which he also describes. They serve, according to this writer, to preserve their contents more fresh than in any other way. They are made, he says, of goat-skins: when the animal is killed, they cut off its feet and its head, and in this manner they draw it out of the skin without opening its belly. They afterwards few up the places where the legs were cut off, and the tail, and when it is filled, they tie it about the neck. These nations, and the country people of Persia, never go a journey without a small leather bottle of water hanging by their side like a flap. The great leather bottles are made of the skin of an ox, goat, and the small ones, that serve instead of a bottle of water on the road, are made of a kid's skin. In speaking of the Persians, the same traveller says, that they use leather bottles, and find them useful in keeping water fresh, especially if people, when they travel, take care to moisten them, wherever they find water. The evaporation thus furnished serves also to keep the water cool. He says, that the disagreeable taste of the leather is taken off, by causing it to rubake rofe-water, when it is new, and before it is applied to use. Formerly, it is said, the Persians perfumed their leather vessels with myrrh, or with incense. From him also we learn, that they put into these goat-skin and kid skin vessels every thing which they want to carry to a distance in the East, whether dry or liquid; they are thus preferred rather than if they were conveyed in boxes or pots; the ants and other insects are prevented from getting among them; and they are thus kept free from dust; and for these reasons butter, honey, cheese, and other such aliments, are included in vessels made of the skins of these animals. Accordingly, the things, particularly the balm and honey, which were somewhat liquid, that were carried to Joseph as a present, (see Gen. xlix. 11.) were probably included in little vessels made of kid-skins. Homer also refers to this mode of preserving various kinds of provision in leather vessels. Od. ii. 374.

The bottles made of skin resemble the "Girba," described by Mr. Bruce, in his Travels through Abyssinia, vol. iv. p. 334. "This," he says, "is an ox's skin squared, and the edges sewed together very artificially by a double seam, which does not let out water, much resembling that upon the bull English cricket balls. An opening is left in the top of the girba, in the same manner as the bunghole of a cask. Around this the skin is gathered to the size of a large handful, which, when the girba is full of water, is tied round with whip-cord. These girbas generally contain about 60 gallons, and two of them are the load of a camel. They are then all bismarked on the outside with gravel, as well to hinder the water from oozing through, as to prevent its being evaporated by the action of the sun upon the girba, which, in fact, happens to us twice, so as to put us in imminent danger of perishing with thirst,"

Glast bottles are better for cyder than those of stone. Glast bottles are cured by rolling sand or small shott in them; moly bottles, by boiling them.

Bottles are chiefly made of thick coarse glasses; though there are likewise bottles of boild leather made and sold by the cafe-makers.

Fine glasses bottles covered with straw or wicket, are called glaffes, or buttes.

The quality of the glases has been sometimes found to affect the liquor in the bottle. Mem. Acad. Scienc. 1704.

Bottle, is also a measure at Amsterdam, the same with the mingle.

Bottle, white. See Cucubalos Bheben.

Bottle-head, a species of whale.

Bottle-nose, in Natural History, a name given by the English to various animals; the cachalot is called the bottle-nose; so also any of the whale tribe distinguished by the gibbosity of their snout. In some parts of England the anus articulus of old writers is called the bottle-nose.

BOTTLING, or Bottling, the operation of putting up liquors in bottles corked, to keep, ripen, and improve.

The writers on good husbandry give divers rules concerning the bottling of beer, cyder, and the like. The virtues of Spa, Pyrmont, Scarborough, and other waters, depend on their being well bottled and corked, otherwise they lose both their taste and smell. To preserve them, it is necessary the bottles be filled up to the mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is also farther secured by a cement. Some improve their bottled beer, by putting crystalls of tartar and wine, or malt spirits; and others, by putting sugar boiled up with the essence of hone herbs and cloves, into each bottle.

Cyder requires special precautions in the bottling; being more apt to fly, and burst the bottle, than other liquors. The best way to secure them, is to have the liquor thoroughly fine before it be bottled. For want of this, some
leave the bottles open a while, or open them after two or three days bottling, to give them vent. If one bottle break, through fermentation, it is best to give them all vent and cork them up again. Mean cider is apter to break the bottles than rich. Some foaks the corks in sweetening water, to render them more pliant and serviceable. See Cyder.

Another particular to be observed is, to lay the bottles so as that the liquor may always keep the cork wet and swelled. Something also depends on the place where the bottles are set, which ought to be such as exposes them as little as possible to the alterations and impressions of the air: the ground is better for this purpose than a frame; sand better than the bare ground; and a running water, or a spring often changed, belt of all.

To hasten the ripening of bottled liquors, they are sometimes set in a warm place, or even exposed to the sun, when a few days will bring them to maturity.

BOTTOM, the lowest part of a thing as contradistin-
guided from the top.

Hydrostatical writers speak of the pressure of fluids, on the bottom of vessels; in which case, the law of gravitation is, that the altitude remaining the same, the pressure will be as the bottom. M. Leibnitz has affirmed, that a body, in falling through a fluid, does not press on the bottom, that is, does not increase the pressure on it; which is found to be false. Phil. Trans. No. 351, p. 370. A. D. S. an. 1692. p. 16.

When water boils, the bottom of the vessel is found considerably colder than it was some time before boiling; infor-
much that the hand may bear it in the former case, not in the latter. Hill. Ac. Sc. an. 1703. p. 29. See Boiling.

Bottom, in Navigation, denotes the ground or surface of the earth under the water.

They say, a rocky, sandy, gravelly, clayey bottom; a bottom with good hold, with a bad hold, &c.

The bottom of the sea, Ray observes, is level, i.e. the defcent from the shore to the deep is equal and uniform; but the bottoms of some seas are found higher than those of others. Count Marfigli has made divers inquiries into the structure of the bottom of the sea, and its beds of stones, silt, bitumen, &c. Ray, W. of Cret. part i. p. 84. See Sea.

Over the natural bottom of the sea is formed an acciden-
tal bottom, by the mixture of different matters, sand, shells, mud, &c. strongly compacted by the glutinous qua-
Hill. Acad. Sc. 1710.

Bottom of a Ship, that part of a ship below the water. This is also called the quick-work; and that above the water is called the dead-work. As the good or bad qualifications of a ship, with regard to sailing, steering, and staying well, veering, carrying full, flowing her cargo, carrying guns, &c. depends, in a great measure, upon the form of the bottom, every attention ought, therefore, to be paid to this particular point; and hence the method of contriving the bottom of a ship, so as to answer any intended purpose, is the nicest and most difficult part of ship-building; to this article the reader is referred.

That a ship may fail well, it is necessary to give her a long floor, with little rising both fore and aft, and the capacity of the fore-body equal, or nearly so, to that of the after-

body.

In order to make a ship steer well, the after-part of the bottom must not be full; the wing transom carried pretty high; the fashions-pieces well-formed, and not full below the load-water line; the midhip-frame carried well forward; to draw more water aft than at the stem; a considerable rake forward, but the stern-poll to be nearly perpendicular to the keel; and the upper works to be tight and as low as possible.

That a ship may carry a press of sail, the floor-timber must be flat and long; the lower futtock full; upper futtock nearly straight; the breads to be thrown out aloft, the main breadth carried high; the upper works light; and hence, the centre of gravity low.

To make a ship keep a good wind, and drive little to lee-
ward, requires a considerable length of keel, with respect to her breadth; a deep hold, and consequently a short floor-
timber, with a considerabile rising.

In order that a ship may carry her guns well above the water, she must have a long floor-timber, and not much rising; a full midship-frame; a low wing transom, and light upper works.

To obtain the preceding properties, very opposite rules must be followed; and hence it appears to be almost im-
possible to construct a ship so as to be possessed of them all. The body, however, must be so formed, that as many of these properties may be retained as possible; always observ-
ing to give the preference to those which are most required. If it is known what particular employment the ship is wanted for, those qualities then are to be principally adhered to, which are most essentially necessary for that employment.

Bottom, Copper, a practice now become pretty general in Britain, of covering the bottom with sheets of copper, which accelerates the falling of a ship, prevents the bottom from being worm-eaten, and keeps it long clean. It is, therefore, necessary, that ships, making long voyages, should be coppered.

Bottom, Double; a ship of this kind was constructed by Sir William Petty in the year 1663, which was found to fail considerably farther than any of the ships with which it had an opportunity of being tried. Her first voyage was from Dublin to Holyhead; and in her return, she turned into that narrow harbour against wind and tide, among rocks and ships, with such dexterity as many old seamen confessed they had never seen the like. This vessel, with seventy more, were lost in a dreadful tempest.

Bottom, Foul, that is, when the bottom of a ship is covered with shell-fish, weeds, &c. This greatly retards the rate of a ship, and prevents her from steering and working, and, besides, proves sometimes fatal. An instance of this happened to a large built ship from Africa, in this foul condi-
tion, that could not be steered into Liverpool, but was lost, entirely owing to her bottom not being scrubbed during the voyage. Every possible means ought, therefore, to be used to keep the ship's bottom clean. For this purpose a cask of scrubber has been found to answer with success when at an-
chor, and in calm weather on the open ocean. This scrubber is made of elm, about an inch thick, and a foot broad, the middle part of the frame just to fit a ten gallon cask, that was lathed to the bottoms at each end, and the long square spaces on each side of the cask were filled with birch-broom stuff, which projected about fix inches without the frame, and wedged flat towards the ends, with long wedges against boards that flide with small tenons at each end in a groove, to keep the birch flat and firm. Two of these were con-
ected together by iron-work, having a joint, that they may the more naturally ply to the curved or rounding parts of the ship's bottom. In using this scrubber, a block was fastened under the bowspit end, and another on the driver boom, rigged out right aft, a single block is reved in these blocks, and made fast to the slings, and just long enough...
to veer and haul the scrubber along the bottom fore and aft, close to the keel. Another rope is bent to the lower part of the scrubber, and hauled tight under the bottom, and made fast to the inside of the boat's main thwart, the upper part of the scrubber being even with the water's edge, at midships, on the other side. The people are then ordered to walk fore and aft with the rope to the scrubber, till it comes to the water's edge both ways, the boat moving the same way with the scrubber, the people in their helping, by pulling their hands against the ship's side, till the first depth is thought to be clean enough; then the people in the boat haul by their rope the scrubber a depth lower, by which, and the empty casks, it is confined and pressed to the bottom, at the different depths, till it is scrubbed down to the keel; and even the keel itself, by the rope going fore and aft under it.

**Bottom, Hagger.** A concave keel by which the sheer of the ship is apparently broken. Ships with long straight floors are most liable to this defect, either from accident, in taking the ground, improper lowage of the cargo, or otherwise. To prevent this, Mr. Hutchison advises to build ships with their floors and bottoms lengthways, to form an arch with the projecting part downwards, which will naturally not only contribute greatly to prevent their taking damage by their bottoms hogging and flaring upwards, either aground or afloat, but will, among other advantages, be a help to their falling, steering, steering, &c. This curved bottom is one of the principal properties of the life-boat.

**Bottom having several keels,** which, upon account of the very different form of the bottom from the common form, requires a particular description. This is a proposal of Thomas Gordon, esq. of Freemay, in his Principles of Naval Architecture," printed at Aberdeen in the year 1784, in order to unite the several properties of ships, which has hitherto been deemed impracticable; such as to make a ship fall well, keep little water, keep a good wind, &c. For this purpose the bottom, says Mr. Gordon, should be formed quite flat, and the sides made to ride perpendicular from it, without any curvature; which would not only render her more steady, as being more opposed to the water in rolling, but likewise more convenient for lowage, &c. and, while the simplicity of the form would contribute greatly to the calm and expedition with which she might be fabricated. Though diminishing the draught of water is, ceteris paribus, undoubtedly the most effectual method of augmenting the velocity with which vessels go before the wind, yet, as it proportionally diminishes their hold of the water, it renders them extremely liable to be driven to leeward, and altogether incapable of keeping a good wind. This defect may, however, be remedied, in a simple and effectual manner, by proportionally augmenting the depth of the keel, or, as large a keel would be inconvenient, on many accounts, proportionally increasing their number; as, in place of adding a keel eight feet deep to a vessel drawing fix feet water, to add to different parts of her flat bottom, which would be well adapted for receiving them, fix different keels of two feet deep each, at equal distances from each other, with proper intervals between, which would be found equally effectual for preventing these pernicious effects.

Thus then it appears, that a vessel drawing eight feet water only, keels and all, may be made to keep as good a wind, or be as little liable to be driven to leeward, as the sharpest built vessel of the same length drawing fourteen, nay twenty feet or upwards, if a few more keels are added, at the same time that the would be little more refilled in moving in the line of the keels, than a vessel drawing fix feet only. These keels, besides, would strengthen the vessel considerably, would render her more steady, and less liable to be overfed, and thereby enable her to carry more sail, &c. Vessels of this kind would likewise be well qualified for lying in docks and harbours when dry; and though the very quickest sailors of any, might be navigated in the shall-weat water; from which latter circumstance many important advantages would result, as running little danger from sand-banks, rocks, &c. being capable of riding in many bays, and entering many harbours, rivers, and creeks inaccessible to others, whether as an asylum, or for the purposes of trade or war; for bombarding, or making defences on an enemy's coast. By enlarging, perhaps doubling, the breadth of ships, and forming their bottoms flat, and well furnished with keels, they, in the first place, become much readier, so as to carry their guns well, roll little, if at all, and be enabled to carry greatly more sail, and that in a better direction; at the same time that they would be in no danger of being damaged or overfed, unless the masts were of a more extraordinary height indeed. Secondly, that they could carry more guns on their bow and stern, would have little or no occasion for ballast; and if any was used, would incur less danger upon its shifting. Thirdly, that there would be much more room upon deck, as well as accommodation below, the breadth being so much increased without any diminution of the height above the load water line, and without occasioning any necessary augmentation in the number of men for working the vessel, &c. These are the principal advantages of a ship of this construction; Mr. Gordon, however, proceeds to enumerate others.

**Bottom with sliding keels.** See Ship with sliding keels.

**Bottom, jogged,** the keel having a convex curvature. Long straight floored ships are most liable to be jogged, as well as hogged. This defect arises, in a great measure, from loading the ship with a weighty cargo, as lead, iron-ore, stones, &c. and flowing it in the main-body of the ship. This jogging of the bottom has, from experience, been found to inreduce the velocity; but, on the other hand, the ship is generally in a leaky condition. The principal method of remedying this defect, is to distribute the cargo more equably, so that the upward and downward pressufures may nearly counterbalance each other. This may be accomplished by means of a form-gage; for an account of which see that article.

**Bottom, to prevent from being worm-eaten.** One of the best remedies hitherto discovered for preventing worms from destroying the bottom of a ship, seems to be the coal-tar, invented by the earl of Dundonald, and manufactured at Cullors in Scotland. By many comparative trials, by sinking piles of wood for some considerable time in the water, some of which were payed with coal tar, and the others with common vegetable tar; it was found that, in those payed with coal-tar not the least appearance of the worm could be traced, the tar still remaining black and smooth upon the wood, which, on being cut, emitted a strong smell of the tar; whereas the other piles were observed to be full of worms. Some proofs of the efficacy of this tar will be inserted under the proper article.

A mixture of the oil of the cocoa-nut with lime has also been used to pay the bottoms of ships, in order to exclude worms.

**Bottom is also used to denote a whole ship, or rather vellal.**

In this sense we say, English bottoms, foreign bottoms. By the act of navigation, certain commodities imported in foreign bottoms, pay a duty called petty cullon; from which they are exempt, if imported in English bottoms.
Bottom is also used for what remains at the bottom of a vessel. In this sense, Paracelsus calls the sediment of urine, fundus urinae.

Bottom, or bottom, in the phyllo, a kind of iron slates, or ore, in the Staffordshire mines.

Bottom nails. See Nail.

Bottomry, in Navigation and Commerce, is a contract, in the nature of a mortgage of a ship, on which the owner borrows money, to enable him to fit out the ship, or to purchase a cargo for a voyage proposed; and pledges the keel or bottom of the ship (partem pro tolo), as a security for the re-payment. It is, moreover, stipulated, that if the ship be lost, in the course of the voyage, by any of the perils enumerated in the contract, the lender shall have his money; but if the ship should arrive in safety, then he shall receive back his principal, and also the interest agreed upon, generally called the "Marine Interest." However, this very may exceed the legal rate of interest. The pension of the borrower, as well as the ship and tackle, if they arrive safe, are answerable for the money lent, and the marine interest. But if the loan is not upon the ship, but upon the goods and merchandise, which must necessarily be sold or exchanged, in the course of the voyage, then the only borrower, personally, is bound to answer the contract; who is therefore, in this case, said to take up money at "Respondentia." Bottomry is a loan upon the ship, and respondetnia upon the goods. However, in the latter case, the personal responsibility of the borrower is not always the only security of the lender. If the money be lent for the outward and homeward voyage, the goods of the borrower on board, and the return for them, either in money, or in other goods, purchased with the proceeds of them, are liable to the lender. The money is to be repaid to the lender, with the marine interest, upon the safe arrival of the ship, in the one case, and of the goods, in the other. Such are the leading circumstances that discriminate these two contracts; in all other respects, they are nearly the same, and are governed by the same principles.

This kind of contract by bottomry, or rather respondetnia, was known to the Romans; they denominated it, "nauticum fenum," or "contractus trajecticis pecuniae," and it is treated of, both in the Digest, and the Code, "De nautico fenen." They called the sum lent, "pecunia trajectia," perhaps, because the borrower was accustomed to take the money on board with him in specie, in order to employ it in trade, in the course of the voyage, which money was to be repaid, after a fortunate voyage, with a stipulated interest, called "peculi premitium," or at a stipulated rate, called "peculi premia," or "nuphnum nautica," or "fura maritima," but it was lent on this condition, that if the ship should be lost, by the perils of the sea, in the course of the voyage, the lender should lose both principal and interest.

Bottomy essentially differs from a simple loan: because, in a loan, the money is at the risk of the borrower, and must be paid at all events; but in bottomy, it is at the risk of the lender during the voyage. Accordingly, upon a loan, the legal interest only can be reserved; whereas, upon bottomy, any interest may be legally reserved, which is agreed upon between the parties.

The contracts of bottomy and insurance resemble each other in several particulars: the lender and the insurer are alike liable to the perils of the sea; the former receives the marine interest, and the latter the premium, as the price of the risk, which of course varies, according to the length, and danger of the voyage. The perils to which both are exposed, commence and terminate together. The marine, and also the premium of insurance, are not due, if no risk be run, though this be prevented by the voluntary act of the borrower. These contracts, however, materially differ in a variety of respects. In bottomy, the lender furnishes the borrower with money, to purchase the goods that are risked; but an insurer furnishes no part of the property insured. The lender, in taking on himself the risk of the goods, does not contract any obligation to the borrower; a loss by the perils of the sea does not make him a debtor to the borrower, but only prevents the borrower from recovering his debt; whereas, in case of loss, the insurer becomes a debtor to the insured, to the amount of such loss, not exceeding the sum insured. In case of shipwreck, the lender, by the general law, has a lien on the effects saved, to the extent of the sum lent, and the marine interest, to the exclusion of the borrower; whereas, an insured person has an interest in the effects saved, in common with the insurer, so far as he was uninsured. The lender is not liable for particular average; but the insurer is liable for this, unless he be exempt by express stipulation. By the clause, "free of average," insurers may be exempted from general average; but in a case where the lender is liable by law, to general average, such a clause would be illegal and void. If the voyage be divisible into several distinct risks, the premium of insurance may be apportioned to each, and there may be a return for such as have not been begun; but in bottomy, if the risks be once commenced, and no loss happen, the marine interest must be paid entire.

This contract is eminently useful in a country, where persons in trade have not capital sufficient to carry on their foreign commerce; and by means of it, a kind of partnership is formed between the lender and the borrower, in which one supplies money, and the other skill, experience, and a spirit of adventure; in which one risks the perils of the sea, and the other compensates him by a share of the profits of the adventure. But in other respects this contract bears no resemblance to a partnership, as it has no community of capital nor any community of loss.

Former contracts of this kind were more common in this country than they are now; because the immense capitals engaged in every branch of commerce, superceded the necessity of such loans. On this account money is now seldom borrowed in this manner, unless it be by the makers of foreign ships, who, being in our ports, need pecunia affiniae to aid, to pay their men, to purchase provisions, &c., or by officers and others belonging to ships engaged in long voyages, who are allowed to trade to a certain extent with the prospect of great profit, but without capitals of their own; in this case, though it now seldom occurs in this country, they take up money on respondetnia to make their investments.

This contract, required to be always in writing, is sometimes made in the form of a deed poll, called a "bill of bottomy," executed by the borrower; sometimes in the form of a bond or obligation, with a penalty. But whatever may be its form, it must contain the names of the lender and the borrower, those of the ship and master; the sum lent, with the stipulated marine interest; the voyage proposed, with the duration of the risk; and it must also specify, whether the money be lent on the ship, or on the goods on board, or on both; together with any other stipulation agreed by the parties to be introduced into the contract. It is also essential to this contract, that the marine interest be expressly reserved in it.

Concerning the parties in this contract we observe, that any person, who is capable of contract, may lend money on bottomy. Any person, who has a vested assignable property
property in a ship or cargo, may borrow money on bottomry or
responsibility, to the extent of his interest. The contract
still remains to have originated from the practice of permitting
the master of a ship, in a foreign country, to hypothecate the
ship, in cases of necessity, for the purpose of raising money
to reit; and indeed, it is necessary for the safety of the
ship, and in order to ensure the success of the voyage, that
the master, in the absence of the owners, should have this
power, implied by the marine law in his appointment.
However, with respect to the purposes of this contract, he
possesses no such power, till he becomes actually master, or as
far as this branch is concerned, till after he sets sail. Hence,
if he borrows money on bottomry in the place where the
owners reside, without their express authority, the act can
only concern himself, and affect his own interest on board.
In a foreign country, and in the absence of the owners, the
master cannot raise any money on bottomry for any debt of
his own, but merely for the use of the ship, in cases of
necessity; and this necessity must appear in the written contract,
or else the lender will have neither a lien on the ship, nor an
action against the owners; the master alone being liable.
Nevertheless the lender is not bound to look to the application
of the money, but may have his action against the owners
and his lien on the ship, without being obliged to prove that
the money was properly applied, unless he be an accomplice
in any fraudulent misapplication of it; in which case the owners
may impeach the contract upon that ground.
As an insurance upon any trade with the enemies of the
state in time of war is void, the lending of money upon
bottomry is illegal.

As to the articles hypothecated, they may be the body,
tackle, furniture, and provisions of the ship, the whole or
any part of the cargo, or both ship and cargo. On respons-
dentia, indeed, money may be borrowed without hypothe-
cating any thing; and the borrower may take money on
board with him in specie, for the purpose of employing it
in trade, during the course of the voyage. But it is essen-
tial to the nature of the contract, that the money lent, or
some equivalent to it, be exposed to the perils of the sea, at
the risk of the lender. The same reasons of policy which
forbid gaming insurances, equally apply to wagers in the
form of bottomry loans. The mischief likely to result from
this practice have been restrained by our legislature.
Accordingly the statute 16 Geo. II. c. 8. recited and made
perpetual by 22 C. II. c. 11. § 2, after reciting "that
masters and owners of ships, having inferred, or taken upon
bottomry, greater sums of money than the value of their
adventure, do willfully call away, burn, or otherwise destroy
the ship under their charge, to the great loss of the mer-
chants and owners," enacted, for future prevention of the
same, "that if any captain, master, mariner, or other
officer belonging to any ship, shall willfully call away, burn,
or otherwise destroy the ship to which he belongs, or
procur enclose to be done, he shall suffer death as a felon."
When this species of gaming came into use in England, and
performs borrowed money "on the voyage," as it was called,
without any interest in the ship or cargo, which they could
hypothecate, the statute 16 Geo. II. c. 37. § 5, directed,
that upon East India voyages the money should only be lent
on the ship or goods on board, with benefit of salvage to
the lender. As many British subjects, in the reign of
George I. fitted out ships, and clandestinely traded to the
East Indies under colour of foreign commissions, the statute
7 Geo. I. c. 21. § 2, made to restrain such practices, and
to protect the monopoly of the East India company, de-
clares, "that all contracts and agreements, made or entered
into by any of his majesty's subjects, or any person or per-
sons in trust for them, for the loan of any money, by way of
bottomry, on any ship or ships in the service of foreigners,
and bound to, or designed to trade in, the East Indies, shall
be void." This statute expressly, and in the most unquali-
tied terms, restrains the lending of money on bottomry, on
any ship or ships in the service of foreigners. But whether
a ship, the property of British subjects, fitted out by them,
and laden with their merchandise, can be said to be in the
service of foreigners, merely because he is furnished with a
commission from a foreign state, is a question upon which
there has not yet been any judicial decision. Freight may
be both incurred and hypothecated upon a bottomry con-
tract. Seamen may borrow money on any goods which they
have on board; but with respect to their wages, they can
never injure them nor borrow money upon them.

As to the rate of marine interest, Julihamian, who, in ordi-
inary cafes prohibited the cestextum, or one per cent. per
month, or 12 per cent. per annum, allowed it in this contract,
and forbade any higher interest. But in modern times,
when commerce is carried on between countries remote from
one another, it is impossible to fix any precise standard by
which this may be regulated. The legality of marine inter-
est, however exorbitant it may be, is allowed by course both
of law and equity; nor can it be deemed usury, provided the
money lent be "bona fide put in" risk. This interest com-
ences with the risk, and also terminates with it. But if
the time of the contract be a fixed period at a stipulated rate,
and the voyage be performed within that period, the marine
interest for the whole period will be due; but if the voyage
exceed that period, the risk of the lender will cease, and
the debt becomes obloque, though the voyage should not be
ended. The risk also will cease, if the ship has been pre-
vented by unavoidable accident from performing her voyage
within the time limited. Upon the cessation of the sea-risk,
if the borrower delays the payment, common interest begins
to run on the principal, exclusive of the marine interest,
"ad plus juris," without any demand.

The perils of the sea, which constitute the risk of the
lender, comprehend all those accidents and misfortunes to
which ships at sea are liable, and which no human foresight
or precaution can prevent. Accordingly contracts on bot-
tomy and responsion express expressly provide, that "if, in
the course of the voyage, and within the time prescribed,
by such loss of the ship by fire, enemies, men of war, or
any other casualties, shall unavoidably happen," the bond
shall be void, and the borrower discharged; so that the perils
are nearly the same with those to which the underwriters
upon a policy of insurance are liable. A loss by pirates, though
not usually expressed in securities of this kind, is included
in the risk. Nothing, however, but a total loss, in a case of insurance, can
discharge the borrower; and the obligation remains, notwithstanding
any damage which the goods may suffer by the perils of the
sea; nor is there any deduction on account of such
damage. In this respect the lender on bottomry is in a better
situation than an insuror, who is obliged to indemnify the
injured, to the extent of the sums, inured, from all damage
arising from any of the perils against which the in-
insurance is made. No capture or detention, that does not
amount to a total loss, in a case of insurance, can
discharge the borrower. Lord Mansfield, in delivering the opinion
of the court, in a case of this kind, said, "It is clear, that,
by the law of England, upon a bottomry contract, there is
neither average nor salvage." But the lender is not liable
for losses proceeding from the internal defect of the thing
that is hypothecated, unless by express stipulation, such as the
ship's not being sea-worthy, and perishing by age, rotten-
nets, or any such cause, or the goods perishing of themselves,
liquors
liquors running out through the defect of the casks, dry goods heating and fermenting by length of time, &c.; nor is the lender liable for the act of the owners or master of a ship, as if the voyage be changed by order of the owners, or if a loss happen by the barrauy of the master, or by the misconduct of the merchant. In these cases the borrower is not discharged, except by express stipulation, which shall render the lender liable for every loss not occasioned by the act of the borrower. Nor is the lender liable for any loss by smuggling, which occasions a forfeiture of the ship, and a confiscation of the goods, unless he was privy to it. In England, if the money were lent to be employed in a trade prohibited by law, the contract would be void; and the sum lent could never be recovered from the borrower, even though no loss had happened. The lender, like an insurer, is only answerable for losses that happen within the time and place of the risk, specified in the contract; and, therefore, if the ship deviate from the voyage, without necessity, neither the lender nor the insurer will be liable to any loss that may afterwards happen. (See Insurance.) If the ship be pledged into the King's service, this will excuse a deviation; but if the borrower allege a deviation, this must be explicitly denied. A change of the ship, without necessity, discharges the lender. Money is generally lent for the whole voyage, outward and homeward; or for either separately; or for a limited time. The contract usually specifies the commencement and end of the risk; and in any misfortune, happening before or after, is at the risk of the borrower. If the voyage be described in the bond, but the time of the commencement and end of the risk be not specified, the risk, as to the ship, shall commence from the time of her setting sail, and continue till the anchors in safety at her port of destination; and as to goods, from the time of their being shipped till they are safely landed. When the loan upon goods is both for the outward and homeward voyages, the lender continues liable to the risk, during the homeward voyage, on the goods by which those have been replaced on which the money was lent.

Between insurance and bottomry there is this difference; that an insurer, independently of previous stipulation to the contrary, is liable to the charge of particular average, whereas, a lender without express stipulation is exempt from it: but, by the general law of merchants, in case of gross or general average, the lender shall contribute to discharge the borrower; and it is maintained by some writers, that the nature and object of the bottomry contracts seem to require, that the lender should be liable for general average. Lord Mansfield, however, as we have already observed, is of opinion, that, by the law of England, there is neither average nor salvage upon such contracts; and in this opinion Lord Kenyon concurs. But Sir John Marshall observes, that he has not been able to discover any decided case, or authority in the law, to warrant this doctrine. He also differs from another learned writer, (Parker,) who thinks, that the statute 19 Geo. II. c. 37, § 5, provides, that the benefit of salvage shall be allowed to the lender on East India voyages, conclusively proves, that there was neither average nor salvage upon bottomry contracts at common law. Mr. Marshall is of opinion, that this statute has not introduced any new principle into the law, either of insurance or bottomry contracts; but merely reformed them to their original and proper use, from which a spirit of gaming had perverted them. Nor can he admit, that, because the statute gives the benefit of salvage to the lender upon East India voyages, he was not therefore entitled to this at common law. But admitting this to be the case, does it hence follow, that he was not liable to general average at common law? The statute makes no mention of general average. It has been determined, however, that if an insurance be made in England, upon a bottomry interest, upon a foreign ship, and it appears that the lender is liable, by the law of the country to which the ship belongs, to contribute to a general average, the under-writers upon the policy will be liable for such contribution.

As the statute 19 Geo. II. c. 178 gives the benefit of salvage to lenders on bottomry, and bottomteria securities, restricted to East India voyages, it has been a subject of inquiry, whether, before that act, the lender upon any voyage was entitled to the benefit of salvage. By the general law of merchants, the event upon which the borrower is discharged, is the total loss of the ship or goods, upon which the money is lent, in consequence of the perils mentioned in the contract. The borrower is bound to pay principal and marine interest, provided the ship or goods, on which the money is lent, arrive at its defined port, however damaged or depreciated by the perils of the sea; nevertheless, if part should be captured or lost, the borrower is only bound to pay in proportion to what remains. If the ship be lost, and the goods saved, the contract remains in force, and the borrower becomes liable, provided another ship can be procured to convey the goods to the place of their destination. But for the expense of this other vessel, the lender is accountable; and if no other can be procured, the borrower will be discharged, on accounting to the lender for the proceeds of the goods saved. Blackett. Comm. vol. ii. p. 457. Marshall on the law of Insurance, vol. ii. b. ii. p. 632.

**Bottomry, bill of,** is a contract between two persons, the one borrowing, and the other lending a sum of money, by which the borrower, setting forth his intention to make a voyage in a certain ship therein named, acknowledges the receipt of a certain sum of money from the lender; on this condition, that if the ship does happen to perform her voyage, without any disaster by enemies or otherwise, then he is to restore that sum to the lender, with an additional sum, therein expressed, for the interest, within a certain time after his return; but that if the ship be lost, or taken by enemies or pirates, then the peron of the borrower to be for ever discharged, and the lender to bear the loss. For the form of such a bill by deed, and when the ship is to go to several ports, see Marshall's Treatise on the Law of Insurance, vol. ii. Appendix, p. 718. See Bottomry.

**Bottomi, ALBERTUS, in Biography, of an illustrious family, originally from Parma, was born at Padua, in the early part of the 16th century. After passing through the usual school education, in which he distinguished himself, he applied to the study of medicine, took the degree of Doctor, and was soon after advanced to the chair of professor in that faculty, which he filled many years, with singular credit. He died at a very advanced age, in 1556, leaving behind him, Haller says, an immense property. He published, "De vita conferenda," Patav. 1583. 4to. "De morbis malaebribus," 1585, reprinted in the collections of Bohnen and of Spachius. "Methodi medicinales duae, in quibus legitima medendi ratio traditur." Francof. 1595. 8vo. For the titles of other publications by this author, see Haller Bib. Med. Eloy. Diet. Hist.**
BOTTONI, Dominique, the son of Nicholas Bottoni, a celebrated philosopher and physician of Lentini, in Sicily, born the 6th of October 1641, received his education under Peter Castello. In 1674, he was admitted to the degree of doctor in medicine, and was soon after made physician to the marquis De Villa Franca, viceroy of Sicily, physician to the royal hospital of Messina, and superintendent of the physicians there, with a pension of 50 crowns per month. He afterwards enjoyed a similar situation under the viceroy of Naples. In 1677, he was made corresponding or honorary member of the Royal Society of London, to which he had previously sent his "Ideahistorico-phylicae de magno truncatione terretur morte," which is published in their transactions. We have also by this writer "Pyrologia topographica, id est, de igne dissertatio, juxta loca, cum figuris descriptione," Neapol., 1692, 4to. "Febris rheumaticae malignae, historia medica," Messina, 1712, 8vo. "Prefere fulcurti contro il contagio malare," Messina, 1724, 4to. He died about the year 1731. Eloy. Dict. Hist.

BOTTINO, in Geography, a town of Italy, in the duchy of Parma; 9 miles S. E. of Parma.

BOTTYS, in Botany. See CHENOPODIUM.

BOTTYSIS. See BYSSUS.

BOTTIS, in Zoology, bats and horsecorns. See OESTRUS genus, and species EQVI, BOTIS, HEMORRHODALIS, VETERINUS, OVIS. There are a peculiar kind of grub, found not unfrequently in the stomach of the horse, of a cylindrical figure, pointed at one extremity, and obtuse at the other, and bent every where with numerous rigid spines. There are at least two different kinds inhabiting the stomach of the horse, which at length produce, on their arriving at maturity, a two-winged insect of the fly kind.

Besides those of the horse, there are others of a distinct kind, but belonging to the same family, which live in their grub state under the skin of the backs of oxen, the deer, and the rein-deer; and others, again, occupy for a dwelling the frontal cavities of the head of the sheep, and cells at the base of the horns; and others inhabit also the same situations in the deer. They exit on the pus and lymph they create on these membranes by their irritation; and when full fed, they fall to the earth, and undergo the usual transformations of other insects.

The inaccessible situations of these animals in their larva state, and the impossibility of raising them out of these situations, has been the cause, probably, of their history having so long remained in the greatest obscurity.

They have been generally considered by the vulgar as true worms of the intestines, and similar in their origin to other worms of the intestinal canal, than which nothing can be more untrue.

The following is a concise detail of what is at present known respecting them; the account purporting nearly the order in which the discoveries have been made. The first who laboured to unveil the hidden and extraordinary economy of these animals was Vallisneri, an Italian of Padua, and the pupil of Malpighi. Before his time, the most absurd notions prevailed respecting them. The Romans, who had seen them hanging to the extremity of the reftum of the horse, believed them to be pieces of the intestine itself torn away by the worms and animals existing within them; and Vegetius has thus described them: "Hujusmodi passiones figuram fill (morbus coringinum, cum inventur humor in ano fabulous simili: eit namque funis ex illis vulneribus quae defilios intrificus fecerunt." Vallisneri, in his first essay, decribed the changes of the ossus buvis; giving indifferent figures of them, and tracing them from the back of the ox to the perfect state of a fly. This essay was published soon after the year 1700. Indeed, all that is known respecting them was discovered within the limits of the last century.

The next essay develops the history of the ossus buvis, or of that insect which is found infesting the nostrils and cavities of the face of the sheep; and in a subsequent volume (ed. Venezia, vol. ii. p. 163.), he published his observations on the botis of the horse. He was embarrassed by the great difference he found in the appearance of the botis of the horse; and hardly knew whether to attribute it to a difference of sex, or feeding, or of their being two different kinds, which subsequent discoveries have fully confirmed to be the case. His figures of them are very obscure, and ill expressed, so much so that it requires an eye acquainted with the appearance of these insects, at all to identify them. They are, however, without doubt, designed to represent the oss. buvis and ae. hemorroidalis.

The next labourer in this obscure path of natural history, was the celebrated Renemur, vol. iv. p. 508. of the "Memoires pour l'Histoire des Insectes." He repeated all the experiments of Vallisneri respecting the above three species, and fully confirmed all he had said respecting them; accompanying his account with ample details of their appearance and habits, and their descriptions with much better representations of them than his predecessor. Madame de Breauté, an abbess, in whose pages he sufficiently enlarges, at length furnished him with an opportunity of getting the larvae of the ae. buvis from some of the cows belonging to her convent; and on them he made his observations. Among other remarks, in this interesting memoir, he mentions, that by a singular chance he observed a line of small air-bubbles arranged along the side of the insect, and placed opposite to the spiracles, being entangled in the pus, which every where covered its surface, and corresponding in number and position to these openings; which would seem to prove that these spiracles are designed, not for the admission of air, as is generally conceived, but in reality for its exit; the air being received by a cartilaginous tube opening at one end of the insect, viz. that extremity which is placed next the external opening of the skin, and which becomes the tail part of the future insect, the larva being, in reality, inverted in the abcefs. He very candidly observes, however, that he could not force any air through these apertures, by holding the larva under water, and compressing it with the fingers.

He also noticed, that the opening in the skin, through which the larva breathes and evacuates, is considerably enlarged about the period of its exit, by the animal raising itself in the abcefs, and presssing against it; and after some days of this discipline, the aperture being enlarged, he works himself through by successive efforts, and falls to the ground. This excellent observer particularly mentions also their launching themselves from the back of the animal at an early hour of the morning in preference to any other part of the day.

The perfect insect, he observes, could not be induced to take any kind of food or nourishment, though he presented it with a great variety; a circumstance, indeed, that is not so much to be wondered at, since a large share of the insect world appears to pass the last stage of their lives, not only without food, but without organs for receiving it. Generation would appear to be the leading purpose of this stage of their existence.

It is particularly worthy of remark, as it may be the means of exciting those who may be possessed of the opportunity to further research, to make mention of the recitals given by this celebrated observer in another memoir (vol. v. p. 66.).
p. 66.), where he describes the larvae found in the cavities of the face of the flag; and it is evident that they are widely different from those inhabiting the same place in the sheep, or indeed from any other species at present known. He did not succeed in his attempts to breed the fly from these larvae; and we are therefore in the dark respecting this insect: and, unless it be the *osiris nagla* of Limnaeus, which, on several accounts, it does not appear probable that it is, it must be a new species.

Reaumur seems fully to have believed the absurd doctrine of Vallisneri, that the parent fly entered actually into the nostrils and faces to deposit its eggs, of which we shall have occasion to speak hereafter more particularly.

Next to the works of Reaumur, in this line of research, follow the writings of baron De Geer, who has followed and confirmed the discoveries of Vallisneri and Reaumur, without adding any thing of importance to their observations. He seems also to entertain, without hesitation, the opinion of Vallisneri, that the *osiris eqvi* enters the rectum to deposit its eggs. We find, however, that he was aware that Limnaeus, under the title *os. bovis*, had confounded two distinct species.

He also erroneously appears to have considered the *os. bovis* and *hemorrhoidalis* as one species, being deceived by the circumstance of their description, which, as to colours, is very similar.

Limnaeus next, by the extraordinary conciseness of his writings, seemed to flatten the enormous details in the natural historians of the preceding age, whose works were rapidly becoming too voluminous even for perusal. On most occasions he brought what was important to be known within the narrow limits of a few Latin phrases well expressed. He marshalled, for the first time, the scattered members of this extraordinary race under the common family title of *osiris*. He, however, was only acquainted with five species, all European; *bovis, tauri, hemorrhoidalis, nagla*, and *equis*. His specific characters are very appropriate; and we shall have occasion, in enumerating the species at present known, at the conclusion of this general account, to give them nearly as he had done.

Fabricius next added to this family three more species; the *os. bucatus, os. pecuvi, os. trunpa*. Describing from cabinets, without entering into their history, has been the source of the greatest confusion. His *os. vituli* is a mere variety of the *eqvi*; and the Limnaeus *bovis*, which is the commonest species, seems to be altogether omitted in his enumeration.

Gmelin next occurs; and, collating from all quarters, without any acquaintance with the animals themselves, has added three more species, which he believes to be new, from the works of professor Pallas. These are indicated by the names of *antiopha,* *fissiculata,* and *beninisi.*

The European species, especially those that infest our cattle, horses, and sheep, in Great Britain, being the most interesting, we shall proceed to illustrate the most curious circumstances of their history, and barely mention the names of the rest, and the animals and country they inhabit.

Limnaeus, through the whole course of his life, had never met with the true fly produced by the ox-bot, but had constantly taken a very dilimiliar one which infests the horse for it. Indeed, this insect is truly rare. Vallisneri had never seen but one, and that was mutilated. Reaumur, with uncommon pains, had raised two or three to the perfect state of a fly, and informs us, that to effect his purpose more completely, he employed a cow-herd to collect him, promising him the price of half a day's labour for each he should bring; but out of thirty procured by this means not one lived. The cow-keeper, no doubt, too eager for his reward, had pressed them with his fingers from their situations under the skin, before they were perfectly ripe and full fed; in which case they would certainly all perish, even though within a day of this period.

There is only one good specimen of this insect that we know of in England, even at this time, which is in the collection of Mr. Thomas Allen, and was taken from the back of a cow near Hampton court. By rare chance we took another of these in the Alps, between Salanche and Domeville, after observing it to settle on some dung that lay in the road where some cattle had recently pasted, and which, on our return through Germany, we presented to the venerable and very respectable professor D. Schreber of Erlang, the intimate friend and pupil of Limnaeus, who, we were privileged to find, till that time had not seen it.

Nothing is, however, more easy than to procure these insects by the simple means we formerly tided, and the details of which may not be unacceptable to the public, especially to those who wish to see them with curiosity, or from a desire to procure them for their cabinets. During the latter months of the summer, at a time when the animals are most frequently found of a mature age, and ready to quit their habitations, which is discoverable by the superior size of the tumor, and by the increased diameter of the external opening in the skin; selecting such as these, the hairs are to be removed with a pair of scissors to some little distance from the tumor, and a piece of leather thickly spread with pitch, through the centre of which a hole is cut, and into this is inserted a small gauze poultice or bag; the pitched leather is now placed on the skin, to which it readily adheres, and the insect, when it falls from the abscess, is caught by the bag, where, as it cannot escape, it remains till removed by the person who looks after them. Three larvae procured in this way, produced two flies in very good condition; one fled away during some experiments that we were making with it; the other was given to Mr. Allen, as above stated, after drawings had been made of it for the use of the Linnaean society.

We are now under the necessity of advertsing to a small communication sent to the Linnaean society by the writer of this article, in the year 1756, and published in the third volume of their Transactions, p. 289, as this memoir contains some farther observations and discoveries than the which had fallen within the notice of Vallisneri and Reaumur, we shall briefly extract from them what is new or useful.

Page 291. "The larva of the *osiris bovis* is very unlike the other larvae of this genus, so much so that I did not imagine, till I had procured the fly from it, that it was the larva of an *osiris*. It neither possesses the aculeus, the lips, or the marginal fæces, which are the prominent characters of the larva of the *os. eqvi* and *hemorrhoidalis*. When young, the larva is smooth, white, and transparent; as it enlarges, it becomes brown; and about the time it is fully grown, it is totally of a deep brown colour, having numerous dots on its surface, disposed in transverse interrupted lines paling round the segments. Two distinct and different kinds of lines are seen on each segment; the uppermost of these is narrower, and consists of larger dots. Underneath these there is a broader line, and the dots smaller. The first are easily seen, by using the lens, to be real hooks bent upwards, or towards the tail of the insect; and on examining the broader line of small dots, with a tolerably powerful magnifier, they were found also to be real hooks turned in an opposite direction to the former, that is, downwards in the abscess, and towards the head of the insect. This singular arrangement of hooks round the body of the larva, in this instance, serve the purpose of legs in other larvae, enabling it to move about;
in the abcess at pleasure, and to crawl out of it when ripe, and renders the use of the tentacles, observable at the small end in the other species, not necessary in this.

"These hooks, being erected by the muscles of the skin, according to the series of them used by the larva, it appears to be raised or depressed in the abcesses; and by this motion, and the consequent irritation, a more or less copious secretion of pus is produced for the suffusion of the larva. The chrysalis continues in that state from about the latter end of June till about the middle of August, when the fly, forcing open a very singular margined triangular lid, or operculum, at the small end, made its appearance.

"Although its effects on the cattle are so often remarked, yet the fly itself is rarely seen or taken, as the attempt would be attended with considerable danger, if in pursuit of the oxen. The pain it inflicts in depositing its eggs, appears to be very severe. When one of the cattle is attacked by this fly, it is easily known by the extreme terror and agitation of the whole herd. The unfortunate object of the attack runs below from among them to some dilated part of the heath, or the nearest water. The tail, from the severity of the pain, is held with a tremulous motion swinging from the body; and the head and neck stretched out to the utmost. The rhythmic, from fear, generally follow to the water, or dipper to different parts of the field.

"When the oxen are yoked to the plough, the attack of this fly is attended with real danger to the drivers; since they become perfectly uncontrollable, and will often run with the plough directly forwards through the hedges, or whatever obstructs their way.

"There is provided, on this account, to many ploughs a contrivance immediately to let them at liberty. The singular feat attending the attack of this fly on the herd, has often been the subject of poetical description; no one has, however, more naturally or elegantly delineated it than the bard of Mantua:

—Eli lucos silari circa iliecibuseque virentem
Plurimus alburnum volitant cui nomen abilo
Romanum ed, oeffron Graii vertere vocantes:
Asper, acerba, fonans: quo tota exterrita sylvis
Diffigiunt armenta: furit mugitibus atber
Concussus, sylvaeque, et sicci ripa Tanagri.

Georg. lib. iii. ver. 146—151.

"The strongest and healthiest beasts seem constantly to be preferred by this fly; and theirpossessing them in their backs is considered as a criterion of goodliness with the dealers in cattle; and the tanners observe, that their beast and strongest hides have the greatest number of bot-holes in them.

"The whole of this family of insects appear to have a strong dislike to moisture; since the animals find a secure refuge, when they get into a pond or brook, where the other flies which annoy them follow without hesitation, but the oeffri rarely or never; and during very cold, rainy, or windy weather, they are not to be seen.

"Among the country-people, the larvae of this insect are commonly known by the name of warbles, wormuls, or wormuls, or more properly bots."

We now transcribe from the above memoir which is most worthy of notice respecting the oeffrus equi, or large horse-bot.

"These larvae attach themselves to every part of the fo- mach, but are in general most numerous about the pylorus, and are sometimes, though much less frequently, found in the intestines. They hang most commonly in clusters; being fixed by the small end to the inner membrane of the food, where they adhere by means of two small hooks or tentacula. When removed from the stomach, they will attach them-

elves to any loose membrane, and even to the skin of the hand; for this purpose, they draw back their hooks almost entirely within the skin, till the two points of these hooks come close to each other; they then prefert them to the membrane, and keeping them parallel till it is pierced through, they expand them in a lateral direction; and afterwards, by bringing the points downwards, or towards themselves, they include a sufficient piece of the membrane with each hook, and thus remain firmly fixed, for any length of time, without any further exertion from the animal.

"All those bots which feed on the mucous membranes lining the canals of the body, are provided with these tentacula; whilst those which inhabit the skin, will be found universally without them. The oeffri of the sheep has them also, but uses them only in passing over the membranes on which it lives, making them a fixed point to which it draws up its body, and thus secures its passage along those smooth and lubricated surfaces of the nostrils.

"The larva of this bot, when very young, is of a cylindrical figure, of a pellicul rubra, and appears without spines to the segments. As it acquires an increase of size, it affumes a more flattened appearance, becomes whiter; and the spines, which are tiny with black, become very visible, being placed in double lines, and directed towards the tail, or truncated end of the larva.

"Their food is probably the chyle, which, being nearly pure aliment, may go almost wholly to the composition of their bodies without any excrements besides; though, on digestion, the intestines is found to contain a yellow or greenish matter, which is derived from the colour of the food, and shews that the chyle, as they receive it, is not perfectly pure.

"The swarms of their growth, and the purity of their food, must occasion what they receive in a given time to be proportionally small; for whereas probably arises the extreme difficulty there is found in destroying them by any medicine or poison thrown into the stomach. Opium, tobacco, or the drastic purgatives, which often bring away in abundance, the common worms of the intestines, produce little or no effect on these.

"On opening the body of the bot, and removing the gelatinous matter, the air tubes are seen, and seem of a splendid silvery colour, glittering very beautifully, as though they were injected with the purest mercury; they remain distended by their own inherent elasticity, and are filled with air to their minutest ramifications.

"Respiration appears to be the office of these air-canals, which are the lungs of the larva; and, confirmed in this point of view, they are much larger than the respiratory organs of any other animal, which is the more extraordinary, if the respiration of animals be for the production of animal heat; this being unnecessary to larvae, that are supplied so abundantly with it from the high temperature of their residence in the living stomach. Nor can these organs be formed for the purposes of the future insect, since they cannot be detected in either the chrysalis or fly. One should almost, from this circumstance, be led to suspect that the respiration of animals was more intimately connected with the reception of food, and the converting it into living matter than any other desig. Though it would also appear, that the impurity of the air in the stomach, and its casual supply might render these larger reservoirs necessary.

"The larvae of the large horse-bot attain their full growth about the latter end of May, and are coming from the horse from this time to the latter end of June, or sometimes later. On dropping to the ground, they find out some
some convenient retreat, and change to the chrysalis; and in about six or seven weeks, the fly appears; for the description of which, see the conclusion.

The mode pursued by the parent fly, in order to obtain for its young a situation in the thorax of the horfe, is truly singular, and is effected in the following manner. When the female has been impregnated, and the eggs are sufficiently matured, the seeds among the horfes a subje& for her purpose; and advancing on the wing, the holds her body nearly upright in the air, and her tail, which is lengthened for the purpose, curved inwards and upwards. In this way, the approaches the part where the design to deposit the egg; and suspending herself for a few seconds before it, suddenly darts upon it, and leaves the egg adhering to the hair; the hardly appears to settle, but merely touches the hair with the egg held out on the projected point of the abdomen. The egg is made to adhere by means of a glutinous liquor secreted with it. She then leaves the horfe at a small distance, and prepares a second egg; and poizing herself before the part, deposits it in the fame way. The liquor dries; the egg becomes firmly glued to the hair; and this process is repeated by various flies, till four or five hundred eggs are sometimes placed on one horfe.

The horfes, when they become affected by this fly, and find it does them no injury, as the tabanids and conopids, by sucking their blood, hardly regard it, and do not appear at all aware of its infective object.

The inside of the knee is the part on which these flies are most fond of depositing their eggs, and, next to this, on the side and back part of the shoulder, and lastly on the extreme ends of the hairs of the mane. But it is a fact worthy of attention, that the fly does not place them promiscuously about the body, but constantly on those parts which are most liable to be licked with the tongue; and the ova, therefore, are sporadically placed within its reach. Whether this be an act of reason or instinct, it is certainly a very remarkable one; and one should suspect, if it was the latter, it ought to direct the performance of the act in one way only.

Whichever of these it may be, it is, without doubt, one of the strongest examples of pure instinct, or of the most circuitous reasoning, any insect is capable of. The eggs thus deposited, I at first supposed were loosed from the hairs by the moisture of the tongue, aided by its roughness, and were conveyed in this way to the thorax, where they were hatched: but on more minute search, I do not find this to be the case, or at least only by accident; for when they have remained on the hairs four or five days, they become ripe, after which time the slightest application of warmth and moisture is sufficient to bring forth in an instant the latent larva. At this time, if the tongue of the horfe touches the egg, its operculum is thrown open, and a small active worm is produced, which readily adheres to the moist surface of the tongue, and is from thence conveyed with the food to the thorax.

I have often clipped off with a pair of scissors some hairs, with the eggs on them, from the horfe; and on placing them in the hand moistened with salvia, they have hatched in a few seconds. At other times, when not perfectly ripe, the larva would not appear, though held in the hand, under the same circumstances, for several hours; a sufficient proof that the eggs themselves are not conveyed to the thorax.

It is fortunate for the animals infested by these insects, that their numbers are limited and kept within bounds, by the hazards they are exposed to. I should suspect near a hundred are lost for one that arrives at the perfect state of a fly. The eggs, in the first place, when ripe, often hatch of themselves; and the larva, without a midge, crawls about till it dies; others are subject to be washed off by the water, or are hatched by the sun and moisture thus applied together; when in the month of the animal, they have the dreadeful ordure of the teeh and mastication to pass through; and on their arrival at the thorax, they may pass, mixed with the mafs of food, into the intestines; and when fully grown, on dropping from the anus to the ground, a high road or water may receive them; if on the common, they are in danger of being crushed to death, or of being picked up by birds, which so cautiously for food attend the footsteps of the cattle. Such are the contingencies, by which nature has prevented the too great increase of their numbers, and the total destruction of the animals they feed upon.

I have once seen the larve of this ophitus in the thorax of an as. Indeed, there is little reason to doubt their existence in the thorax of all this tribe of animals.

The perfect fly but ill sustains the changes of weather; and cold and moisture in any considerable degree would probably be fatal to it. Thrice flies never pursue the horfe into the water; this aversion, I imagine, arises from the chillness of the atmosphere over that element, which is probably felt more exquisitely by them, than by other flies, from the high temperature they had been exposed to during their larva state. The heat of the thorax of the horfe is much greater than that of the warmest climates; being about 102° of Fahrenheit; and in their fly state, they are only exposed to 60°, or from that to about 85°, in very warm weather. Such a change, if suddenly applied, would in all probability be fatal to them; but they are prepared for it, by suffering its first effects in the quiescent and less sensible state of a chrysalis. I have often seen this fly in cloudy weather, and during the night time, fold itself up with the head and tail nearly in contact, and lying apparently in a torpid state, though in the middle of the summer.

I never observed these bots hanging to the extremity of the rectum, previous to quitting it, as the hemorrhoids, or small horfe-bots, are seen to do.

Whether these bots can at all exist in the thorax of a carnivorous animal, I am not at allcen. I gave upwards of a hundred eggs, proved by trials to be ripe, and containing a living caterpillar, to a cat in milk at various times; and on destroying her, at the end of two months after the first portion had been given, I could discover no traces of them in the thorax or intestines.

I gave six of the larve of the large horfe-bot, recently taken from a dead horfe's thorax, and perfectly alive, to another horfe, in a ball made of meal, in the centre of which they were enclosed: their effects on the thorax were not noticeable by any external indications; 27 of them were the next day exhibited to a horfe with the farcy, without their producing any sensible effect.

Of the ophitus hemorrhoidalis, or small horfe-bot. The larva, or grub, producing this infest, is in most respects like the former, occupying the same situation also in the thorax of the horfe: it is easily distinguished by its smaller size, and being nearly or quite destitute of spines, on leaving the rectum; when full grown, it assumes a reddish green colour, and in about two days becomes a chrysalis.

None of the larve of this family of insects appear to change their skin, which at length becomes also the shell of the chrysalis: when squeezed, they forcibly contract themselves into a smaller space, and become very hard. It is probable they in this way refill the violent pressure they must occasionally sustain from the weight of the food, and the actions of the thorax, and in passing through the intestines and the sphenicter ani.
After remaining in the chrysalis state about two months, the fly appears. See the description at the conclusion, and the figure of it in the plate.

It seems hitherto to have been universally believed among naturalists, that the female fly enters the anus of the horse, in a very extraordinary manner, to deposit its eggs. Reaumur received the idea of Vallinier, and Vallinier of a Dr. Gaipari, whose observations I should suspect originated from seeing the *bisperostra equins* teasing the horse, as is very commonly seen; and its getting within the rectum was merely, it is probable, supplied by his fancy and imagination.

The objections to an idea of this sort are these, admitting there was any good foundation for such a supposition; that the anus is rather closed than opened by any irritation externally applied; that the fly would be crushed in attempting to pass the sphincter of a horse's rectum; and having no means of holding, while depositing its eggs, it would be quickly forced out with the dung; and it is evident, that the whole of the ovum, to the amount of some hundreds, must all be deposited in one horse, as it is impossible if the fly survived, it could undergo this punishment a second time; for the heat and moisture of the rectum would at least destroy its wings, and prevent its attaining a second time this situation.

I mention these objections, not as they merely relate to this species, but that it may not be credited of the nafalis, or indeed of any of them, that they really enter the body of the animal, to obtain for their young a situation there.

I have not seen any writer who has conjectured the real mode in which this fly deposits its ovum; which having discovered by repeated opportunities of witnessing it, I can speak of with certainty.

The part chosen by this insect for this purpose is the lips of the horse, which is very distasteful to the animal from the excessive titillation it occasions: for he immediately after its touch rubs his mouth against the ground, his fore legs, or against a tree; or if two are standing together, they often rub themselves against each other.

At the flight of this fly the horse appears much agitated, and moves his head backwards and forwards in the air, to baulk its touch, and prevent its darting on the lips; but the fly, watching for a favourable opportunity, deposits its eggs from the point of the abdomen, and lies continues to repeat his attacks on the lips, till the enraged animal endeavours to avoid it, by galloping away to a distant part of the field. If it then continues to follow, or tease him, his last resource is in the water, where the oefirus is never observed to pursue him.

The teasing of other flies may sometimes occasion a motion of the head familiar to this; but it should not be mistaken for it, as is never in any degree so violent as during the attack of the oefirus.

At other times I have seen this fly get between the legs of the horse whilst he is grazing, and then make his attack on the lower lip. The titillation occasions the horse to stamp violently with his fore-foot against the ground, and he often strikes with his feet as though aiming a blow at the fly. They also sometimes hide themselves in the grases; and as the horse roops to graze, they dart on the mouth or lips, and are always observed to poise themselves during a few seconds in the air, while the egg is preparing on the point of the abdomen.

When several of these flies are confined in a close place, they have a particularly strong fully smell, such as we feel when animals are confined in a close place: and I have observed both sheep and horses, when teased by them, to look into the grases, and smell to it very anxiously; and if by these means they discover the fly, they immediately turn aside, and hallen to a distant part of the field.

The eggs of this species appear of a darker colour than the former, and are provided with a petiolus, or foot-stalk from the end, the opposite being obtuse, and provided with an operculum: it is also ribbed in a transverse direction, unlike the eggs of the preceding species.

Our ancients imagined that poverty or bad food engendered these animals, or that they were the offspring of putrefaction. In Shakespeare's Henry the Fourth, part II, the other at Rochester says, "peas and beans are as dink here as a dog, and this is the next way to give poor jades the bots" and the miserable nag of Petruchio is said to be so "begotten with the bots." When the animal is kept from food, the bots are also; and, it is natural to suppose, are then the most troublesome: wherefrom arose the idea, that poverty or bad food could engender them.

Of the *oefirus ruminans*. This insect was known to Linnaeus, who gave it the name of *nafalis*, from an idea of its entering the nostrils of the horse, and depositing its eggs in the fanae: "Habitat in equorum fanae per nares intranls." Linn. Syll. Nat. 2. p. 97-98. which as it could not well do without destroying its own wings, is probably as much a fable as the "miris per annus intranls." of the preceding species. We have seen four chrysalides of this fly, which were uniformly found under the dungh of horses, which leads to a supposition that they also inhabit the stomach of this animal. The larva is at present unknown; but if it inhabited the fanae of the horse, it would produce such troublesome symptoms as could not easily escape the notice of those whose business it is to attend to the diseases of cattle. Such a disease has, however, never been described; nor after an extensive opportunity, both in the dead and living subje& to have ever seen a bot in the fanae of the horse. Perhaps the bots of the stomach, having crawled to the fauces in search of food, after the death of the animal, might have given rise to this idea: they may have even accidentally bred there; for there is little room to doubt, that these animals can live in any part whatever of the alimentary canal, or the passages leading to it. For a figure of this fly, see also the plate of the oefiris.

Of the *oefirus ovis*. About the middle of June I procured some full grown larve of the *oefirus ovis*, from the inside of the cavities of the bone, which supports the horns of the sheep. They are nearly as large as those of the large horse-bot, of a delicate white colour, flat on the under side, and convex on the upper, having no spines at the divisions of the segments, though provided with two curved hooks at the small end. The other extremity is truncated, with a small prominent ring or margin, which seems to serve the same purpose, though in a inferior degree, as the lips of the *oefirus equi* and hemmorhoidales, by occasionally closing over, and clearing the horny plate of respiration. When this margin opens, after closing over the plates, a flight snap is sometimes heard, from the sudden admission of air.

When young, these larvae are perfectly white and transparent; except the two horny plates, which are black: as they increase in size, the segments of the upper side become marked with two brown transverse lines; and some spots are observable on the fides.

They move with considerable quickness, holding with the tentacula as a fixed point, and drawing up the body towards them. On the under side of the larva is placed a broad line of dots, which, on examination with a glass, appear to be rough points, serving, perhaps, the double purpose of afflicting their passage over the smoother and lubricated sur-
faces of these membranes, and of exciting also a degree of inflammation in them where they roll, so as to cause a secretion of lymph or pus for their food.

"I have mostly found these animals in the horns and frontal sinuses, though I have remarked that the membranes lining these cavities were hardly at all inflamed, while those of the maxillary sinuses were highly so. From this I am led to suspect they inhabit the maxillary sinuses, and crawl, on the death of the animal, into these situations in the horns and frontal sinuses.

"The breeds of these, like the oe. bovis, do not appear confined to any particular season; for quite young and full-grown larvae may be found in the sinuses at the same time.

"When full grown, they fall through the nostrils into the ground, and change to the pupa state, lying on the earth, or adhering by the tube to a blade of grass. The fly buries the shell of the pupa in about two months. The figure is given in the plate; and its description at the conclusion.

"The manner in which this species deposits its eggs, which we have often seen, but not, we believe, ever been described; nor is it easy to see, though standing close to the animal at the time, exactly in what way this is accomplished, owing to the obscure colour and rapid motions of the fly, and the extreme agitation of the sheep; but from the motions of the sheep afterwards, and the mode of defence it takes to avoid it, there is little doubt that the egg is deposited in the inner margin of the nostril.

"The moment the fly touches this part of the sheep, they shake their heads violently, and beat the ground with their feet, holding their noses, at the same time, close to the earth, and running away, earnestly looking on every side, to see if the fly pursues; they also may sometimes be seen smelting to the grass as they go, least one should be lying in wait for them; which if they observe, they gallop back, or take some other direction, as they cannot, like horses, take refuge in the water: to defend themselves against its attacks, they have recourse to a rut, or dry dusty road, or gravel-pits, where they crowd together during the heat of the day, with their noses held close to the ground; which renders it difficult for the fly, who makes his attacks on the wing, to get at the nostril.

"I imagine the nostril, from repeated attacks of the fly, and the consequent rubbing against the ground, becomes highly irritated and sore; which occasions their touch to be so much dreaded by the sheep.

"From the difficult and very precocious mode these flies pursue, and also the hemorrhoidalis, in depositing their eggs, they cannot succeed in depositing but a few in each sheep; whereas, on the contrary, if they actually enter those cavities of the face to effect it, they must deposit them all, and in one subject, the impossibility of which is already stated.

"General observations on the oestrí. Having traced these separately through their various changes, and mode of propagation, it may not be improper to consider their good or ill effects on the animals that are subject to them.

"Though the attention of naturalists is at present occupied with the formation of a nomenclature, and descriptions, to every object of natural history, yet this pursuit, though difficult, and highly important, is not so much the ultimate aim of this science, as a knowledge of their economy and properties; as it is from these we are taught the most effectual means of avoiding the consequences of the injurious, and of protecting such as can be usefully applied to the purposes of mankind. If after mature inquiry, the existence of the oestrí should be proved, in a greater degree, injurious, than beneficial, by any service they can afford, their numbers might be considerably reduced, and a total extirpation of some of the species would not, I am disposed to believe, be altogether impracticable in our insular situation.

"The injury derived from their depredations is principally felt by the tanners, whose hides are often exposed to these animals, as to be considerably damaged; and sometimes the loss of a horse or sheep may be occasioned by the existence of the other species.

"If it were desirable to kill their numbers, the following, I apprehend, would be the most successful means. The larvae of the oe. bovis, or ox bot, which breeds in the backs of the horned cattle, is so conspicuous, that it is more easily destroyed than the others: the injection of any very corrosive liquor into the sinews would kill it, or by puncturing the larva with a hot needle, through the aperture in the flux, or by simple pressure, they may be destroyed, afterwards extracting them, or leaving them to slough away, which I have often observed they do, when enucleated by a blow from the horn of the beast, or by any other accident, without the least injury to the animal. A man employed for this purpose might, in half a day, destroy every bot on a large common, the beasts being suffered to pass by him one by one.

"In respect to the great and small horse-bot, those who have horses which have been much out to graze the preceding year, in countries where these flies are prevalent, might considerably diminish their numbers, by examining the horses occasionally for the bots, during the summer months; when they will be found hanging to the extremity of the rectum, where they remain, especially the hemorrhoidalis, for some days before they fall to the ground.

"The destruction of a single one, at this season of the year, is not only the death of an individual, and its effects, but the almost certain destruction of a numerous family.

"I am induced the more particularly to recommend attention to this circumstance on another account, which is from the necessity there is of preventing the irritation which this animal occasions to the anus of the horse, which at times is highly troublesome. If the horse is used on the road, while the bots are adhering to his part, the irritation becomes particularly distressing, and causes him to move very awkwardly and sluggishly, as though tired; and, if feverish, he soon relapses again into the same awkward way of going; and as this generally happens during warm weather, it is attributed to mere laziness, and severe correction follows, but to no purpose, of which we have two or three times been an eye witness; but, on the removal of the bot, the cure is instantaneous.

"There is no medicine at present known that will detach them from the throat, or intestines, though there are not wanting abundance of insensible nostrums for this purpose among the very numerous professors of horse medicine. An easy and effectual mode for the oe. equis, is to destroy the eggs which are deposited on the hairs, and are readily seen and removed by a pair of tissors, or a brush and warm water.

"In the sheep, it would be much more difficult to prevent or destroy them by any of these means, particularly if they are situate in the maxillary sinuses; as, in this case, even trepanning them would be insufficient, as they would probably lie concealed in the convolutions of the turbinated bones.

"Perhaps the removal of the sheep to a distant pasture, during the months of June and July, whilst the greatest part of the bots are yet on the ground, in a chrysalis state, and not bringing them on such ground again, till the setting in of
of winter, would be the means of destroying them most efficiently; and this process, repeated for two or three years successively, in places where they are particularly troublesome, might prove eventually useful to the farmer: the Laplanders, we learn from Linnaeus, migrate annually with their rein-deer, on account of the bot which infests them.

On the other hand, notwithstanding the apparently unnecessary existence and cruel effects of the *offret*, they are probably not altogether without an use, or were designed by Providence to add, without a recompense, to the numerous sufferings of these laborious and inoffensive animals.

A physiological view of their effects will perhaps best justify their existence, and save them from such an imputation.

The larvae of the *offret*, when applied under proper restrictions, and only to a certain extent, may be of greater utility than from our present very limited knowledge of them we are able to discover; but we may venture to remark, that their effect in keeping up a considerable degree of irritation in the membranes, on which they are situated, may perhaps not imputed be compared to that of a perpetual itch, or blister. Nor is it wanting abundant proof of the utility of local irritations, in preventing the access, as well as in effecting the cure of disorders. We often see a formidable disease quickly removed by blistering the skin, or by irritating the mucous membranes of the throat, or intestines, by a vomit or purg. The appearance of exanthematus eruptions on the skin, and the formation of local abscesses, from the same cause of partial irritation, often relieve a general disorder of the system.

The mucous membranes, and the skin, possess this power, when irritated, in a more eminent degree than all the other parts of the body, and it is to the larvae of the *offret* are applied. Irritating the membranes of the throat, by such means, in other animals, would excite nausea and vomiting: but the horse, not possessing this power, his throat is peculiarly fitted for the filthins of such inhabitants.

How far the access of these dreadful disorders, which sometimes arise of themselves in cattle and horses, and afterwards become contagious, as the murrain, glanders, farcy, &c. may be prevented by these peculiar irritations, it will not be easy to discover, nor whether that singular tendency or disposition in the horse to inflammatory complaints, as the inflammation of the eyes, termed moon-blindness, inflammations of the lungs, and of the bones, &c. may be in any degree subdued by these local irritants.

In confirmation of this suggestion, I may remark, (although I am aware other reasons may be also assigned for it,) that those horses which are not exposed to the bots, more frequently are infected with the glanders, farcy, &c. as those of the army, poll coaches, poll waggons, and dray horses, these being rarely spared, from the nature of their work, to graze on the commons, and thus be exposed to receive them.

If, on a more minute search into their effects on the system, the utility of these native filthins of animals should be established, and, like the leach, or the cantharides, they should be called in aid of veterinary medicine, it would be very practicable to administer them artificially, in any quantity, either by the eggs, or the larvae themselves.

If the stimulus is considered as of too gentle a nature, it is, in some measure, stoned for by its permanency, and the unlimited power of increasing their numbers: at least by the administration of them, in this way, we might accurately ascertain their real effects, and whether they are so fatal as has been imagined.

There seems also to be a principle existing in nature, of leaving no space unoccupied that can possibly afford a situation for the convenient increase of animal existence; hence, perhaps, springs one of the causes for the extraordinary occupation of these parts by these animals.

The characters which appear to be general in the structure of this family are, that the antennae have three articulations, the last almost globular, having a brittle or hair in front; and these antennae are each lodged in a deep excavation of the face. The mouth, a simple aperture, not at all projecting from the head. The *pulpi*, or feelers, are two, of two joints, their extremity globular, sunk in a depression on each side the mouth.

All the species of this extraordinary family at present known are,

*Oeletus bovis*, great ox bot fly. Brownish unpotted wings; abdomen with a black band in the middle, and its extremity with orange-yellow hairs.

*Oe. equi*, or great horse bot. Wings white, with a stripe of black, and two small black spots.

*Oe. bewonnoidalis*, or lesser horse bot. Wings dark, unpotted, abdomen black, base white, and point orange.

*Oe. veterinus*, or natalis of Linnaeus, the redbot fly. Wings unpotted, fides of the thorax, and base of the abdomen, with white hairs.

*Oe. ovis*. The sheep hot fly. Wings transparent, with small spots at the base; abdomen checkered with black and white.

*Oe. turanii*. The rein-deer bot fly. Wings immaculate, thorax with a black band, abdomen orange, posteriorly yellow.

*Oe. canucili*. The American rabbit bot. Black wings, brown thorax, black beyond the middle, posteriorly, on the fides of the thorax, and the base of the abdomen, with yellow hairs. Larva. In the backs of the hares and rabbits of Georgia. The immense size of this *oeletus*, which is more than twice as large as the ox bot of this country, would lead us to doubt, whether it might not have been the inhabitant, originally, of some of those immense animals of that continent, which are now lost. See Lin-Society Tranf. vol. iii. p. 269.

*Oe. lacratus*. Carolina bot fly. Red-brown, face white, with black spots.

Found in Carolina and Georgia.

*Oe. peconum*. Wings brown, thorax grey, hairy, abdomen black, base with white hairs. In the intellines of the sheep, says Fabricius, whose species are to be adopted with great caution; perhaps it is only a dark-coloured female, of the *oe. natalis*. The whole genus has been greatly confounded by Fabricius, and not less by his successor, Prof. Gmelin, who three additional species, *antilopae*, *saecriclus*, and *bominae*, are probably all spurious. The first of these agrees, in all respects, with the female of *oe. equi*, the habitating being false. The second is a variety of the *oe. natalis*, and the third is, perhaps, merely a accidental deposit of *oe. bovis*, in the human body, of which there are numerous instances.

*Oe. Georgianus*. Body and wings black, fides of the thorax white, with two black spots.

It is found in American Georgia; the animal it infests is not yet known. From the cabinet of Mr. Franchillon. It is twice as large as the *oe. bovis*, and very different from any thing yet described.

For the figures of these animals, see the plate of the genus *Oeletus*.

**BOTWAR**, in Geography, a town of Germany, in the circle of Suabia, and duchy of Wurtemberg, seated on a small river of the same name, which runs into the Neckar; 10 miles S. of Heilbron, and 13 N.N.E. of Stuttgart.

**BOTZEN,**
BOTZEN. See Bolzano.

BOTZENBURG. See Boitzemberg.

BOVA, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, the see of a bishop, suffragan of Reggio, situated on the brow of a hill, at the foot of the Apennines, near the sea; 20 miles S.E. of Reggio. Being out of the way of trade and thoroughfare, this place can boast neither of wealth nor agriculture. The villagers in its vicinity carry corn, cheese, and cattle to Reggio; but that being a poor mart, has but small demands, and a little circulation of money. Most of the inhabitants are of Greek origin and race; and emigrated from Albania a few centuries ago. Their common language is Albanese, which is a dialect quite different from the modern Greek and Slavonian languages; and though known in Europe for more than a thousand years, and spoken by all the nations round Albania, still remains without an alphabet, and many of its sounds are not to be accurately expressed either by Latin or Greek letters. Hence it may be inferred, that it is a mixture of the dialects of those Tartarian hordes that overran Macedonia and Greece in the 8th century; to which medley the intercourse with Germans, Italians, and Crusaders, has added a variety of foreign terms. The men can speak Calabrese; but the women, who neither buy nor sell, understand neither tongue but their own, which they pronounce with great sweetness of accent. Swinburne's Travels in the two Sicilies., vol. ii. p. 241, &c.

BOUAGE, a town of France, in the department of the Lower Loire, and chief place of a canton in the district of Nantes; 8 miles S.W. of Nantes.

BOUALLI, a town of Africa, the capital of Loango, so called by the French.

BOVATA terre, in Ancient Law Writers, signifies an ox-gate of land, or fo much as may be ploughed in a year with one ox; by some reckoned at fifteen acres, by others at eighteen, by others at twenty, and by others at thirteen or twenty thallings yearly rent.

This is otherwise called beovtur, and bovovinta terre.

Gen. Char. Cal. perianth small, tripartite, pubescent, en- dcoholic. Cor. petals three, oblong, pointed, concave, longer than the calyx. Stam. fil. pist. sper- miferous, oval, compressed, villose, dimpled at its summit; stigmata two, septic, obtuse. Per. a capsule nearly heart-shaped, compressed, smooth, sharp-edged, dimpled at its summit, and divided into two cells, each of which contains a single oval seed.

It is a small tree which grows in the East Indies, is extremely bitter in all its parts, and is given with successe in fevers. It is also used as a restorative, and an antidote to poisons.

BOUBI, in Ornithology, the name given by the French navigators to the booby of the English. See BOOBY.

BOUBIL, the name by which the Chinefe at Canton denote the crying-thrush, turdus canorus. In other parts of China, the same bird parades under the title of, can-nue. Sonnerat tells us, this is the only singing bird that is known to inhabit the vall empire of China, where it is occasionally kept in cages, for the sake of amusemen, by the fair sex. It infests on rice, worms, insects, &c. The same bird is also called banjoubob. See CANORUS.

BOUBIL, Boobil de la Chine, the name given by Sonnerat to the turdus habitat of Gmelin, and chauising-thrush of La- thain. See BUSIL.

BOUBOU. Le Vaillant, in his History of the Birds of Africa, belows this name on a species of Turdus, the male of which has a remarkable peculiar note, resembling the word 'bouhou', often repeated. This bird was previously described by Buffon, under the title of Merel noir et blanc d'Abissinie: it is also the turdus abissicus of Gmelin.

BOUBOUT, one of the synonymous names of the hoopoe, or hoop, the utapa epos of Linnaeus. See Epops.

BOUC, in Zoology, Geogift bok, Grn. synonymous names of the goat, capra hircus. Boce d'Afriquc, is capra defrufi; and boce de jada (of Buffon) is capra reclusa of Linnaeus; the obidew goat of Pennant.

Bouc Damaoue, the French name of the Linnaen aul- thope grimina; called also by them grimine, and Chiere de grimine.

Bouc-Faisan, or Bouc-fleuin, the names of the wild goat (capra ibex of Linn.), in old French writers. The word is of German origin, being derived from bock, or bone, and flein, a rock or flone; in French, boce de roche; or, as we should render it, the rock, or mountain goat. Thus also, boce de roses, boce quintin, bone fourage, &c.

BOUCANGEKIZ, in Ichthyology, one of the synonymous names of sparus pagell. See PAGEL.

BOUCARDE, or Bucarde, in Conchology. See CAR- DIUM, the cockle.

BOUCHAIN, in Geography, a town of France, in the department of the North, and chief place of a canton in the district of Douay, seated on the Scheldt, and carrying on a considerable trade in corn and cattle. The place contains 1,128, and the canton 13,500 inhabitants; the territory comprehends 1524 kilometres and 20 communes. Bouchain is a strong town; it was taken by the duke of Marlborough in 1711, after a siege of 30 days, retaken in the following year by maréchal Villars, and invested by the Austrians in 1705, but soon relieved; 3 leagues S.W. of Valenciennes, and 23 N.N.E. of Cambrai.

BOUCHARDON, Edme, in Biography, an eminent French sculptor, was born in 1608 at Chaumont in Beaujaly, where his father was a sculptor and architect; and educated at Paris, in the school of Coustou the younger. At Rome, whither he removed as the king's pensioner, to which his merit advanced him, he cultivated, with affluence and success, his talent for design, by copying the precious remains of antiquity, as well as the works of modern painters. He afterwards settled at Paris, and, notwithstanding his singular simplicity of character, became eminently distinguished, so that he was employed in several works of importance; the principal of which are the fountain in the rue de Grenelle, fay- bourg St. Germain; a statue of Love making a bow of the club of Hercules, with the arms of Mars; and the equerelian statue of Lewis XV. at Paris. In 1736, he was appointed designer to the Academy of Belles Lettres; and, in 1744, he was admitted into the Academy of Painting, of which he was made professor in 1746. Having acquired a decent fortune, by his industry and regularity, and attained high eminence in his art, he died in 1762. His compositions are formed in the style of simple antiquity, and more admired for correctness and good taste, than for force of expression or vigour of imagination. His drawings are highly esteemed; they have furnished various engravings; and a Treatise on Anatomy, for the use of artists, published by Huquieres in 1741, is illustrated with figures by his hand. The chief amusemen of this artist was music, which he performed in a masterly stile. D'Argenville's Vies des Sculpteurs. Gen. Bio.

BOUCHARI, or Pouchari, also Bouchier, Boucherie, &c, in Ornithology. These are the common names of the grey-
BOU

grey-backed shrike, Lanius excubitor, in Burgundy. The words are derived from the English butcher-birds, an epithet applied to us, in a general manner, to all the species of the shrike, or lanius genus.

BOUCHE, Martin, in Biography, an engraver, who flourished in 1680. He was chiefly employed by booksellers; and portraits were his principal performances. He worked together with the graver, in a neat but difficult style; and his portraits, several of which were those of Jefuits who suffered in England about his time, are not deficient of merit.

BOU, Boce of court, the privilege of having meat and drink at court feet-free.

The word is also written bouce, bougee, and budge; it is mere French, where it signifies mouth. The French still use the phrase, Avoir bouche a la cour; that is, to have table or diet at court.

This privilege is sometimes only extended to bread, beer, and wine; it was a custom anciently in use, as well in the houses of noblemen as in the king's court.

Thomas earl of Lancaster retained for John de Eure, to serve him with ten men at arms in time of war, allowing them bouge of court, with livery of hay and oats, hores-faces, and nails. Sir Hugh Merril had the same privilege for life, on condition of serving king Edward II. Kennet. Gloss. ad Paroch. Ant. p. 378.

BOUCHE d'Arget, in Conchology, the trivial French name of a shell of the turbo genus, the mouth, or opening of which is silvery within. Linnaeus calls it Turbo argyrofusus; the English silver-mouth turbo, or silver-mouth.

BOUCHE d'Or, as in the former, a trivial sort of expression among the French collectors for the Linnæan Turbo Chrysalis, the mouth of which is of a fine golden hue. This is the gold-mouth turbo of the English.

There are a number of other shells, distinguished in like manner, by the colour of the mouth, to each of which a characteristic epithet is given; but such names are always capricious, and liable to be misapplied, because they are the names in common use among the dealers in shells, and others, who have only a flight acquaintance with the subject of teneology. It is always better, therefore, to retain the names assigned to them by Linnaeus, and other Latin authors.

BOUCHEMAINE, in Geography, a town of France, in the department of the Maine and Loire, and chief place of a canton in the district of Angers; 5 miles S. of Angers.

BOUCHENE, a town of Perig, in the province of Korolane; 20 miles N. of Herat.

BOUCHE, Francis, in Biography, a modern French painter of celebrity, was born at Paris in 1706, first educated under Le Maine, and finished his studies at Rome. Upon his return to Paris, where he settled, he obtained, by the style of his painting, the appellation of the "painter of the graces," and the "French Albanian." He was advanced to the post of first painter to the king, and that of director of the Academy of Painting, after Vazloo; but he was carried off by a premature old age in 1770. His character was social and frank, without envy or avarice; he was always ready to bestow his works on those who admired them, and liberal in his encouragement of young artists. Of his singular modelly we have an instance, in his refusal to retouch a picture of one of the first Italian masters, alleging, "Such works are holy vessels to me." His works were held in high estimation. He possessed great fertility of invention; but, says Mr. Strutt, he was defective in correctness and grandeur of design. He executed some fine etchings from his own compositions, and those of other masters. Strutt. Nouv. Dict. Hist.

BOUCLIER, John, a furious fanatic, was born in Paris, where he became professor of philosophy and theology, and afterwards rector, in 1580. He was also prior and doctor of the Sorbonne, and was made rector of St. Benoist. As a preacher and a writer, he was a leading and active promoter of the league against king Henry III.; the rebels first assembled in his apartments in 1585; and he ordered the alarm-bell to be rung in his church, which contributed to excite the popular insurrection of that year. He has been charged with instigating James Clement, a Dominican monk, to the assassination of Henry; however this charge he is called to account. He was a very opposite to the success of Henry IV., against whom he branded from the pulpit and from the press. Nor did his opposition cause with the king's abjuration; for pretending that he was a feguen convert, and that the pope's absolution was invalid, he published "Nine Sermons" on the subject, which he had preached at Paris in 1593. When the Parissians received Henry into the capital, these sermons were publicly burnt, and Bouclier, perfiling in the party of the leaguers, fled with the Spanish garrison, in 1594, into the Low Countries. At Tournay he obtained a canonry; and, after a residence of 50 years, he died, of that chapter, in 1644. As a feguen name he is supposed to have written an apology for John Chatelet, who made an attack on the theories of Henry IV. and also for the Jesuits, who, in consequence of it, were bannished from France. So atrocious was his virulence as a partisan, that he justified the conduct of those wretches who had hanged the first president Brillem, and dignified them with the title of martyrs of Jesus Christ, after they had been executed by the duke de Mayenne for that murder. It is said, however, that, towards the close of his life, he regretted living among the enemies of his country, and manifested some signs of repentance for the atrocities of which he had been guilty. Gen. Diét.

BOUCHER, John-Joseph, born at Lisle, the 25th of March 1715, was, in succession, physician to his native city, corresponding member of the Academy of Sciences, and foreign associate of the Royal College of Surgery at Paris. He published, in 1751, "Methode abrege pour traiter la dyfenterie regnante a Lisle en 1750," &c. He also furnished the Journal de Medicine with "Meteorological Observations" made at Lisle, and with other philosophical papers. Eloy, Dict. Hist.

BOUCHER, in Geography, a town of Perig, in the province of Perigord, on the north coast of the Perigord gulf; 160 miles S.W. of Schiras.

BOUCHOUX, a town of France, in the department of Jura, and chief place of a canton in the district of St. Claude. The place contains 1,850, and the canton 6,094, inhabitants; the extent of the territory comprehends 1271 kilometres and 13 communes.

BOUCLANS, a town of France, in the department of the Doubs, and chief place of a canton, in the district of Defancon; 8 miles E. of Defancon.

BOUCHE, in Fab AE, etymology, synonymous with cyclopæbre the French name of the Cyclopterus genus of fishes.

BOUCHE, Écaillet de tortue, in Conchology, the name given by the French collectors to those shells of the hirpa genus whose colours, and general form, bear some resemblance to the scale of a tortoise. The most remarkable species of this kind is paela eestinaria of Linnaeus.
Enloology, the town thorax most. 2 and canton, Le. Illigeath, the thie not Biography, small town transverse See dark 4 in hltlc thorax 1 race Rhodes, 5 in the genus the 3 believed, in leagues L'ohfciir namely, the and peltis. The genus peltis, forgoing aftly unequal horned, eleven large, and clubbed, and the last almost oval. The mouth is furnished with horny, simple mandibles; acutely pointed jaws; and four unequal fihron feelers; and lastly, the tars are fihron, and composed of five joints.

Insects of this tribe were formerly confounded with those of cafidis, dophorus, pbarvum, microporus, opunam, and until, from all of which they are to be discriminated by the foregoing character of bouclier.

There is another very analogous genus to this, namely, peltis of Fabricius. Peltis was a name given many years ago by Geoffroy to the insects afterwards called filpha by Linnaeus. It was again taken up by Illiger, who bestowed it on a new genus of coleopterists established by him, in which the Linnean species of filpha, griffa, ferruginea, oblonga, and limbata, were comprised. The genus peltis is adopted from Illiger by Fabricius, in his last work on coleoptera, Syllena Eleutheratorum. It will be therefore proper to point out exactly in what particulars these two genera differ. The peltis has the lower lip truncated and ciliated, while in the boucliers that part is dilated and bifid; there is some dilimilitude in the external character of the two genera, and their habits of life are distinct. See PELTIS.

The boucliers exhale a most fctid odour. Commonly they are found feeding upon cadaverous carcasses, the dung of animals, or other fuch filth. There can be no doubt that the fench of these insects affects even the animal matter which they crawl upon, and on which they subsist. When taken in the hand, these beetles fput from the mouth, as well as from the anus, a drop of liquor of a dark or black colour; the fcellency of which is thick, and the fench difgusting. This liquor is not produced by violence or compression; it is voluntarily discharged by the creature, and is, beyond dispute, a secretion prepared by nature to promote the putrefaction of the fcell it may chance to meet with, as is only in that state that the boucliers feed upon it.

Oliver describes only a few species of this family; namely, le thoracique, which is black, oval, and depressed; thorax fawn colour; and wing-cases with elevated lines. Le littoral is black, long, with three elevated lines on the wing-cases, and a tranverse protuberance. Le robustus is black; the wing-cases rugged, with three elevated lines; the thorax rugged likewise, and fumous behind. L'atene is very black, with an entire thorax; the wing-cases dotted, with three smooth, elevated lines. L'obere is black, slightly convex, with the wing-cases dotted, and three elevated lines obfconely marked. Le quadrupline is oval, depressed, and black; the wing-cases of a pale yellow, with two black dots on each. These are all the boucliers mentioned.

BOUCNASCH, in Geography, a town of Germany, in the duchy of Holstein; 5 miles E. N. E. of Rendsburg.

BOUCOIRAN, a town of France, in the department of the Gard, and chief place of a canton, in the district of Uzes; 3 leagues W. of Uzes.

BOUCONVILLE, a town of France, in the department of the Meuse, and chief place of a canton, in the district of St. Mihiel; 2 leagues E. of St. Mihiel.

BOUDHA, in Indian Mythology. See BODHI.

BOUDIN DE MER, in Zoology, the name given by Vol. V.

BOUCOIRAN, a town of France, in the department of the Gard, and chief place of a canton, in the district of Uzes; 3 leagues W. of Uzes.

BOUÉE, in Geography, a town of France, in the department of the Meuse, and chief place of a canton, in the district of St. Mihiel; 2 leagues E. of St. Mihiel.

BOUÉD, in Entomology, the epithet under which the overall is distinguished in some countries.

BOUÉE, in Geography, a town of France, in the department of the Meuse, and chief place of a canton, in the district of Commercy; 5 leagues S. E. of Bar-le-Duc.

BOUÉLLES, a town of France, in the department of the Somme, and chief place of a canton, in the district of Amiens; 2 leagues W. S. W. of Amiens.

BOUÉNA, the most easterly of the lieers islands to the coast of Toulon, in the Mediterranean, on the coast of France. See HIERES.

BOVENDEN, a town of Germany, in the circle of the Upper Rhine, and principality of Heife-Rhinefs; 4 miles N. of Gottingen.

BOUES, a town of France, in the department of the Somme, and chief place of a canton, in the district of Amiens; 12 leagues S. E. of Amiens.

BOUXIERE, L., a town of France, in the department of the Ile and Vilaine, and chief place of a canton, in the district of Vitre; 10 miles N. E. of Rennes.

BOUFFE, in Zoology, a race of dogs with fine, long, frizzled hair; a croc breed between the baschet and great spaniel.

BOUFFERS, ROUS-BOUM, in Biography, duke, peer, and marshal of France, and a celebrated general, was the son of Francis count of Bouffers, and born in 1644. In 1669, he became colonel of dragoons, and served in the conquest of Lorraine under marshal Crequi; and in the war
against Holland he distinguished himself, under Turenne, in several battles and sieges. He afterwards served in Germany, on the frontier of Spain, and in Flanders; and at length was made general of the army on the Moselle, in 1690. After several services of importance at Mons, Liege, Luxemburg, and Namur, &c., he was advanced in 1693 to the rank of marshal of France; and, in the following year, he was made governor of French Flanders and the town of Lille. In 1699, having held out 43 days against the united forces of the allies under King William at Namur, when the place capitulated, he was arrested prisoner of war; and upon his remonstrance that the whole garrison, which had not been surrendered by the French, according to the articles of war, should have been retained rather than himself, he was answered, by the compliment, "Sir, you are esteemed at 10,000 men." He afterwards conducted the conference which terminated in the peace of Ryswick. In 1708, he acquired great glory by an obstinate defence of Lille for four months, when it was threatened with a siege by Marlborough and Eugene. On this occasion he displayed his magnanimity, by his noble declaration to a person who represented to him the facility of killing prince Eugene; "Take him prisoner," says he, "and your fortune is made; but expect the most severe punishment, if you undertake any thing against his life."

At the battle of Malplaquet, he conducted the retreat, so as to lose neither cannon nor prisoners. Having established the character of a true patriot, as well as that of a great commander, he died at Lointainville, in 1711; at the age of 68. "His heart," said Madame de Maintenon, "was the last part that died." Nouv. Dict. Hist. Gen. Biog.

BOUFFLES, in Geography, a town of France, formerly called "Cagny," in the department of the Oise; 7 miles W. of Beauvais.

BOURFAMONT, a town of France, in the department of the Voges, and chief place of a canton, in the district of Neufchatel; 2 leagues S. of Neufchatel.

BOUGAINVILLE, John Peter de, in Biography, was born at Paris in 1722, and educated at the college of Beauvais. The first exhibition of his literary character was in a prose translation of "Anti-Lucrertius," with a preliminary discourse. Amongst the friends and patrons, procured for him by his distinguished literary talents and amiable qualities, was M. Pierret, secretary of the Academy of Incriptions and Belles Letters, by whom he was introduced into that society, and whom he succeeded in his office. Of the various papers, which he wrote for the Memoirs of the Academy, two of the most considerable are those on the voyages of Pythas of Marseille, and of Hanno the Carthaginian. In 1754, he was admitted into the French academy; and appointed censor-royal, and keeper of the antiques in the Louvre. He also published "A parallel between Alexander and Thamos Kuli Khan; and edited Pierret's Chronology. He died of an asthma, to which he had been subject from his youth, at the castle of Lories, in 1763. Nouv. Dict. Hist.

BOUGAINVILLE, M. D. F. a native of France, and the first perfon of that country who circumnavigated the globe. His nautical discoveries were very numerous, and he occupies a high rank among those who have extended our acquaintance with distant seas and islands. He was killed by the mob in a tumult at Paris, May 16, 1792.

BOUGAINVILLE bay, in Geography, lies in the straits of Magellan, on the north side.

BOUGAINVILLE island, an island of the South Pacific ocean, adjoining a group of other islands, with which it forms a bay not less than 15,000 toises in extent, seen by M.
rather who applied them, for these purposes; but, as the name bougie is of French origin, it may be the invention of a French surgeon, and perhaps of Guido de Cauilaco, (who flourished before the existence of Syphilis in Europe); for this surgeon, in his chapter "De ulceribus anchuranum, &c." Chir. Mag. Traet. IV. Doct. II. cap. 7, recommends the "Turundal ex cera," to be passed up the urethra.

The materials commonly used recourse to, in the fabrication of bougies, catheters, and swabs, during the sixteenth century, were gold, silver, and lead; but these metallic rods were not sufficiently pliable and soft for introduction into a diseased urethra, surgeons afterwards used bougies formed of slips of linen or silk, dipped in melted wax, &c and rolled into the size of a goose-quill, of sufficient length to pass as far as the neck of the urinary bladder. This kind of bougie was greatly improved by Mr. Daran, of Paris, who, nevertheless, made use of some very ridiculous and useless ingredients in the composition of them; such as sheep's dung, pulverized shoe-leather, port wine, and live pigeons; not to mention various other ingredients, equally needful, though not quite so absurd and pretentious.

As it is now generally admitted by surgeons that bougies act mechanically only, and not medicinally, in curing diseases of the urinary canal, we shall proceed to describe the properties and composition of waxen or platter bougies; after which we shall notice the elastic bougies, and shall offer a few hints on an invention by Mr. Smyth, of London, who has lately contributed to the revival of metallic instruments, which had almost been wholly laid aside, on account of their wanting due flexibility, &c.

The properties required in a bougie for dilating a contracted urinary canal are, 1. Sufficient firmness to overcome the resistance of the stricture; 2. A degree of flexibility, which shall yield and accommodate itself to the windings or tortuosity of the morbid canal; 3. So much strength, cohesion, or tenacity, as not to be in danger of breaking; 4. Perfect smoothness of surface, that it shall occasion no uneasiness of difficulty in passing; 5. A mildness in its composition, which may ensure its remaining for a sufficient time in the urethra, without exciting pain or inflammation.

That it is possible to communicate a medicinal quality to bougies, cannot be denied; and it having been an old opinion that strictures were usually attended with ulcers or abrasions in the urethra, which required healing, surgeons have frequently employed medicines in the composition of bougies, supposed to possess a power of cicatrizing these ulcers: but of late, both the remedy and the disease have been exploded; we do not any longer suspect venereal ulcers as a coining symptom of stricture, and therefore have discontinued what were called cicatrizing applications. Still, however, the idea of employing mercury in this way, is not wholly given up; and there are medical practitioners who prefer bougies containing a large proportion of the specific, believing that it tends to eradicate any venereal taint in the system; but the major part of the profession consider mercury as entirely useless in these cases; because, if there happens to be any venereal taint in the constitution, this mode of administering mercury would not be the most eligible for the cure; and because the addition of such an incongruous article to the other ingredients, has the effect of diminishing the tenacity of the bougies. A prescription formerly in vogue, and which therefore had been received into the last edition of Chambers's Cyclopaedia, consisted of Burgundy pitch, two ounces; quicksilver, one ounce; and crude antimony in powder, half an ounce.

The objection against antimony, and such like brittle materials, will undoubtedly be urged with at least as much force as that we have already made against mercury; and on this account we recommend that no mineral sublimate shall be employed in such quantity as to lessen the tenacity or cohesive nature of the platter composition.

The bell formed platter bougies may, without any injury, be varied in the proportion of their ingredients, or in the colouring matter they contain, according to the temperature of the weather, or the intention of the surgeon. They may be coloured red, with a little cinnabar; white, with ceresine; black, with athiop, &c; and in warm weather, or a tropical climate, they should be made of a firmer confidence than in a cold country. The balls of all platter bougies should be wax and oil; the wax may be either yellow or white; the oil, either vegetable or animal; to which may be added, a small proportion of resinous matter, &c; to afford the degree of confidence and tenacity we require. The ingredients should be well boiled and incorporated together, especially when there is the addition (usually made) of lathargic or minium in considerable quantity.

The following are among the most simple and approved compositions for platter bougies:

N° I. R. Gum lac, one pound;
Litharge platter, three pounds:

Dissolve the gum in the platter by slow boiling, and add of yellow wax two pounds. After about three hours more boiling, the whole may be set aside for use.

N° II. R. Olive oil, three pounds;

Yellow wax, one pound;

Minium, one pound and a half.

These articles are to be boiled slowly for six hours, or even longer in the winter. If the mass be not of a sufficiently firm confidence, add three or four ounces more of the wax.

N° IV. R. Litharge platter three parts, and
White wax two parts; to which add as much olive oil or hog's lard as will give the confidence required.

Boil them as before.

N° V. R. Yellow wax, one pound;
Sperma ceti, half an ounce;

Acetated ceruse, from two to eight drams, according to the degree of solidity desired. Small bougies are to be made of a thicker mass than larger, especially for a hot climate.

N° VI. R. Yellow wax, four parts;

Oil of olives, three parts;
Sperma ceti, one part.

Boil them gently together for two hours, or until they are properly incorporated.

As prescriptions of this sort may be varied at pleasure, it is unnecessary to increase the number of our formulae; the above compositions are to be used in a melted state, but not very hot. Slips of soft linen or calico, of a fine texture, and not less than eleven inches in length, are to be dipped into the warm mass, or spread over with some of it by means of a broad spatula, and care should be taken to make the surface of this cecloth as smooth and uniform as possible. Some persons advise that the slips of fine rag shall be of different lengths, from eight to eleven inches, and about three in breadth; these slips are then to be rolled up loosely, and taking hold of one extremity with the left hand, let it fall upon the surface of the platter, and then draw it out gently. As it is drawn out it will unroll, and take up a quantity of platter on the surface, equal to the thickness of a wafer or a thong; though, to facilitate the unrolling of the rag, it will be proper to allit its motion with the end of the spatula,
tola, or some other instrument. The plater, however, must be warm enough to soak through, and discoulour the rag, otherwise it will not make so good a bougie.

If the clot be exactly three inches broad, it will make fix bougies of a moderate size; but their size may be suited to the occasion. It is generally advisable that the bougie should be smaller at the end which is introduced through the stoma, than at that which is left out at the penis. For this purpose many cut off a part of the oblong square before mentioned, in such a manner as to reduce it almost into the shape of a long right-angled triangle; but as this way of cutting it weakens the bougie excessively, and as it is not at all necessary that the bougie should be taper from one extremity to the other, it is much better to cut down a little slope of about an inch and a half long from the end that is to be palled into the urethra, which will lessen it where it is necessary to be small, and leave it strong in the other part, where the diminution is not necessary.

The platter, when taken up by the cloth, when dipped, will have little bubbles upon its surface, and not be so smooth as if it had been spread therefore in its crude state, a little warmed, may be palled over the platter before it be cut into bougies, which will render it more compact and even. It is a much more exact and speedy method to cut the bougies off with a knife and ruler than with scissors. When they are rolled up, it must be with that side outward which is covered with plater; and they must first be rolled by hand as close as possible, before they are rolled upon a board or marble; for upon this circumstance the neatness of the bougie depends.

It seldom happens that a bougie is required to be more than a quarter of an inch in diameter, or three quarters in circumference; but the generality of practitioners are apt to err in using them of too small a size to produce any permanent advantage in overcomig the stoma. There is undoubtedly a great difference in the calibre of the urethra of different persons, and we have known the plater composition to have been forced off the line by a patient having used the bougie too large, so as to collect the plater in a mass within the urinary canal; but we will lay it down as a general rule to employ the instrument as large as can be conveniently introduced, and again withdrawn from the urethra, although by no means so large as to hazard the accident here alluded to.

Some surgeons have very highly extolled the utility of bougies made of catgut, because of the property they possess of becoming dilated by the moisture of the urethra, and thus enlarging the contracted part of the canal. We have, however, been much disappointed in our expectations from catgut bougies; as they did not dilate with sufficient force upon the exact spot in which the disease existed, and therefore tweddled generally without advantage; nay, it even happens that the catgut, if it be large, will not come away without difficulty and pain, since it dilates equally beyond the stoma itself, as well as on the contracted part; and if it be not sufficiently large, its softness renders it of no utility whatever. As there is no possible mode in which the catgut can do any good, but by mechanically extending the stoma, and as this can only happen for a few moments while the instrument remains firm, it must be obvious to every reflecting person that this kind of bougie is likely to be even less useful than those made of plater or crepe-cloth; and this is precisely what we have observed as the result of our own experience.

Practitioners, being in some respects dissatisfied with the bougies commonly used, have introduced pieces of smooth whalebone, or long strips of leather, for the same purpose: but we think, upon the whole, they are liable, at least, to as strong objections as any we have already mentioned; and the trials made with them, by several surgeons, have not at all produced a conviction of their superiority. At present, indeed, they seem to be entirely laid aside.

Another species of bougie, which deserves much more attention, is composed of catgut internally, and covered by a thin layer of diffused elastic gum, or caoutchouc. The manufacture of this elastic vegetable substance is confined to a very few hands. We believe it was first applied in a state of solution to the purposes of surgery, either by Mr. Teden, a Prussian surgeon, or by M. Bernard, of Paris; but bougies of this kind are also made in other countries, especially in Sweden and Germany, and lately by Mr. Walsh, of London. The mode of diffusing and drying the caoutchouc is kept as a secret. It is said, however, to be soluble in ether and in linseed oil: it may likewise be rendered fluid by cutting the substance into slips, and burning them; but the great difficulty is in retorting it to a state of solidity and dryness, so as to render the bougies useful after they are fabricated and covered with caoutchouc. These bougies, when properly made, are not only very flexible and smooth, but may remain a considerable time in the urethra without being greatly injured. When they crack, or become rough on their surface by repeated use, they are unfit for our purpose, and should be exchanged for new ones. See the articles Catheter and Caoutchouc.

It has formerly been the practice of some surgeons, in using any of the several kinds of bougies already described, to daub their surface over with different stimulating unguents, &c. And it has been imagined that the puriform discharge thus produced from the urethra, had a tendency to diffuse the callosity of the stoma or caruncle, which they supposed to be the occasion of the obstructed urine. Now this is an entire fallacy, founded on a fallacious theory; for neither is there any proof of the existence of such caruncles and callosities in the urethra, nor (if they really did exist) could the suppuration produced by such means afford material advantage. Any stimulating sub stance introduced into the urethra, for example a common plater bougie, may produce a discharge of matter, especially in very irriTABLE patients; but this discharge arises from the whole internal surface of the canal to which the bougie has been applied, and not exclusively, or perhaps, not at all, from the obstructed part where the stoma exists; and this suppuration is no more than the common result of the application of a mechanical stimulus, or foreign body, to a delicate secreting membrane. If that portion of the bougie which came into contact with the diseased part be covered with mucus or pus than any other, this circumstance is probably owing to a greater irritation or increafe of action in the secreting arteries of that part, in consequence of its preternatural irritability; but, by introducing a bougie composed of active ingredients, or smearing its surface over with acid materials, we excite an unhealthy action not only in the morbid part of the urinary passage, but also along the whole extent of the found surface. The reasoning here employed against so absurd a practice, will apply likewise against the use of what have been called "Medicated bougies," which have been ignorantly supposed to poxsee some healing or medicinal quality.

The only remaining bougies we intend to notice in the present article, are those which Mr. Smyth, an apothecary of London, has recently fabricated, of a flexible metallic composition. Although he has not published his invention, (if indeed it be a new compound of the metals,) we think
the instruments of Mr. Smyth deserving our consideration. Experience, in a great number of cases, warrants the use of them, and particularly those of a large size; on account of the extreme smoothness of their surface, the yielding or flexible property they have, without breaking, and the length of time which patients may wear the bougies (where it is necessary to retain them in the bladder) with ease to themselves, and without eroding the metal.

We cannot, however, divest ourselves of an objection, which has too much foundation in truth, against the small-sized metallic bougies, viz. that there is great danger of tearing or penetrating the urethra in passing them; so that they can hardly be trusted with safety in the hands of inexperienced persons, or even of young surgeons who may not be adepts in this line of practice. Mr. Smyth has certainly obtained very respectable testimonies in favour of his instruments; but, we think, on perusing his late publication, that the comparative advantages and disadvantages of these bougies are not always detailed with sufficient precision. Some of the objections, which were formerly made by one of the surgeons of the Lock Hospital, in the fourth volume of the London Medical Review, do not apply to the larger sized metallic bougies; and we are assured that, since the period alluded to, the inventor has improved the form of his instruments so much as to have obviated the little difficulties then suggested by Mr. Blair. It was our duty to lay this, in justice to the inventor; and we doubt not, that by further trials and observation, it will be found that Mr. Smyth's bougies and catheters are entitled to the patronage of surgeons in general. We do not mean to affirm, that they will exclude the use of all other kinds of bougies and catheters; but only that they are highly serviceable, (and even to be preferred to any others) in some particular circumstances of diseased urethra, or retention of urine, &c.

We refer the observations we have to make on caustic bougies for a future article on the subject of Structure, where the history and treatment of this morbid affection will properly come under consideration. In the interim, we refer our readers to the several publications of Mr. Home and Mr. Whatley; and to a paper, in the 18th number of the London Medical Review, p. 209, vol. iv. entitled "Reflections on the use of caustic substanctes and metallic bougies in strictures of the urethra, by Mr. Blair, surgeon of the Lock Hospital, &c."

BOUGIE, in Geography, lies on the coast of North Carolina, between Core Sound and Little Inlet.

BOUGINESE, or BONIANS, a denomination distin- guishing one of the various nations who inhabit the island of Cebuces. These and the Macaffers are the most known. The Bouginoes are at present the most powerful people in this island, though, about a century ago, they were not comparable with the Macaffers. They are of a middle stature, strong, and muscular, and of a light brown complexion. Some of them, especially the women, are nearly as fair as Europeans; and they have pleasing countenances, except that their noses are somewhat flatish. The females are ardently addicted to sensual pleasures, and ingenuous in every refinement of amorous gratification; and on this account, the Bouginoe girls are preferred, throughout the coast, both by Europeans and by Indians. The Bouginoes are generally called by the English Buggeffes.

BOUGLON, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Marmande; 4 miles N. of Castel Jalous. The place contains 681, and the canton 5,547 inhabitants. The territorial extent comprehends 162½ kilometer, and 12 communes.

BOUGUER, Peter, in Biography, a celebrated mathematician, was born at Crofie in Lower Brittany, Feb. 19, 1698. He was the son of John Bouguer, royal professor of hydrography, and author of a complete treatise on Navigation, first printed in 1698, 4to. and reprinted in 1706. In this comprehensive and excellent work, the author correctly delineated the state of navigation at that period.

Bouguer, the son, was initiated by his father in the mathematics, at a very early age; and such was his proficiency, that at the age of 11 years, he instructed his regiment in the Jesuits' college at Vannes; and at the age of 13, he detected the error of a professor of mathematics, who, mortified at being thus exposed, quitted the country. Although he lost his father at the age of 15, and before he had finished his studies, he was thought competent to be his successor in the office of hydrographer; and he discharged the duties of it with great reputation, even at this early age. In 1727 he obtained the prize, proposed by the royal academy of sciences, for the best method of mapping ships; in 1729, that, for the best method of observing the height of the stars at sea; and in 1731, that, for the most advantageous means of observing the variation of the compass. In his piece concerning the best method of observing the height of the stars at sea, he affirms the honour of having been the first person who undertook to give a legitimate solution of the "Solar"; for he calls the curve, traced by a ray of the sun, in its descent through the atmosphere. But though he did not seem to have known it, Mr. Taylor, in his "Methodus incrementorum directa et inversa," had obtained, by an elegant analysis, a flucational equation, which gave all the points of the curve. However, Bouguer's method was the first that was applied to use for astronomical purposes. Bouguer, in his "Optical essay on the gradation of light," published in 1729, examined the intensity of light, and determined its various degrees of diminution, in passing through different pellucid substanctes, and particularly that of the air traversing through the atmosphere. An extract of this first essay was given by M. Mairan in the Journal des savans, for 1739. Dr. Priestley in his "History of light and colours," p. 544, &c. has given a particular account of Bouguer's observations on this subject. At Havre, whither he removed in 1730, he became intimately connected with several members of the Academy of Sciences; in the following year, he was chosen to succeed Maupertuis as associate-geometer; and in 1735 he was promoted to the office of pensioner-astronomer. On the 16th of May in this year, Bouguer left France, on a commission, in which he was joined with Godin and La Condamine, for measuring a degree of the meridian in South America; and he returned to his own country from this expedition in June 1744. Of his various operations, he gave an account to the French academy in November following; and this account was printed in the Memoirs for 1744, and afterwards in his treatise "De la figure de la terre." The principal scene of this laborious undertaking, was the Cordilleras mountains; and in the execution of it, Bouguer and his associates made many other important and useful observations, besides those that related to the immediate object of their commission. To Bouguer in particular, we are indebted for many curious remarks on the expansion and contraction of metals, and other substanctes, by the sudden change of heat and cold, among those lofty mountains; on the reflection of the atmosphere from their summits, and on the singular phenomenon of a sudden in-
create of refraction, when the star can be observed below the line of the level; on the laws of the different densities of the air at different heights; on the effect of the attraction of the moon on the small grains of a plummet; on the method of determining the places of navigators in computing their course and distances; on the new construction of a log for measuring the distance, and on a variety of other particulars; which, with those already noticed, will be duly noticed in the course of this work. Of his deliberation for determining the distances of the larger planets in a telescope with two objects, his experiments on the reflection of the pendulums, and his method of measuring the force of light, etc., we shall introduce an account in their proper

The principal works of M. Bouguer, that have been sep
parately published, are: "The figure of the earth, determined by the observations in South America," 1749, 4to.; "Treatise on navigation and pilotage," Paris, 1752, 4to., abridged by La Caille in one volume, 8vo., 1768; "Treatise on ships, their construction and motions," 1750, 4to., and "Optical treatise on the graduation of light," first published in 1728, and afterwards in 1769, 4to. The following detail of his chief communications to the royal academy, and of the volumes of the "Memoires," in which they may be found, will probably gratify the curiosity, and direct the researches of our mathematical and philosophical readers. Accordingly, we have in the "Memoires" for 1746, a comparison of the force of the solar and lunar light, with that of candles; for 1751, observations on the curvilinear curve of bodies in mediums; for 1752, upon the new curves called the "lines of pursuit," for 1753, to determine the species of conoid, to be constructed upon a given base, which is exposed to the shock of a fluid, so that the impulse may be the least possible; and a determination of the orbit of comets; for 1754, comparison of the two laws which the earth and other planets must observe in the figure, which gravity causes them to take; on the curve lines proper to form the arches in domes; for 1755, observations on the equinox; on the length of the pendulum; for 1756, on the length of the pendulum in the torrid zone; on the manner of determining the figure of the earth, by the measures of the degrees of latitude and longitude; for 1757, on the astronomical refractions in the torrid zone; observations on the lunar eclipse of September 8th, 1757, made at Quito; for 1744, short account of the voyage to Peru by the members of the royal academy of sciences, to measure the degrees of the meridian near the equator, and from thence, to determine the figure of the earth, a communication no less elegantly, than accurately written; for 1745, experiments made at Quito, and divers other places in the torrid zone, on the expansion and contraction of metals by heat and cold; on the problem of the sailing of ships; for 1746, treatise on ships, their structure and motions, (see Meticentre and Ship); on the impulse of fluids upon the fore parts of pyramidoïds, having their base a tra
pezium; continuation of the short account, given in 1744, of the voyage to Peru, for measuring the earth; for 1747, on a new construction of the log and other instruments for measuring the run of a ship; for 1748, of the diameters of the larger planets; the new instrument called a heliometer, proper for determining them, with observations of the fun; observation of the eclipse of the moon, Aug. 8th, 1748; for 1749, second memoir on astronomical refractions, ob
served in the torrid zone, with remarks on the manner of constructing the tables of them; figure of the earth, determined by Meißrs. Bouguer and Condamine, with an abridgement of the expedition to Peru; for 1752, observations of the lunar eclipse, Dec. 13th, 1750; for 1751, on the form of bodies, most proper to turn about themselves, when they are pushed by one of their extremities, or any other point; on the moon's parallaxes, with the diminution of the changes, caused in the parallaxes by the figure of the earth; observation of the lunar eclipse, Dec. 2d, 1751; for 1752, on the operations made by Cassini, called "Corrections;" for 1753, observations on the passage of mercury over the sun, May 6th, 1752; on the dilations of the air in the atmosphere; new treatise on navigation, containing the theory and practice of pilotage, or working of ships; for 1754, operations, etc., for distinguishing, among the different determinations of the degree of the meridian near Paris, that which ought to be preferred; on the direction which the string of a plummet takes; solution of the chief problems in the working of ships; for 1755, on the apparent magnitude of objects; second memoir on the chief problems in the working of ships; for 1757, account of the treatise on the working of ships; on the means of measuring the light. In the volumes of the prizes, given by the academy, are the following pieces by Bouguer; in vol. i. on the working of ships; in vol. ii. on the method of exactly observing at sea, the height of the stars, and the variation of the compass; also on the cause of the inclination of the planets' orbits. M. Bouguer was also for 3 years a writer in the Journal des Savans, to which he communicated several useful papers.

In his earlier years, M. Bouguer had lived in a state of seclusion from general intercourse with the world, and he had thus acquired a caly of temper, which marked his character in more advanced life. Although he was universally acknowledged to possess superior talents, and to be distinguished by an affability and zeal, no less successful than indefatigable, in various departments of useful science; he indulged a degree of suspicion and jealousy, with regard to his reputation, which differentiated some of those with whom he was under a necessity of associating, and which disquieted his own mind. Fully sensible of the importance and utility of his own performances, he was apt to consider others, who were engaged in similar pursuits, as competitors with himself, and to gudge them the reputation which they justly acquired, from an apprehension that his own credit would be thus diminished. Hence arose his disputes with La Condamine, one of the companions of his voyage, and associate in his labours in America; and the mortification he experienced from the public suffrage that seemed to have been belittled on that academicians. It is much to be lamented, that mean jealousies of this kind should fill among perfons, distinguished by their literature and science; because they are not only discrepant to themselves, but injurious to the advancement of useful knowledge. M. Bouguer, after a course of incessant application, which undermined his health, cloathed his life on the 15th of August, 1753, at the age of 60 years. Mem. of the French Academy, 1758. Nouv. Dic. Hist. Montuval, "Histoire des Mathematiques," by De La Lande, tom. iv. Gen. Biog. BOUHIER, John, a penman of eminent literary character, was born at Dijon, in 1673; and first educated at a jetté fermé, where his extraordinary talents for languages were carefully cultivated. The peculiar studies of his profession were prosecuted at Paris and Orleans, whence he returned to Dijon, and began the excercice of it in 1673. Here he distinguished himself by his professional practice, and was admitted into the parliament, succeeding his father in the office of president à mortier. As he devoted his leisure
BOU

Leisure hours to literary inquiries, he was well known to the learned, and in 1727, was unanimously elected a member of the French academy. But afflicted with the gout, he was under the necessity of resigning his office of president à mortier; and, in 1746, this disorder, seizing his stomach, terminated his life. He was much respected on account both of his private and public character; and his literary performances, published separately and in the memoirs of different societies, are very numerous. Some of the principal are, "A translation, in verse, of Petronius on the civil war, and of some passages in Virgil and Ovid." with very learned notes; "A translation of Cicer's Tuculian Questions," in connection with the abbé d'Olivet; the 2d and 3d are by Bouhier; and he also annexed learned notes and corrections to the translations of other Cicer's works; "Letters on the effects of Therapeutics," and "Difficulties on Heroeotus." In his own profession his principal work is "The custom of Burgundy," 2 vols. fol. 1746; and a "Tractate on dissolution of marriage on occasion of impotence," extolled by the curious. Nouv. Dict. Hist. Gen. Biog.

BOUHOURS, DOMINIC, a learned Jesuit and critic in the French language, was born at Paris in 1628; and having taught for some time in the colleges of the Jesuits, became preceptor to the young prince of Longueville, and to the marquis de Seignelay, son of the famous Colbert. He died in the place of his nativity, in 1752. His first work, which was an agreeable milleflony on subjects of taste, entitled "Les entretiens d'Arlette et d'Eugene," appeared in 1671, and was at first much read. His other principal works are, "Remarques et doutes fur la langue Françoise," 3 vols. 12mo.; "Manieres de bien penser pour les voyages," 12mo. much commended by Voltaire; "Pensées ingenieuses des anciens et des modernes," 12mo.; 3 vols. "Live of the grand-mastery of Aubusson, of St. Ignatius, of St. Francis Xavier, by mad. de Bellefond, and translations of some books of devotion, in some of which he manifests his attachment to the Jesuits, though with less credibility than that of others. His manners were polite; but his criticisms, though he was a general apologist, involved him in some literary disputes. Nouv. Dict. Hist.

BOULICERVS, of French authors, in Zoology, their Biskul and antilope l Bulletin. of Linnaeus.

BOVINAM, in Ancient Geography, Boiano, a town of Italy, in Samnium, situated on the mountains. It was taken several times by the Romans; became a Roman colony, and possesscd the advantages granted by the Julian law. See Bojano.

BOUJEAYH, in Geography. See Bugia.

BOULLAC, a town of France, in the department of the Upper Garonne; 3 leagues N. W. of Grenade.

BOULLAC, in Ancient Geography, Marinu, a town of Italy in Latium, situated at the 16th mile in the Appian way, and built after the destruction of Alba, by the Albans. It became a considerable place, as is indicated by its ruins, among which is a temple dedicated to Augustus. Near this city Claudius was slain by order of Milo; and here they celebrated games in honour of the Julian family.

BOULLE, J. A. in Geography, a town of France, in the department of the Lower Seine; 2 leagues S. W. of Rouen.

BOULLEN Menard, a town of France, in the department of the Maine and Loire, and chief place of a canton, in the district of Segrez; 2 leagues N. W. of Segrez.

BOULLEROT, or Bouilierot, in Ichology, common names of several fishes in France, but more especially of Gobius niger; the Cyprinus goiis and Blennius pholis bear the same name.

BOILLET, John, in Biography, born at Servian, in the diocese of Beziers, the 14th of May 1690, and created doctor in medicine, at Montpellier, in 1717, enjoyed, during the course of a long life, spent in the study and practice of medicine, at Beziers, a considerable portion of reputation. He was, in succession, made professor in mathematics; and secretary to the academy at Beziers; member of the royal society at Montpellier, and corresponding member of the academy of sciences at Paris. He was also author of several ingenious dissertations. "On the properties of Rhubarb," published at Beziers 1715, 4to, probably his "Inaugural Thesis." "Sur la cause de la peste africaine," 1729, 8vo., which obtained for him a prize from the academy at Bourdeaux; "Avis et remedes, contre la peste," Beziers, 1731, Svo. "On althium and the gout," in which he commends the preference of the Venice soap as a powerful auxiliary; "Sur la maniere de traiter la petite verole," Beziers, 1736, 4to., and some years after, "On the best method of preparing the district of Beziers from that disease;" "Recueil des lettres, et autres pieces pour servir a l'histoire de l'academie de Beziers," 1756, 4to., with several other publications; for the titles, see Eloy Dict. Hist. He died in 1770.

BOULLET, HENRY NICHOLAS, his son, was born December 6th, 1729. Treading in the steps of his father, he was made doctor in medicine, at Montpellier, and member of the academy of Beziers. He published, in 1753, 4to., "Observations sur l'anaphore, le hydropoése de poutarme, des piccardes," &c. Halleer. Bib. Botan.

BOULLEUR DE CANARI, in Ornithology, the principal name by which the Amar bird is known among the creoles and negroes in Guiana.

BOULLON, among Forriers, a lump of excrement of flesh, growing either on or just by a bovine's flesh, and making him halt.

BOULLON, in Geography, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Sedan; the place contains 1,878, and the canton 4,314 inhabitants. The territory comprehends 167 square kilometres, and 17 communes.

BOULLY, a town of France, in the department of the Aube, and chief place of a canton, in the district of Troyes; 7 miles S. of Troyes. The place contains 750, and the canton 9,310 inhabitants. Within the territory are 252 square kilometres, and 29 communtes.

BOVIN, or Bovving ifan, an island of France on the coast of Lower Poitou, south of the river Loire. It is wholly covered with salt pans.

BOVINA, Affectio. See Affectio.

BOVINA, in Zoology, a species of Tania, found in the viceroy and liver of cattle. This kind is simple, with the vehicle large; body short, with imbricated scales. Barthol. Hist. Anim. Cent. Corea, &c.

BOVINO, in Geography, a city of Naples, in the province of Capitanata, and seat of a bishop, suffragan of Benevento. It stands very high, on the south side of the river Ceravo. It is a duchy belonging to the Gueraus, one of the Spanish families that followed the fortunes of Alphonse the magnanimous.

BOVIS, in Entomology, a species of Phylldrus, with which cattle are infested. Linnaeus distinguishes it by the eight transverse ferruginous lines on the abdomen. Linn. Fl. Succ.

BOVIS, a species of Oestrus, with brown, unsotted wings; abdomen black, white at the base, and at the tip fulvous. Fabr. &c. See Bottle, Gan. fly, and Oest-

BOUSSE, in Geography, a town of France, in the department
part of the Aude, and chief place of a canton, in the district of la Graffe; 3 leagues S. W. of la Graffe.

**BOVISTA.** In Botany. See Lycoperdon.

**BOVITUM,** in Ancient Geography, a place in the second route of Antonine's itinerary, placed by some antiquaries at Bangor-Monachorum; by others at Bovery, and by Mr. Harliff somewhere near Stratton, at the distance of about 10 miles from Chester. But its true situation is unknown.

**BOVIUS,** Thomas, in Biography, an emiracy of a noble family in Italy, lived in the middle and at the end of the 16th century. He called himself Zephrileme, the same he gave to a tutular spirit, who, he pretended, watched over and affixed him. He was well stored with general learning, but applied particularly to the study of the law, of medicine, and of chymistry. He wrote against the regular physicians, and boasts of the success of his practice. He contrived an elaborate and concentrated preparation of mercury and gold, first dissolved in a kind of aqua regia, which he called his Hercules. With this he professed to cure malignant and pestilential fevers, the plague, and the lues venera. He condemned the method used in making the decoction of the woods, by which their volatile parts, in which he contends their virtue reside, were diaphraged. He cured epilepsies with a preparation of antimony, and superseded menyes with helbicolor.

He expelled a tape worm from one of his patients; measuring, he lays, fifty yards in length. He condemns bleeding, except in certain aspects of the heavens. He prepared "aurum potabile," with which he pretended to have performed great cures. He laughs at Capivaccius, who had dismission a patient as incurable, whom he afterwards restored to health. He was addicted to alchemy, and acknowledges he was indebted for much of his knowledge to Arnold de Villanov. He pretends to have cured upwards of 7,000 patients. But notwithstanding his boasting, Claudius Gelchis, who undertook to refute him, in a small tract, since joined to Bovius's works, shows he was no physician, and that he was very little confused. The titles of his works are, "Flagello contro de medici communi detti rationali," 4to. Venc. 1583; "Fulmine contro de medici putatiti rationali," 4to. Verona, 1592; "Melampygo, o vero confusione de medici solittii e del Claudia Gelli," Verona, 1595, 4to. He discovered that a disease, affecting the inmates of a monastery, was occasioned by their cooking their food in copper vessels, not well tinned. His works, which separately passed through several editions, were collected and printed at Venice, in 1626, 12mo. Haller. Bib. Med. Pratica.

**BOUKA,** in Geography, an island of the Pacific ocean, so called by Bougainville, from the frequent use of this term among the natives, separated by a narrow channel from Bougainville island. It is sometimes called lord Anson's island. The vast plantations of cocoa-nut trees which adorn its shores, indicate a numerous population. The natives are dextrous in the use of their canoes: they seem to be acquainted with the method of barter; and from the value which they affix to nails and other articles of hard-ware, they indicate a knowledge of the use of iron. They are addicted to gaiety, and passionately fond of mufic, especially of the most brisk and noisy tunes. The colour of their skin is blackish; they are of a middling stature; and their mufcles distinctly seen as they are naked, indicate great strength. Their figure, though not very agreeable, is very expressive. Their heads are very large; their foreheads broad, like the other parts of their faces, which are very flat; their chins large and prominent, their cheeks full, their noses flat, their mouths very wide, and their lips thin; their ears are loaded with large rings made of shell, by which they are very much extended. Some have red and white streaks traced upon their bodies; and some have bracelets formed of the fibres of the coocnut husk. Their hair is curled, thick, and bulky; and they pluck the hair from every other part of the body. They handle the bow with much address; and their industry seems to be particularly directed to the fabrication of their arms. Their canoes are formed of several planks, ingeniously contructed, and adapted for a quick motion. The north point of Bouka is in S. lat. 5° 41'; and 154° 28' E. long. Labillardiere's Voyage in search of La Péruse, vol. i. p. 375, &c.

**BOULAC,** Boulaq, or Bulaq, a large, irregular, and pleasant town, about 2 miles long, but not very wide, built on the east side of the harbour of Grand Cairo, and about half a league distant from it. The road leading to it appears to be one of its streets; and the crowd and bustle of the place indicate the entrance of a populous and commercial city. Boulaq is the port of Lower Egypt, as well as of Cairo, as Mir-el-Attie is of Upper Egypt; and here all the merchandize is landed which comes from Damietta and Alexandria. It contains magnificent public baths, and large "Okals," which are square buildings, round a great court with a portico, that supports a winding gallery. The ground floor is composed of spacious warehouses; and the next floor contains apartments without furniture and without ornament. These okals are inhabited by strangers, who there deposit their merchandize. One single gate, like that of the citadel, secures them from insult at the time of the revolts. These okals are the only inns to be met with in Egypt. The traveler is obliged to furnish them, and dres their victualls there; for in this country a dinner is not to be had for money. The okal built by Ali Bey the great, and called the Alexandrian okal, is equally extensive and convenient, and chiefly used for goods brought from that city. From all the houses at Bulaq thousands of boats may be seen at anchor, of every shape and of every size. Some of them are strong and solid, and have two masts, and are employed in transporting merchandize. These have usually a large chamber for the passengers. Others, lighter and without deck, only serve to convey the people from one shore to the other. Those which are used in voyages of pleasure are adorned with painting and sculpture, and have handsome apartments covered with carpeting, and sheltered from the sun. In these the rich amuse themselves by breathing that cool air, which is incessantly supplied by the Nile. With a favourable wind, and when the hail is spread, these light vessels seem to fly upon the water; but when the wind is contrary, a number of robust men row them with great rapidity. Cleopatra, who knew the charms of these water-parties, and the variety of landscapes which diversify the verdant banks of the Nile, engaged Caesar in one of them, and carried him even into Upper Egypt. Gardens occupying the fertile grounds between the branches of Bulaq, and between this port and Cairo, afford an ample supply of fruits and vegetables. In the middle of the river, nearly over against Bulaq, is an island, where Murad Bey has a kind of prospect house, or place of retirement, and here are also several gardens. Opposite Bulaq, upon the west bank of the Nile, is the small village of "Emabah," or "Emhabil," composed of wretched round huts of earth under the yacamo trees, by which they are propped. Some few houses of brick hardened in the sun, and a small mosque, loke themselves at a distance, among the foliage of date and tamarind trees. This village is famous for the excellent quality of its butter, with which it supplies the inhabitants of Cairo; and, indeed, it is the only place in Egypt where butter can be eaten fresh; every where else, in that country,
it is good for nothing. The fertile plains adjacent to Embab, on the westem side, are enriched with several kinds of culture; and in particular they produce a fort of lupins, of the seeds of which there is a great consumption in Egypt. These are boiled with salt and water, and eaten, after being stripped of the thick and hard skin with which they are covered. They are sold ready dressed in the streets and markets. By the Christians in the cafè, lupins, called "Embabens," from the place of their growth, are eaten as a stimulus for drinking barley. Flour is also made of them, which is adapted to clean the hands and soften the skin. The flakes, reduced to flour, is preferred to other charcoal in the composition of gun-powder.

Half a league to the north-call of Boulac is the old castle of "Helle;" so called, probably, from "Heliopolis," not far distant; it is now falling into ruins. Here the Beys, attended with brilliant retinues, receive the new pacha, to conduct him in pomp to the prison, whence they have just expelled his predecessor. In the environs of Helles are spacious inclosures, where orange, lemon, and pomegranate trees grow luxuriantly, and form, with fycamores and palms, bowers and groves of delicious fragrance and refreshing coolness. Savary, Sonnini, Brown.

BOULAI, CAESAR-LASSE DE, in Geography, regifter, historiographer, and rector of the university of Paris, was a native of St. Etienne, in Maine, and became, for many years, professor of rhetoric in the college of Navarre. His treatise of rhetoric entitled "Speculum eloquentiae," was much esteemed; and he also published, in French, a "Thesaurus of Roman antiquities," fol. Paris, 1639; but he acquired his highest reputation from a "History of the university of Paris," in 6 vols. fol. containing, indeed, many fabulous relations with regard to the early periods of the university, but much curious information concerning the lives and writings of the literati of France, and of other countries. Boulay wrote Latin verses with tolerable ease and purity. He died in 1678. Gen. Dict.

BOULAINVILLIERS, HENRY DE, count de St. Saire, &c. was born at St. Saire, in 1658, and educated in a seminary of the fathers of the oratory. His first profession was that of arms, which he quitted on the death of his father, and an account of the deposed state of his domestic affairs. From this time he ardently pursued his favourite studies of history and genealogy, both for his own amusement, and the instruction of his children. Voltaire, qualifying his commendation by ascribing to him that attachment to fyltem, which perverted his narrations, says of him, that he was the most learned gentleman in the kingdom, with respect to history, and the best qualified to write that of France. But Montesquieu, as well as the president Hénault, have entirely rejected his assertions concerning the commencement of the French monarchy; and the former characterizes him as "polleing more wit than understanding, and more understanding than knowledge." Such was his respect for nobility, that he entitled the feudal system, "the matter-piece of human art." Inclined as he was, in some respects, to freethinking, he had his systematic prejudices, and avowed his faith in judicial astrology. In all his writings, however, his intentions seem to have been those of a good citizen. His works are, "A History of France, to the reign of Charles VIII," 3 vols. 12mo; "Hitorical Memoirs on the ancient government of France, to the time of Hugh Capet;" "History of the Peage of France;" "Differtations on the Nobility of France;" "State of France," 6 vols. 12mo; "Memoir on the Administration of the Finances." 2 vols. 12mo; "History of the Arabs and of Mahomet," left unfinished, but published after his death, both at London and Amsterdam; in which work, it seems to have been his aim to represent Mahomet as a hero, and an accomplished statesman; but in doing this, he has deviated much from true history. This work subjected him to the suspicion of indifference with regard to Christianity but the Catholics have endeavoured to adduce attestations to his piety, at the time of his death, which happened in 1722. All his works on French history have been collected in 3 vols. folio. Nouv. Dict. Hist.

BOULAN, in Geography. See BULAM.

BOULANCHIR, a town of Aftatic Turkey, in the province of Adahulia, 20 miles S. W. of Malatia.

BOULANGER, NICOLAS-ANTHONY, in Biography, was born at Paris, in 1721, and devoting himself to the study of mathematics and architecture, he accompanied the baron de Thiers to the army, as engineer. On his return, he was employed in the construction of bridges and caissons, and executed various public works in Champaigne, Burgundy, and Lorraine. From contemplating, in the exercise of his profession, the changes which have taken place in the surace of the earth, he was led to extend his views and researches to the changes of manners, government, and religion; and, in order to acquaint himself more accurately and extensively with these subjects, he applied to the revival, or improvement, of his knowledge of Greek and Latin, and to the study of the oriental languages, both ancient and modern; and if his life had been prolonged, he would have become one of the most learned men in Europe. His speculations, however, inclined him to freethinking; and of this he gave evidence in various publications. Such were, "A Treatise on Oriental Delphins," "Antiquity Unveiled," published after his death; "Christianity Unveiled," not ascertained to have been written by him; "A Differtation on Elyas and Enoch." He also contributed to the Encyclopaedia the articles "Deluge," "Corree," and "Society." He died in 1759. Nouv. Dict. Hist.

BOULANGER, JOHN, an engraver, who flourished about the year 1657, was a native of France. His first manner of engraving was partly copied from that of Francis de Poilly; but he afterwards adopted a manner of his own, which, though not original, he greatly improved; and, accordingly, he finished the faces, hands, and all the naked parts of his figures very neatly with dots, instead of strokes, or strokes and dots. This style of engraving has been of late carried to a high degree of perfection, particularly in England. Notwithstanding several defects in the naked parts of his figures, and in his draperies, his belt prints are deservedly much esteemed. Such are "A Holy Family," from Fran. Corlet; "Virgin and Child," from Simon Vouet; "The Pompos Cavalcade," upon Louis the XIV. coming of age, from Chauveau; "The Virgin with the infant Christ," holding home pinks, and therefore called "The Virgin of the Pinks," from Raphael; "The Virgin of Paffau," from Salario; "Christ carrying his Croze," from Nicolas Mignard; "A dead Christ, supported by Joseph of Arimathesus." He also engraved many portraits, and, among others, that of Charles II. of England. He likewise engraved from Leonardo de Vinci, Guido, Champaigne, Stella, Coypel, and other great masters, as well as from his own designs. Strutt.

BOULAR, in Ornithology. Cotgrave has the long-tailed titmouse, parus castatus, under this name.

BOULAY, in Geography, a town of France, in the department of the Molsfick, and chief place of a canton, in the district of Metz; 43 leagues N. E. from Metz. The place contains 2,609, and the canton 12,813 inhabitants: its territorial extent comprehends 275 square kilomelres, and 37 communes.
BOU

BOULACCA, among the modern Greeks, denotes the spirit of some wicked person who died excommunicated by the patriarch, re-animated by the devil, and causing great disturbances among the people: of which many strange stories are told. The word is Greek, and is sometimes written ψευδακτης, ψευδακτορ; and supposed to be derived from ψευδής, or ψευδώ, ψευδών; and λαός, a district, on account of the wildness of the fight.

BOULDER wall, a building, a kind of walls, built of round flints or pebbles, hid in a strong mortar; used where the sea has a beach call up, or where there is plenty of flints.

BOULUC, Simon, in Biography, an eminent apostate and chemist of Paris, and for many years demonstrator in Chemistry, and associate in the Royal Academy of Sciences, furnished the memoirs of that society with numerous dissertations, containing analyses of the most popular and valuable vegetable productions used in medicine, which are still valued for their neatness and accuracy. The principal are, the analysis of ipecacuanha and of colocynth, published in the memoirs of the academy for the year 1701; of jahal, helbore, and fociotrine aroses, in 1708; of catechu, (terra japonica) 1710; shewing this substance to be a vegetable production, and not an earth, as it had been esteemed; of rubarb and opium, published in 1712; of the cucumis agrilis, in 1719. He made an extract from the wild cucumber, which was a powerful hydragogue, and which might be given in doses of 24 grains, with perfect safety; also an elixirium, the dose of which was fix grains. He died, far advanced in years, in 1729. His son.

BOULUC, Giles Francis, born at Paris, February 28th, 1675, succeeded to his honours and appointments, and continued the same line of rearch. His effays, containing analyses of several purging fluxes, and of some mineral waters, were also published in the memoirs of the Royal Academy of Sciences. He died at Verailles, the 17th of January, 1742, much regretted by the king and queen, to whom he had been many years apothecary. Haller Bib. Bot. Eloy Dict. Hist.

BOULEAU Lake, in Geography, a lake of North America, in the vicinity of Bear Lake, with which it communicates by rivers and small lakes. This lake might, with greater propriety, be called a canal, as it is not more than a mile in breadth. Its course is rather to the east of north for 33 miles, to Portage de L'Ile. The Bouleau Portage is in N. lat. 45° 50'.

BOULENE, a town of France, in the department of the Gard, five miles E. of Pont St. Epirit.

BOULETERANES, a town of France, in the department of the Eastern Pyrenees; 12 miles W. of Perpignan.

BOULEY BAY, called also Trinity Bay, lies on the N. E. point of the island of Jersey, and E. from Donnington.

BOULMY, in Medicine. See BULBY.

BOULINIS, or BOULIGNIS, in Commerce, a copper coin struck at Bologna, in Italy, equivalent to the IACOCO.

BOULKI, in Geography, a town of Poland, in the pala
tinate of Lemberg; 16 miles S. E. of Lemberg.

BOULORE, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of St. Calais: the place contains 1400 and the canton 9,411 inhabitants: its territory includes 160 kilometres, and nine communes: five leagues E. of Le Mans.

BOULONGNE, LOUIS DE, the elder, in Biography, a painter, was born at Paris in 1609; and though he was principally distinguished for his ability in copying the works of the most famous ancient painters, and in preserving a very striking resemblance, he painted historical subjects of his own invention and design; of these there are three in the church of Notre Dame, in Paris, viz. "St. Paul at Ephesus," "the Martyrdom of St. Paul," and "the Prefentation of Christ in the Temple." He was painter to the king, and professor in the academy. He died at Paris in 1674.

BOULONGNE, BON DE, son of the former, was born at Paris, in 1649, and acquired the principles of painting from his father, whom he rendered in his talent of imitating the works of the greatest masters, and this he did to such a degree as to deceive the best judges. On his return from Italy, where he continued five years, he was admitted into the academy, of which he became a professor, and employed by Louis XIV. at Versailles and Trianon. He excelled in history and portrait; his designs were accurate, and his colouring good. Indulgent in his profession, though lively in his temper; he promoted industry among his pupils, in whose improvement and success he warmly interested himself. Besides his paintings in fresco, in two of the chapels of the Invalids, he painted several pieces for the churches and public buildings of Paris, several of which have been engraved. We have also three etchings done by him, from his own compositions, viz. a species of "Almanack," "St. John in the Desert," and "St. Bruno in a landscape," its companion. He died at Paris in 1717.

BOULONGNE, LOUIS DE, the younger, brother of the former, was born at Paris, in 1654, and educated under his father, by whose instruction he made such improvement, that he obtained the prize of the academy at 18. His studies were completed at Rome, where he particularly stu-
died the works of Raphael, and from his copies which were sent home, the Gobelins tapestries were executed. After his return he was received into the academy in 1680; and his works in the churches of Notre Dame and the Invalids, and particularly his frescos in the chapel of St. Augustin, were so much esteemed, that Louis XIV. honoured him with his special patronage; allowing him a considerable pen-
sion; conferring upon him the order of St. Michael; choos-
ing him designer of medals to the Academy of Inscriptions, after the death of Anthony Cupel; appointing him his principal painter, and embooling him and all his descendants: The Academy of Painting also chose him for its rector, and afterwards director, which place he occupied till his death. He chiefly excelled in historical and allegorical sub-
jects. From his performances it appeared, that he had care-
fully studied the most eminent masters; his colouring was strong, his composition was in a good style, the airs of his heads had expression and character, and his figures were cor-
rectly designed. Two of his historical paintings in the church of Notre Dame, are particularly distinguished, viz. "Christ and the centurion," and the "Good Samaritan." His etch-
ings, of which there are a few, are spirited and free, but incorrectly drawn. Among these are the "Scourging of St. Andrew," from Paolo Veronese; the "Martyrdom of St. Peter," and the "Martyrdom of St. Paul," his companion, from his own composition. His regular attendance at the academy, and his advice to the students, commanded respect; and the general mildness and affability of his dispo-
sition engaged esteem among those who knew him. He raised a considerable fortune by his profession, and died in 1734. Two sisters of this family, "Genevieve," and "Mag-
dalen," painted well, and were members of the Royal Aca-

BOULONNIS, in Geography, a country of France, so called before the revolution, in the northern part of Picardy, of which the capital was Boulogne.

BOU
BOULOGNE, or Boulogne-sur-Mer, a city and sea-port of France, lying in a bay of the same name, in the English channel, and chief place of a district, in the department of the Straits of Calais. The city is computed to contain 19,538, and the canton 16,199 inhabitants; the territory comprehends 70 kilometres and 8 communes. Boulogne is divided into the upper and the lower town; the upper, and smaller, is seated on the declivity of the chalk mountain, and surrounded with walls; the lower town lies nearer to the sea, has no walls, is larger, and contains a greater number of inhabitants than the other. By its connection with the harbour, formed by the river Laine, it monopolizes almost the whole of the trade. Before the revolution it was the seat of a bishop, suffragan of Rheims, the seat of a governor, a commandant, a king’s lieutenant, &c. The entrance into the harbour is difficult, and defended by a small fort; but ships of war can proceeds no farther than the road of St. John, and trading ships can only enter it with the tide. In the road there is good anchorage, sheltered from easterly winds, in five to fifteen fathoms, and a clean hard sand; 1 4th to the northward of the village it is foul and ftony ground; and there are some small rocks along the coast, so that ships must not approach too near the southward of the road. The English channel, from about Romney to the bottom of the bay of Boulogne, is about 30 miles wide; and this short distance was formerly favourable to the smugglers of English wool. Boulogne is the "Getaeicum" of the ancients, and it was denominated "Bononia" under the Latins. The famous Pharos, or light-house, at this place, was erected of an octagonal form, about 200 feet in circumference, and 66 feet in diameter, by Caligula, and it was repaired by Charlemagne in 810. In 1743, when the English took this city, they surrounded the ancient structure with towers; and it was thus preferred till the 29th of July 1443, when the whole of it fell, and nothing now remains but rubbish. Mr. Lyon, in his "Observations on the ancient Portus licius," where Julius Cæsar embarked for Great Britain, contends (see Archæologia, vol. v.), that this could not have been Calais, nor any place to the eastward of it, but that it went to the westward, and at Boulogne. From a piece or two, which he procured, of the materials of the ancient structure above mentioned, he infers that the pharos was constructed at Boulogne of a petrification called by the ancients tophus, and that it is of the same kind with that used in the construction of the other light-house, built by the Romans on the hill at Dover, which still exists, though gradually sinking into decay. N. lat. 50° 43′ 33″. E. long. 1° 36′ 33″. "High-water 13° 30′.

BOULOGNE, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of St. Gaudens; 4 leagues N. of St. Gaudens. The place contains 1,476, and the canton 10,622 inhabitants; the territory comprehends 2473 kilometres, and 25 communes.

BOULTON, J. F., a town of France, in the department of the Eastern Pyrenees, taken by the Spaniards in 1793; and re-taken in 1794; 4 leagues south of Perpignan.

BOULTER, Hugh, in Biography, a prelate eminently distinguished by his charity and public spirit, was born in or near London, in 1671, and from Merchant-Payler’s school removed to Christ-church college in Oxford, whence he was elected, together with Addington, a demy of Magdalen college, of which he afterwards became fellow. By the influence of lord Sunderland, he obtained his first ecclesiastical promotion to the parsonage of St. Olave in Southwark, and the archdeaconry of Surrey. In this situation he remained, addidiously discharging his pastoral duties, for several years;

but in consequence of having ingratiated himself with king George I., when he accompanied him to Hanover, in 1719, as his chaplain, he obtained, by royal favour, in that year, the bishopric of Bristol, and deanery of Christ-church, vacated by the death of Dr. Smalridge. In 1724, he was urged by the king’s absolute commands to accept the archbishopric of Armagh, and primacy of Ireland; in which trying station he manifested that wisdom and firmness, which were peculiarly fitted to the distracted condition of the country. Intent upon promoting the true interests of that country, he pursued every measure which prudence or benevolence could suggest for this purpose. In 1728, and again in 1740, he diverted the horrors of famine, and liberally supplied the necessities of the poor from his own fortune. He also exerted himself in teaching and converting the poor natives, and, with this view, in promoting the establishment of the protestant charity-schools. His popularity, indeed, for some time declined, in consequence of a plan, which ultimately proved beneficial, for remedying the scarcity of silver, by diminishing the value of gold coin; but it was not long before he regained the public favour, in a manner that he left behind him a character highly respected and beloved. Nevertheless, he always inclined to the English interest, in opposition to the Irish, and recommended to the English government a steady adherence to it in all their favours and promotions. As Dr. Swift was attached to the contrary interest, he thought unfavourably of him, and preferred him to the minifters in England, as a dangerous and mischievous person. However, through the opinions of these great men were discordant, they both probably aimed at the same object, or the good of Ireland. The prime was on no occasion actuated by a party-spirit, but wished by the aid of any connections to do all the good in his power. His whole life was devoted to business; and when he was, for the 13th time, one of the lord’s justices of Ireland, he had occasion to visit England, and died there in 1742. He was interred in Westminster abbey, and a splendid monument has been erected to his memory. A collection of his letters to ministers of state, and others, was published at Oxford in 1709, in 2 vols. 8vo, containing much information with regard to Irish politics during his primacy. Biog. Brit.

BOUTINE, or Boltel, in Architecture, the workman’s term for a convex moulding, whose periphery is just 4 of a circle placed next below the plinth, in the Tunic and Doric capitals.

BOULTON, Richard, in Biography, a practitioner in medicine and surgery, of the city of Cheltenham, published "A Treatise on the Causes of muscular Motion," 1697, 12m. He attributes the action of the muscles to a sort of fermentation, arising from the commixture of the blood and the nervous fluid, in certain glands, which he supposed to exist in the fibrous part of the muscles; a doctrine nearly similar to that held by Borelli. "A System of rational and practical surgery," 1715, 8vo. This is taken principally from the works of Woffington, of which it is little more than an abridgment. "A Phystico-mechanical Account of the Gout, King’s Evil, &c." 1715, 8vo. London; and an "Effuy on external remedies," published about the same time. Hall. Bib. Med. et Chir.

BOULUE, in the Military Orders of the Turks, a body of the janizaries, with an officer in the place of a colonel at their head, sent upon some particular enterprise; they are selected out of the body for this, and, for this reason, are received again into their former companies.

BOUNCE, in Idiography, a name given by the people of the western parts of England, to a species of the mark.
BOU

tribe; the _faunulus cantica_ of Linnaeus; _centuria major vulgaris_ of Ray and Willughby; _greater dogfish_ of English writers. See _Canula_.

BOUND, in _Dancing_, a spring from one foot to the other, by which it differs from a hop, where the spring is from one foot to the same. It also differs from a half couplet, as, in the latter, the body always bears on the floor, either on one foot or the other; whereas, in the bound it is thrown quite from the floor.

Bound, hoof. See Hoof-bound.

Bound-falffs. See Ballife.

Bounties of an Eclipse. See Eclipse.

Bounds of lands. See Abutials.

BOUNDARY Columns. See Column.

BOUNTY, in _Commerce_, denotes a premium paid by the government to the exporters of certain commodities, on their taking oath, or, in some cases, giving bond, not to re-land the same in England.

Bounties, as they respect the fisheries, are either _perpetual_ or _temporary_. The former are payable on the export of pilchards, or shads, cod-fish, ling, or hake, whether wet or dried, salmon, white herrings, red herrings, and dried red sprats, being of British fishery and curing. _Stats. c._ 18. § 6. 26 Geo. III. c. 81. § 16. The latter are payable on the tonnage of ships carrying on the British and Greenland fisheries; on the quantity of fish taken in the British and Newfoundland fisheries; on the quantity of oil, head-matter, blubber, and whale-fins, taken in the Southern whale-fishery, and on the export of pilchards. See Fishery, and Navigation _Ad._ The bounty on cordage manufactured in Great Britain, not less than three tons, is 3s. 4d. per cwt. 6 Geo. III. c. 45. 26 Geo. III. c. 85. 51 Geo. III. c. 63.

Bounties have been granted by several statutes on the exportation of corn, when it does not exceed stipulated prices at the port of exportation.

Bounties upon exportation, considered in a more general view of them, are, in Great Britain, frequently petitioned for, and sometimes granted to the produce of particular branches of industry. By means of these our merchants and manufacturers are supposed to be able to sell their goods as cheap or cheaper than their rivals in the foreign market; and a greater quantity, it is said, will thus be exported, and the balance of trade consequently turned more in favour of our own country. They serve, as those who favour them maintain, the purpose of a kind of premium, inducing foreigners to buy our goods, and in this manner to enrich the whole country, and put money into all our pockets by means of the balance of trade. Bounties, it is allowed, says Dr. Smith (Inquiry into the Nature and Causes of the Wealth of Nations, vol. II. p. 261, 18c. ed. 6.), ought to be given to those branches of trade only, which cannot be carried on without them. But every branch of trade, in which the merchant can sell his goods for a price which repays him, with the ordinary profits of stock, the whole capital employed in preparing and sending them to market, can be carried on without a bounty. Those trades only require bounties, in which the merchant is obliged to sell his goods for less than it really costs him to send them to market; and the bounty is given in order to compensate this loss, and to encourage him to continue, or perhaps to commence, a trade, of which the expense is supposed to be greater than the returns, so that every operation consumes a part of the capital employed in it.

An ingenious author, in his " _Tracts upon the Corn-

Trade," has clearly shewn, that since the bounty upon the exportation of corn was first established, the price of the corn exported, valued moderately enough, has exceeded that of the corn imported, valued very high, by a much greater sum than the amount of the whole bounties which have been paid during that period. Hence he infers, that upon the true principles of the mercantile system, this forced commerce is beneficial to the nation; the value of the exportation exceeding that of the importation by a much greater sum than the whole extraordinary expense which has been incurred by the public in its exportation. But Dr. Smith argues, that this extraordinary expense, or the bounty, is the smallest part of the expense which the exportation of corn really costs the society. The capital employed by the farmer should also be taken into the account; and unless the price of the corn, when sold in the foreign markets, replaces, not only the bounty, but this capital, together with the ordinary profits of stock, the society is a loser by the difference, or the national flock is so much diminished.

But the very reason for which it has been thought necessary to grant a bounty, is the supposed insufficiency of the price to do this. It has been said, that the average price of corn has fallen considerably since the establishment of the bounty. But, allowing this to be the case, it must have happened, says Dr. Smith, in spite of the bounty, and cannot possibly have happened in consequence of it; and he traces this gradual fall in the average price of corn to that gradual and insensible rise in the real value of silver, which he supposes have taken place in the general market of Europe, during the course of the last century. In his opinion it seems to be altogether impossible, that the bounty could ever contribute to lower the price of grain. In years of plenty, the bounty, by occasioning an extraordinary exportation, necessarily keeps up the price of corn in the home market above what it would naturally fall to; and this was the avowed purpose of the institution. In years of scarcity, though the bounty is frequently suspended, yet the great exportation which it occasions in years of plenty must frequently hinder, more or less, the plenty of one year from relieving the scarcity of another. In both, therefore, the bounty necessarily tends to raise the money price of corn somewhat higher than it otherwise would be in the home market. It has been thought, however, by many persons, that the bounty tends to encourage tillage; partly, by opening a more extensive foreign market to the corn of the farmer who produces it, and partly, by securing to him a better price than he could otherwise expect in the actual state of tillage. This double encouragement, it is conceived, must, in a long period of years, occasion such an increase in the production of corn, as may lower its price in the home market, much more than the bounty can raise it, in the actual state of the tillage, whatever it may be, at the end of that period. To this reasoning Dr. Smith replies, that whatever extension of the foreign market can be occasioned by the bounty, must, in every particular year, be altogether at the expense of the home market; as every bushel of corn, which is exported by means of the bounty, and which would not have been exported without it, would have remained in the home market to increase the consumption, and to lower the price of that commodity. The corn bounty, as well as every other bounty upon exportation, imposes upon the people two different taxes; viz: the tax, which they are obliged to contribute towards paying the bounty, and that which arises from the advanced price of the commodity in the home market, and which, as the whole body of the people are purchasers of corn, must, with regard to this particular commodity, be paid by the whole body of the people.
This second tax is by much the heaviest of the two; amounting, for every five shillings per quarter of wheat contributed towards the payment of the first tax, to 6$. towards the payment of the second. This heavy tax, resting upon the first necessity of life, must either reduce the subsistence of the labouring poor, or it must occasion some augmentation in their pecuniary wages, proportionable to that in the pecuniary price of their subsistence. In the one way, it must tend to restrain the population of the country, as it reduces the ability of the labouring poor to bring up their children; and in the other, it must tend to restrain the industry of the country, as it reduces the ability of the employers of the poor to employ so great a number as they otherwise might do, in proportion to the degree of its operation in both respects. "The extraordinary exportation of corn, therefore, occasioned by the bounty, not only in every particular year, diminishes the home, just as much as it extends the foreign market and consumption, but by restraining the population and industry of the country, its final tendency is to limit and restrain the gradual extension of the home market; and thereby, in the long run, rather to diminish, than to augment, the whole market and consumption of corn."

It has been thought, however, that the enhancement of the money price of corn must necessarily encourage its production, by rendering that commodity more profitable to the farmer. To this plea Dr. Smith replies, "that this might be the case if the effect of the bounty was to raise the real price of corn, or to enable the farmer, with an equal quantity of it, to maintain a greater number of labourers in the same manner, whether liberal, moderate, or scanty, than other labourers are commonly maintained in his neighbourhood. But neither the bounty, nor any other human institution, can have any such effect. It is not the real, but the nominal price of corn, which can in any considerable degree be affected by the bounty. And though the tax, which that institution imposes upon the whole body of the people, may be very burdensome to those who pay it, it is of very little advantage to those who receive it. The real effect of the bounty is not so much to raise the real value of corn, as to degrade the real value of silver, or to make an equal quantity of it exchange for a smaller quantity, not only of corn, but of all other home-made commodities; for the money price of corn regulates that of all other home-made commodities." The money price of corn regulates the money price of labour, and of all the other parts of the rude produce of land, which, in every period of improvement, must bear a certain proportion to that of corn, though the proportion in different periods may be different. In this latter way, it also regulates the money price of the materials of almost all manufactures, and that of manufacturing art and industry. Though in consequence of the bounty, the farmer should be enabled to sell his corn at an advanced price, and to pay his landlord a proportionable advanced rent; yet if, in consequence of this rise of the price of corn, the money thus obtained will purchase no more home-made goods of any other kind, than the lower price would have done before, neither the circumstances of the farmer, nor those of the landlord, will be much mended by this change. The farmer will not be able to cultivate much better; the landlord will not be able to live much better. In the purchase of foreign commodities, this enhancement in the price of corn might give them some little advantage; but in that of home-made commodities, which constitute the whole expense of the farmer, and the far greater part even of that of the landlord, it can give them none at all.

The bounty, as it raises in the home market, not so much in the real, as the nominal price of our corn; as it augments, not the quantity of labour which a certain quantity of corn can maintain and employ, but only the quantity of silver which it will exchange for; it discourages our manufactures, without rendering any considerable service to our farmers or country-gentlemen. Although it puts a little more money into the pockets of both, yet if their money links in its value, as to the quantity of labour, provisions, and home-made commodities of all different kinds, which it is capable of purchasing, as much as it rises in its quantity, the benefit accruing from it will be little more than nominal and imaginary. There is, indeed, one class of men, to whom the bounty may be essentially serviceable; and this consists of the corn-merchants, the exporters and importers of corn, who are most anxious for the continuance or renewal of the bounty.

Bounties upon the exportation of any home-made commodity are liable to the general objection, that may be made to all the different expedients of the mercantile system, that is, of forcing some part of the industry of the country into a channel less advantageous than that into which it would run of its own accord, and also to the particular objection of forcing it into one that is actually disadvantageous; the trade, which cannot be carried on otherwise than by means of a bounty, being necessarily a losing trade. The bounty upon the exportation of corn is liable to this farther objection, that it can in no respect promote the raising of that particular commodity, of which it was meant to encourage the production. With a view of encouraging the production of any commodity, a bounty upon production would operate more directly than one upon exportation; and it would have the advantage of imposing only one tax upon the people, or that which they must contribute in order to pay the bounty. Bounties upon production, however, have been very rarely granted. The prejudices established by the commercial system have taught us to believe, that national wealth arises more immediately from exportation than from production; and accordingly, it has been more favoured, as the more immediate means of bringing money into the country. It has been also laid, that bounties upon production have been found more liable to frauds than those upon exportation. The latter, however, have not been altogether exempt from this charge. A bounty upon exportation has sometimes enabled the merchant and manufacturer to send abroad the surplus goods of an overflowed market, and to keep up the price of what remains in the home-market; and, therefore, instances have occurred, in which the undertakers of particular works have privately agreed to give a bounty out of their own pockets upon the exportation of a certain portion of the goods, in which they have dealt; and this expedient has answered the purpose, by doubling the price of their goods in the home market, notwithstanding a very considerable increase in the production.

Something like a bounty upon production, however, has been granted upon some particular occasions. Of this nature are the tonnage-bounties given to the white-herring and whaling fisheries. "These, it may be supposed, have a direct tendency to render the goods cheaper in the home-market than they otherwise would be. In other respects, their effects are the same as those of bounties upon exportation. By means of them a part of the capital of the country is employed in bringing goods to market, of which the price does not repay the cost, together with the ordinary profits of stock. But though the tonnage bounties on the fisheries do not contribute to the opulence of the nation, yet they may be thought to contribute to its defence, by augmenting the number of
the fisheries and shipping. Dr. Smith suggered, however, that
these may sometimes be done by means of such bounties, at a
much smaller expense than by keeping up a great standing
navy (if such an expression may be used), in the same way as
a standing army; and the ingenious author inclines to believe,
that in granting at least one of these bounties, the legislature
has grossly imposed upon. On this subject he makes the
following observations. First, the herring busses bounty is
to large. Secondly, the bounty to the white herring
fishery is a tonnage bounty, and proportioned to the burden
of the ship, not to her diligence or success in the fishery;
whence it has been too common for vessels to fit out for the
sole purpose of catching, not the fish, but the bounty.
Thirdly, the mode of fishing, for which this tonnage bounty
in the white-herring fishery has been given (by busses or
docked vessels from 20 to 80 tons burden), seems not so well
adapted to the situation of Scotland as that of Holland, from
which country it seems to have been borrowed. The bounty
granted to the busses fishery is necessarily a discomagement
to the boat-fishery, which tends better adapted to the peculiar
situation of Scotland, intermixed by arms of the sea running
up a long way into the land, and called sea-lochs, and which,
by the operation of the busses bounty, is gone almost entirely
to decay. Fourthly, in many parts of Scotland, during cer-
tain seasons of the year, herrings supply a great part of the
food of the common people; and, therefore, a bounty, which
kaxed to lower their price in the home market, might contri-
but to very general relief. The herring-busses bounty contributes
to such good purpose. It has raised the boat-fishery which is belt adapted for the supply of the home
market, and the greater part of its produce is sent abroad.
Another ingenious writer, Dr. Anderson (ubi infra), has
pointed out similar defects attending the fisheries of Scotland;
and he proposes, for remedying them, that a reasonable
bounty should be allowed on every barrel of herrings properly
cured; and that the bounty upon busses per ton should be
lowered, and these vessels be prohibited from fishing within a
limited distance of the coast. This would allow the natives
to fish in their creeks with freedom; and it would likewise
allure merchants to come and purlchase the fish when fresh,
cought, and cure them for themselves. But as the most
important improvement, he proposes that the herring and
Greenland whale-fisheries should be made to go hand in hand,
and mutually assist one another. The whale-fishery, he ob-
terves, has been greatly retarded by the large size of the vef-
nels which have been usually employed in it, and the mima-
agement that always attends public companies in matters of
trade. To prevent this, in some degree, for the future,
Dr. Anderson proposes, that the bounty should be granted
to vessels of a smaller size; and that all restrictions, with regard
to the number of hands, provisions, tackle, &e. should be
etirely abolished; in lieu of which the vessels should be only
obliged to pursue the fishing for a certain limited time (if not
sooner loaded), without following any other employment.
These small vessels would be equally proper for the her-
ing-fishery as for that in the Greenland seas; and as in both
fisheries the necessary number of hands is nearly the same, it
would be easy for the adventurers, on their return from the
Greenland seas, to put ashore their loading, with the filhing
apparatus, and take on board the tackle, &e. necessary for the
herring-fishery, and to proceed immediately to the proper
locations in search of that kind of fish. It is further proposed,
that instead of fixing the rendezvous for the herring-fishery
precisely to the 22d of June and 1st of October, as it pre-

tent, ships might be entitled to receive the bounty, if they
began fishing on any day between the two periods above-men-
tioned; the ships being obliged to continue three months
from the time of their entry, or to the end of the fishing
season following, if they have not sooner completed their
landing. By such regulations, the loss of time would be pre-
vented; and adventurers would be induced to fit out small
vessels at a time when trade was dead; and they would con-
duct the business at a lesser expense, and with greater profit,
that large trading companies. See FISHERY.
In particular manufactures that are deemed necessary for
the defence of society, and for the supply of which it would not
always be prudent to depend upon our neighbours, and
that could not otherwise be supported at home, it would not
be unreasonable to tax other branches of industry for their
support. Upon this principle the bounties upon the exporta-
tion of British made-fail, cloth, and British made gun-power,
may both be vindicated. But it can seldom be reasonable to
tax the industry of the great body of the people, in order to
support that of some particular class of manufacturers.
However, in a season of great prosperity, when the public
enjoys a greater revenue than it knows well what to do with,
it may, perhaps, be as natural to give such bounties to fa-

vourite manufacturers, as to incur any other idle expense.
In public, as well as in private expences, great wealth may,
perhaps, frequently be admitted as an apology for great folly,
but there must surely be something more than ordinary ab-

duridity in comming such profusion in times of general diffi-
culty and delights.

When a bounty may be considered as a drawback, it is not
liable to the same objections with that which is properly a
bounty. Thus, the bounty upon refined sugar exported is
kind of drawback of the duties upon the brown and
muscovado sugars from which it is made. That species of
refined sugar upon which the bounty is granted is denomi-
nated, in the statute-book, "sugar in the loaf and whole,
being nett." Upon the export of this sort of sugar the
bounty was raised by 5 Geo. III. c. 47; to 14s. 6d.; and
a further bounty of 11s. 6d. was granted by 21 Geo. III. c. 10, in consequence of an additional duty of 6s. per cwt.
paid in 1781 on raw sugar imported. The whole bounty
amounts to 26s. per cwt. When parliament, in 1791, by
21 Geo. III. c. 15 laid a further duty of 28. 8d. per cwt.
on raw sugar imported from the British plantations, making
the import duty 15s. per cwt. in the whole, no addition was
made to the bounty on the export of refined loaf. But as
an addition was made of 35. 4d. to the drawback, on what
the statute calls "ballasts, and ground powdered fugar," and
also on "refined loaf broken into pieces," and all sugar
called "candy." It was proposed in 1791, when the addi-
tional duty of 28. 8d. was moved, to augment the bounty in
the usual proportion; but the sugar refiners remonstrated
against the measure, as being, according to their statement,
beneficial only to the planters. By a subsequent law it is
enacted, that, after the year 1793, whenever the average
of the prices of brown or muscovado sugar (taken weekly
upon oath before the lord mayor of London, and published
in the Gazette) shall exceed, in the six weeks respectively
preceding the middle of February, June, and October, the
amount of 50s. per cwt. (exclusive of the duty), the draw-
back on raw sugar exported is immediately to cease for four
months, and the bounty on refined is to cease during a like
term, but commencing after an interval of one month. From
a statement made by Mr. Bryan Edwards (Hist. of the West
Indies, vol. ii. p. 452.) it appears, that the apparent loss to
the revenue, arising from the bounty, is no more than one
shilling the cwt. But as every loghead of sugar lofs con-
iderably in weight, after the duty is paid, and before it is
either exported or worked up, and the duty is often paid for
more than the casks really contain, by the strict regulations
re-

The bounty upon wrought silks imported, is also a drawback of the duties upon raw and thrown silks imported. See Silk.

The bounty upon gun-powder is a drawback of the duties upon brimstone and saltpetre imported. In the language of the customs, those allowances are called drawbacks, which are given upon goods imported in the same form in which they are imported. When that form has been altered by manufacture of any kind, as to come under a new denomination, they are called bounties. Bounties are sometimes called premiums, as drawbacks are sometimes called bounties.

Having given a compendious abstract of Dr. Smith's reasoning against the system of bounties, particularly as it is applicable to the exportation of corn, we shall now advert to the arguments alleged by the advocates of this system in its favour. Among these advocates we may reckon Dr. James Anderson, in his letters entitled "Observations on the means of exciting a spirit of national industry, &c." 1740–1777, and his "Call for Investigation of the circumstances that have led to the present scarcity of grain in Britain," 1780; Mr. Driar in "An Inquiry into the corn laws and corn trade of Great Britain, &c." 1798; Mr. Mackie, in a "Supplement" to the last-mentioned work; and Mr. Maltheus, in his "Essay on the principle of population, &c." 1803.

Some of the earlier topics, from which arguments were deduced in favour of the bounty, were its great encouragement of British shipping, and the gold it brought home for paying the balance of exported corn. But exclusively of these arguments, the advocates for the bounty urge, that, by forcing a production of corn, greater than the annual consumption of the home market, the bounty provides a reserve against years of deficient crop; that it secures an adequate profit to the farmer; that it reduces the prices of corn, which are usually very fluctuating, to a greater uniformity and steadiness; and that it makes this uniform price rather lower than it otherwise would be. From such considerations, Dr. Anderson, and others, on the same side of the disputed question with himself, have inferred, that, setting aside the innumerable beneficial effects of a well regulated and efficient bounty on the exportation, aided by a duty on the importation of corn, with regard to the population, industry, manufactures, commerce, national wealth, public tranquillity, and augmentation of revenue, it is a case fraught with multiplied advantages; and "that it could not be abandoned," such is the strong language of Dr. Anderson, "without endangering the welfare of the people and the very existence of this kingdom, as an independent nation."

Upon the four preceding propositions it has been observed by an anonymous writer, seemingly well acquainted with the subject (Edinburgh Review, No IX.), that the promised readjusts in the price of corn must be derived from that surplus of produce which is to be reffered in years of a bad crop; this surplus of the average produce above the annual consumption, must be the result of an enlarged encouragement of tillage; and this encouragement, operating by an augmentation of the profits of the farmer, must ultimately contri-
pical opinion. In endeavouring to shew, that the enhancement of price, occasioned in the home market by the bounty, must restrain the population or the industry of the country, he proceeds upon the above-mentioned assumption, that the bounty occasions an immediate rise of the money-price of corn; and may, therefore, either reduce the subsistence of the labourers, or, if wages rise, the abilities of their employers to give them work. If that rise of money-price, however, is consequent, as the anonymous writer argues, to an extension of demand in the foreign market, it will at first increase the ability of those employers; and though it will likewise reduce at first the subsistence of the labourers, their wages must soon rise to their true rate; and this rise in the money-price of labour, will only reduce the ability of the employers to its former level.

The anonymous writer, after these criticisms on the reasoning of Dr. Smith, proceeds to specify some of the errors into which the advocates for the bounty have fallen, which are of a more palpable kind, and which proceed from an imperfect acquaintance with the principles of political economy. In the first place, they have misunderstood Dr. Smith's important doctrine, that the variations of the money-price of corn are communicated ultimately to the labour, and other commodities. Whilst they infer, that the price of commodities and labour is liable to be affected by many other circumstances, besides the price of corn, they advance a truth, in itself unquestionable, and not incompatible with Dr. Smith's proposition, which merely affirms, that every change which the bounty may occasion in the money-price of corn, will communicate itself, first to the money-wage of labour, and, through them, to the money-price of all other articles; and thus, the real price of corn will be maintained the same, notwithstanding a nominal variation. In the second place, they feign very imperfectly aware of the manner in which the principle of competition operates upon profits, and upon exchangeable value; and, on this account, many of their remarks are inconsistent as well as unfounded. They have supposed, with Dr. Smith, that the sum of the bounty is immediately added to the former money-price even in the home-market, and, at the same time, contend, that the average-price in that market will be lowered. It is also their opinion, that the real price of corn will, upon the whole, be rendered cheaper to the consumers, and that the same real price of corn will be maintained permanently higher to the farmer; though these two positions are, in direct terms, contradictory to each other. Dr. Malthus observes, that the bounty greatly lowers the price of corn, by producing a growth considerably above the wants of the actual population; whilst he forgets, that a greater growth can only be occasioned by a greater demand, to which it will be always adjusted; and, keeping the supply and the demand always in the same ratio, will in other words keep the price always at the same rate. But the advocates for the bounty have betrayed a much less pardonable inattention to the necessary action of the principle of competition, when they conceive, as some of high authority have done (See Reports of the committee of the house of commons respecting the corn trade, ordered to be printed May 14th and June 15th 1834), that the average price of grain in the home market may be so low as not to yield a fair and reasonable profit to the grower. Besides, Dr. Smith and his opponents have pronounced, that, in years of extraordinary abundance, the bounty will prevent the money-price of corn in the home-market from falling quite so low, as it would fall if there were no bounty. Dr. Smith, indeed, is consistent with himself, because he uniformly maintains, that the bounty can have no effect in rendering the annual produce larger than it otherwise would be. But those who affect this position, and assume that the bounty increases the produce, and occasions a surplus growth above the annual consumption, evidently incur the charge of inconsistency. For this surplus will, in a year of extraordinary abundance, partake of the extraordinary increase; so that over and above the usual home supply, there will, in such a year, be reaped not only the extraordinary increase upon that supply, together with the usual surplus for exportation, but likewise the extraordinary increase upon that surplus. Of these four portions of the crop, therefore, not only the second, but the fourth also, will be thrown as an excess upon the home-market; and the price in this market will consequently be lowered much more by the whole of this excess than it would have been by the former part of it alone.

The ingenious writer, to whom we are indebted for these remarks, suggests that a bounty upon export may, in a particular manner, afford some temporary encouragement to tillage; and thus, to a certain degree, force the production of a surplus, which may be referred for the home-market in deficient years. By preventing, in such years, the temporary price from rising so high as it otherwise would, it may be considered as restraining a little on one side the occasional fluctuations of the price of corn; but, by overlocking the home-market in plentiful years still more than it would otherwise be overlocked, it must be considered as giving a still greater range to the fluctuation of the temporary price on the other side. Whilst the bounty has this influence upon the temporary changes of real price, its effects upon the nominal price of corn will be to raise and keep it higher than it otherwise would be. If the encouragement to tillage, derived from a bounty, should be deemed a sufficient benefit to induce a great nation to establish it; it should be remembered, that, though it may indirectly secure a more certain supply of corn, it necessarily retards, upon the whole, the growth of national opulence and industry. It forces a part of the national capital into a branch of trade, which is unavoidably a losing one, and which does not return the whole of the capital that is employed in it; for the whole sum granted in bounties, together with the expenses of collecting the tax for defraying them, is a part of the national capital thrown into that trade without any return. After exhausting its full amount the possible benefit is to be derived from such an artificial contrivance as the bounty, we should not allow against that, both the immediate sacrifice and all the subsequent disadvantages, but we ought also to consider whether the very benefit proposed, at least in one point of view, might not be better obtained in another way; by the removal of any existing impediments to cultivation, to the free commerce of land, the free employment of capital, or the free transference of labour. Besides the sacrifice of capital that is incurred by bounties, there is a disadvantage arising from that constant diminution of the real wages of labour, which is occasioned by the progressive rise of the price of corn in the home market; other disadvantages are incurred from the constant enhancement of the money-price of labour and all other commodities, both in the depreciation of fixed pecuniary returns, and in the injury to domestic manufactures, with regard to their competition against foreign industry. Moreover, another disadvantage, perhaps still greater, consists in the uncertainty and derangement to which interferences of law subject the capital that is invested in the trade of grain, and the obstacle opposed by them to the free enlargement and codification of this most important system of commerce. On the other hand, it should be considered, that the encourage-
rangement which any assigned bounty will give to husbandry, and which, for the same purpose, it will inevitably do, so high as to cover the whole advantage, which the bounty would originally give to the exporter in his sales abroad; and the whole encouragement which, in the mean time, the bounty can give to agriculture, will be found to be very slight, when it is considered in what way it is formed, and that it consists, not in the addition of the whole bounty to the farmer's price, but in that small addition to his price which is occasioned from time to time by the gradual extension of foreign demands. In reference to the present circumstances of this country, it ought also to be recollected, that, when the average price of corn at home is greater than that of the foreign market, the interval of encouragement to tillage, under the same bounty, will be shorter than in the other two cases, and the whole disadvantage of high money prices will be sooner brought to its greatest height.

Adverting to the present state of the agricultural produce of our own country, and what has caused an alarm to some of our legislators as well as political writers, we are happy in adopting the opinion of those who think it unnecessary. If, besides being dependent in years of scarcity on very large imports from abroad, we are even in ordinary years dependent upon importation for a certain portion of our necessary supply, it seems, admitting the fact, to be only a temporary and slight inconvenience. It is doubted, whether, in this case, a bounty upon exportation, and the prohibition of importation, furnish the most suitable and effectual remedy: and it is not unreasonably suggested, that an entire freedom of importation, continued with a bounty upon production, augmented from time to time, might have appeared at least a more plausible proposal.

Nothing can be more unfounded than the fear, which some advocates for the bounty have expressed, that England may cease to be an agricultural nation; except the lamentations, which others have indulged over the actual decline of its husbandry, since that which has been called the fatal statute of the year 1773. It should be recollected that, from year to year of this period, the husbandmen of Britain have extended their capital, their skill, and their produce, though the commerce and manufactures of the island have in some measure concealed its agricultural grandeur.

The bounty seems to have recommended itself to some of its admirers, as a simple expedient for securing, by paying a few millings at the custom house, such a surplus of annual produce as will equalize the variation of value, and establish a remedy against the natural inconvenience of the seasons. In this view of it, the bounty is to accumulate, by a kind of mechanical operation, a surplus of produce, for supplying an occasional deficiency; and it is to act as a regulator of the price, against the circumstances that tend to enhance or to depress it. If it is capable of doing so much, it may also do more; and serve to repress, as Mr. Malthus has inferred, the principle of population a little in years of plenty, and to encourage it comparatively in years of scarcity; regulating, in this manner, the population more equally, according to that quantity of subsistence which can permanently be supplied. It is well observed, that a measure can rarely be wisdom for one great state, which may not be permanently followed by all. All cannot, by adopting the bounty, secure to each an export of grain; and the single nation that flows from the plain high maxims of policy to such an artifice, will ultimately be convinced that the advantage gained by it, if any, must be very inconsiderable. The balance of this trade cannot long be very great to any nation; and it will be naturally poiffed by that one, whose capital and skill are in

BOU

a condition to furnish the additional supplies most advantageously to all. In this condition, if the exportation is free, it will hold the balance, without requiring the aid of a bounty; nor can a bounty give it the balance, if it be not in that condition.

Having stated, as briefly as possible, the principal arguments on both sides, for and against a bounty, we shall close this article with a short abstract of the history of this commercial institution. The prices of corn had been variable during the 17th century, and in general so high, the average price of wheat for fifty years before 1650 having been 6s. 8d. red. and from 1650 to 1700 3l. 0s. 1d. per quarter, that the attention of the legislature had frequently been directed to this object; and various attempts had been made to revive agriculture, with a view of redressing this evil, by encouraging the exportation, and checking the importation of corn; but none of them had proved effectual. Towards the end of the century, however, the prices had been so uniformly high, and on some occasions so oppressive, as to induce the truly patriotic and judicious administration under William and Mary, immediately after the revolution in 1688, to investigate some method of remedying this evil, and of preventing its future recurrence. With this view, a resolution was adopted of granting a certain bounty upon the exportation of corn, when the crops were so abundant as to reduce the price below the rate which they conceived to be necessary for indemnifying the farmer for his expense and trouble, so as to enable him to find for it a foreign market; and with a view also of preventing a competition of foreigners in our home market, when the crop happened to be uncommonly abundant, and of guarding against the machinations of corn-dealers, who might, for their own lucrative purposes, occasionally introduce much foreign corn into the home market, so as to lower the price of a moderate crop in Britain below its intrinsic value, they imposed certain duties on corn imported, which rose or fell in proportion to the selling price at the time in our own market, as protecting duties. The aim of the legislature, in these regulations, was to preserve, as much as possible, an equality and moderation of price at all times in the home market. Such were the principles of the corn law, first enacted in the year 1668 by W. and M. and finally completed in 1700 by 11 and 12 W. and M. c. 20. By the law of 1668, a bounty of 5s. was granted for every quarter of wheat exported, when the price was at or under 48s. per quarter; and by the same law, there was payable on importation a duty of 1l. 4s. per quarter, when the price did not exceed 3l. 19s. 3d.; when the price was above that, and not exceeding 6l., the duty payable was 12s. per quarter; and when the price was above 6l., the duty was only 8s. This commercial regulation was much celebrated by the best writers and statesmen of England, throughout the first part of the last century; they always mentioned it with admiration, as an institution that had been wisely planned, and that had completely succeeded; and it was ranked with the art of navigation, the laws for the woolen staple, or queen Elizabeth's provision for the poor, as an inseparable part of that peculiar system, to which England was indebted for her superiority over all other nations. The diminution of the average price, and the progressive increase of exports, within the period at the beginning of which the bounty had been instituted, presented a flattering coincidence; and at a time when the analysis of national wealth was unknown, it was natural enough to believe, that the cause of these curious facts could be no other but that remarkable law which just preceded their appearance. As a perceptive regulation, Dr. Anderson considers it as one of the highest exertions of
human will; for the beneficial tendencies that have resulted from it in practice, and to which we can now refer as facts to form our judgment, could be only contemplated by the devisers of that law as plausible probabilities. By the operation of this law, the prices in the home market were reduced, in the course of 50 years, to the consumers in the home market, from 31. to 11. 12s. 6d. per quarter; and we were enabled by it to export corn till our exports of exports rose by degrees to the amount of more than one million and a half quarters in one year, which brought into the country a sum not much under three millions sterling; being paid for the price of our own salt manufactures, and for encouraging the most useful kind of industry that can ever be promoted in any nation. Similar sentiments with regard to king William’s corn law were adopted by our admirers upon the continent. The bounty became a theme of panegyric in all their political treatises. Though a most artificial expedient, it was applauded even by the economists of France, in whose profound writings all devices were reproved, that might check the spontaneous order of nature. Dr. Smith, however, maintained that the system of laws, which is connected with the establishment of the bounty, seems to deserve no part of the praise which has been bestowed upon it. The improvement and prosperity of Great Britain, which have been so often ascribed to those laws, may very caily be accounted for by other causes. That security which the laws in Great Britain give to every man, that he shall enjoy the fruits of his own labour, is alone sufficient to make any country flourish, notwithstanding these and twenty other absurd regulations of commerce; and this security was perfected by the revolution much about the same time that the bounty was established. The natural effort of every individual to better his own condition, when suffered to exert itself with freedom and security, is so powerful a principle, that it is alone, and without any assistance, not only capable of carrying the society to wealth and prosperity, but of furnishing a hundred important obstructions with which the folly of human laws too often incumbers its operations; though the effect of these obstructions is always more or less either to encroach upon its freedom, or to diminish its security. In Great Britain industry is perfectly secure; and though it is far from being perfectly free, it is as free, or more free, than in any other part of Europe. Upon the whole, though the period of the greatest prosperity and improvement of Great Britain has been posterior to that system of laws which is connected with the bounty, we must not on this account impute it to those laws. It has been posterior likewise to the national debt; but the national debt has most assuredly not been the cause of it. The sentiments of Dr. Smith were adopted by many philosophical inquirers; and at length they approved themselves to our legislators, and became a subject of parliamentary deliberation. Accordingly the act of 1773, (13 Geo. III. c. 43; see also Stat. 31 Geo. III. c. 30. 32 Geo. III. c. 50. 33 Geo. III. c. 3, 65;) which was conducted through the house of commons by Mr. Burke, effected a virtual repeal of the bounty, though it retained the language, and seems to have been a legislative act, granting a bounty, makes a total balance of trade against us, in this single article, of not less than nine millions sterling per annum. These facts seem to have made a great impression on several ingenious and well informed minds; the bounty has once more found advocates among some political writers of great merit, and among several statesmen; and a statute has been lately passed, which, it is expected, will produce all the beneficial effects that have been ascribed by its advocates to the old bounty. The committee of the house of commons, in their second report, ordered to be printed June 14th, 1804, deliver their opinion in these words: “It appears to the committee, that the price of corn from 1791 to the harvest of 1803 has been very irregular; but, upon an average, increased in a great degree by the years of scarcity, has in general yielded a fair profit to the grower. The usual high prices, however, have had the effect of stimulating industry, and bringing into cultivation large tracts of waste land; which, combined with the two last productive seasons, and other causes, have occasioned such a depression in the value of grain, as it is feared will greatly tend to the discouragement of agriculture, unless maintained by the support of parliament.” Accordingly an act was passed July 30th, 1804, (44 Geo. III. c. 102;) to regulate the importation and exportation of corn, and the bounties and duties payable thereon. Without the aid of this new statute, it has been said, that the
the farmer cannot be sure of obtaining, even in the home market, a fair and reasonable profit. By those who have disapproved this measure, and who, adopting the general principles of Dr. Smith, are adverse to a bounty, it has been alleged, that, like other arts of trade, that of the farmer is liable occasionally to the spirit of overtrading, if profits for a time have happened to be greater than ordinary. The late years of dearth and most extraordinary price, they say, rendered the profits of farming, for the time, much greater than ordinary: and the consequence appears to have been a pretty free indulgence of the disposition to trade too much, and to enter into projects disproportioned to the capital that would immediately be invelled. In many instances, where farmers came to make a new agreement about rent, they reckoned too confidently upon the continuance of prices which they ought to have considered as unusual; and made the estimate of their future returns too much upon the recent rate of profit, and not upon an average sufficiently and reasonably large. Like other improvident speculators, they were, of course, to suffer for their want of foresight, as soon as prices and profit returned to their ordinary rate. Hence it has happened, that those farmers who had overtraded, and who found it difficult to make good their imprudent engagements, found it almost as easy to persuade other persons as themselves, that prices are much too low. Their landlords, in particular, are not the persons most likely to discover that prices are not too low, but rents a little too high; and they may honestly find it somewhat difficult to be convinced, that the embarrassment of their tenants is owing to that local cause, and not to something that affects the general condition of the country. To this purpose, it is said, in a pamphlet by a member of parliament, entitled, "Curiosity Observations on the act for ascertaining the bounties, &c." 1804, that "times, unfortunate in other respects, impressed on tillage a renovated vigour; a vigour which the principles of this act, and those alone, are able to sustain." By this statute it was enacted, that, from and after November the 15th, 1804, to much of the statute 3 Geo. III. c. 30. as regulates the prices at which British corn, grain, malt, meal, flour, and biscuit, may be exported, except to Ireland, and at which foreign corn, grain, meal, and flour, may be imported, except from Ireland, and as fixes the duties and bounties payable thereon, shall be repealed. By this statute it is further enacted, that the importation and exportation of corn, into and from England and Wales, shall be regulated by the average price of the twelve maritime districts; and into or from Scotland, by the average price of the four districts in Scotland; and that the bounties and duties shall be regulated by schedules, annexed to this act; that whenever the average shall be under the prices at which corn may be importable into Great Britain and Ireland, on the low duties from foreign parts, exportation shall be allowed from Great Britain to Ireland, &c.; and that the importation and exportation of corn, into and from Ireland, shall be regulated by schedules, annexed to this act. The first schedule fixed the prices to which the scale of bounty is to attach on the export of corn, &c. and the prices at which the exportation is prohibited. By this schedule, wheat may be exported, when at or under 48s. per quarter, with a bounty of 5s.; rye, at or under 32s. with a bounty of 3s.; peas and beans are exportable without a bounty, till at or under 35s.; barley, beer, or bigg, or malt made of barley, beer, or bigg, may be exported at or under 28s. with a bounty of 2s. 6d.; oats, at or under 16s. with a bounty of 2s.; wheat flour, biscuit, &c. with a bounty of 1s. 6d. per cwt.; wheat meal, with a bounty of 1s. 3d. per cwt.; barley, beer, or bigg, meal, with a bounty of 1d. per cwt.; and oatmeal, with a bounty of 1s. per cwt. But when the price of wheat exceeds 53s. that of rye 35s., that of peas and beans 35s., that of barley, beer, or bigg, or malt made of them, 30s., and that of oats 20s., no export is allowable. The second schedule shows the prices, according to which high or low duties are to take place on importation. When imported from the province of Quebec, or the other colonies or plantations in North America, wheat under 35s. per quarter is subject to the high duty of 24s. 3d. per quarter; at or above 53s. but under 56s., to the first low duty of 2s. 6d.; and at or above 56s. to the second low duty of 2d. per bushel, and beans, under 35s. per quarter, are subject to the high duty of 22s.; at or above 35s. but under 56s., to the first low duty of 2s. 6d.; and at or above 56s. to the second low duty of 2d.; oats under 17s., pay the high duty of 6s. 7d.; at or above 17s., under 18s. the first low duty of 1s.; and at or above 18s. the second low duty of 2d.; oatmeal, if under 16s. 6d. per bushel of 150 lbs. avordupois, or 128 lbs. Scotch troy, is subject, for every bushel, to the high duty of 8s.; at or above 16s. 6d. per bushel, but under 17s., to the first low duty of 1s.; and at or above 17s., the second low duty of 2d.; barley, beer, or bigg, under 31s. 6d., pays the high duty of 1s. 6d.; and at or above 44s. the first low duty of 1s. 6d.; and at or above 44s., the second low duty of 2d.; barley, beer, or bigg, under 31s. 6d., pays the high duty of 1s. 6d.; and at or above 33s. the first low duty of 1s. 3d.; and at or above 33s. the second low duty of 2d.; oats under 21s., pay the high duty of 6s. 7d.; at or above 21s., but under 22s., the first low duty of 1s.; and at or above 22s., the second low duty of 2d.; oatmeal under 22s. per bushel, pays the high duty of 8s.; at or above 20s., but under 21s., the first low duty of 1s.; and at or above 21s., the second low duty of 2d. The third schedule shows the prices to which the scale of bounty attaches on the export of corn, ground corn, flour or meal, malt, &c. from Ireland, and the prices at which the exportation is prohibited. When exported to any foreign country, wheat, at or under 29s. 5d. per barrel, Britifh, is allowed a bounty of 3s.; rye, and also peas and beans, at or under 20s. 4d., a bounty of 1s. 10d.; barley, beer, or bigg, or malt made of these, at or under 16s. a bounty of 1s. 5d.; oats, at or under 15s. 2d. a bounty of 1s. 3d.; wheat, flour, biscuit, &c. a bounty of 1s. 6d. per cwt.; wheat meal, 3s. 3d. per ditto; rye meal or flour, 9d. per ditto; barley, beer, or bigg flour, 10d. per ditto; and oatmeal, 1s. per ditto. When the price of wheat exceeds 53s. 1d. per barrel, British; of rye, peas, and beans, 22s. 3d.; of barley, beer, bigg, or malt made of them, 17s. 8d.; and of oats, 12s. 2d., no exportation is allowed. The fourth schedule shows the prices, according to which the high or low duties are to take place on importation into Ireland; for which, and other particulars, we refer to the act itself.

**Bounty, Queen Anne's**, for augmenting poor living's under 50l. per annum, commits the produce of the first fruits and tenth, after the charge and expenses payable out of the same are defrayed. A corporation for management of the same was settled, &c. in 1704. See Augmentation and First Fruits.

By flat. 44 Geo. III. c. 2. the sum of 8000l. was granted out of the consolidated fund to the governors of queen's
Anne's bounty, for the relief of curates deprived of their cure on account of the residence of incumbents, in consequence of the act 43 Geo. III. c. 84. But no curate is entitled to receive any allowance under the act, who shall not produce to the said governors a proper recommendation from the bishop of the diocese in which the cure is situated, and no allowance shall exceed three-fourths of the income foil.

BOUPER, Lé., in Geography, a town of France, in the department of the Lower Pyrenees; 10 miles S. W. of Mauleon.

BOUQUENON, a town of France, in the department of the Meuse, and chief place of a canton, in the district of Bitche on the Sarre; 5 leagues S. W. of Bitche.

BOUQUETIN, in Zoology, the wild goat. See Capra ibex.

BOUR, in Geography, a town of Aftic Turkey, in the province of Caramania; 4 miles S. E. of Akkeran.

BOURAC, a town in the Arabian Irak; 70 miles S. S. E. of Baghdad.

BOURBACH, or Grand-Bourbach, a town and castle of Germany, in the circle of Weilphalia, and principality of Nassau-Dillenburg, near which is a lead mine; 9 miles W. of Dillenburg.

BOURJON, Nicholas, in Biography, a famous Latin poet in the 16th century, was a native of Vandeure, near Langres; and appointed by Margaret de Valois preceptor to her daughter, Jane d'Albert of Navarre, the mother of king Henry IV. He died at Condé whither he had retired, and where he had a benefice, about the year 1572. He wrote eight books of "Epigrams," commented by Enfans, and a poem on the forge entitled "Ferraria." He was distinguished for his knowledge of antiquity and of the Greek language.

Bourbon, Nicholas, a celebrated Latin and Greek poet, was nephew of the former, and son of a physician at Bar-le-De., where he was born about the year 1574. He taught rhetoric in the colleges of Paris, and was nominated by cardinal Du-Perron, in 1611, professor-royal in Greek eloquence. He was canon of Orleans and of Langres, and a priest of the oratory, though he declined the title. In 1637, he was admitted by cardinal Richelieu a member of the French academy, without soliciting the honour. He died at the house of the fathers of the oratory in 1644. As a Latin poet, he obtained the highest rank in France, and has been thought, if not superior, equal to any who lived in the two last centuries. In his verses he has combined a considerable portion of poetical fire with elevation of style and sentiment; and he has been charged with making Lucan and Claudian, rather than Virgil, his models; their manner being probably better adapted to the waste of his conceptions. His master-piece is said to be an "Imitation against the parricide of Henry IV." His poems were printed at Paris in 1651 and 1720. He also wrote Greek, as well as Latin verses, and in the latter language some pieces of prose. His taste was refined and accurate; and as he was much addicted to the use of wine, he expressed his contempt of the French poetry, by saying, "When I read French verses, I think I am drinking water." Although he was afraid of starving, 15,000 livres were found in his strong box at his death. Bourbon published an edition of St. Cyril's work against the emperor Julian, with a Latin translation. Nouv. Dict. Hist.

Bourbon, île de, in Geography, lately called île de la Réunion, an island of the Indian ocean, about 570 miles distant from the coast of Madagascar to the east, and at the distance of about 50 miles to the west of the island of France, was first discovered by the Portuguese, in 1545, who called it Madagascar, after the name of the commander of their fleet; and this appellation was afterwards corrupted into Malagaine. In 1642, Pronis, the commandant at Madagascar, took possession of the island for the French government; and seven years after, says La Barthe, in his "Annales maritimes et coloniales," but, according to others, in 1654, the new commandant, M. de Flancourt, took possession of it again in the name of his sovereign, and gave it the name of Bourbon. He introduced into it domestic animals, which multiplied considerably; and, on account of its fertility, several Frenchmen formed in it settlements. In 1665, two ships of De la Haire's squadron arrived here, and left Renaud, an "officer d'administration," together with 20 labourers. The French, who, in 1671, escaped the massacre at Fort Duaplins in Madagascar, fled to this island; and various sea-faring persons settled in it, and employed themselves in agriculture. From the site of France to this island, the passage may be performed in a day, but the return often requires a month. It is about 40 miles in length, and 30 in breadth. The shores are exceedingly steep, and cannot be approached except by small vessels, without danger. On this account it has few ports; but round the island there are several good roads where ships may ride securely. The soil is more sandy than that of the island of France; and at some distance from the shore it is mixed with thole smooth stones, which cover the bottom of the sea. In those parts, however, which admit of cultivation, the ground is excellent, and well watered by various streams that are supplied in summer by the melting snow, which in winter covers the tops of the mountains. The soil, thus manured, though not deep, is very fertile, and produces Turkey corn and rice, twice a year, and of the latter a great abundance. The mountains are very high; and the three inaccessible peaks, called the "Salle," are said to be 1500 toises. In the southern part of the island there is a tremendous volcano, the district round which, called "pays bleu," is entirely burnt up; and there are many gullies, the declivities of which are so steep that they cannot be cultivated. The island is divided into four quarters. The height of St. Paul, which is the largest and most populous. Their houses are built at the foot of a steep mountain, on both sides of a fresh water lake. Their plantations are on the top of a mountain, which they ascend by a very steep and toilsome passage. On the summit, however, is a spacious plain, divided for the most part into plantations of rice, tobacco, corn, sugar canes, and fruit-trees. The sea at the port of St. Paul is calmer, and the anchoring ground more secure than at St. Dennis; nevertheless, mariners prefer the latter. The quarter of St. Dennis, lies 15 miles from that of St. Paul towards the east; and here the governor resides. This district is more pleasant, though less populous, than the other. The chief port in the island is that of St. Dennis, where a draw-bridge, secured by iron chains, has been constructed for the purpose of enabling boats to land. This bridge extends more than 800 feet into the sea; and at the end of it is a ladder of ropes by which people who wish to go on shore must ascend; in all other parts of the island they must jump into the water. At two leagues from St. Dennis, proceeding along the coast, is the quarter of St. Mary's, which is thinly peopled. The lair and most fruitful district of the island is that of St. Susanne, four leagues from St. Dennis; the passage from one to the other having been with great labour cut through a wood; but the passage from St. Dennis to St. Paul is only by sea.

The sky in this island is serene, the atmosphere pure, and the water savourous. Although the climate is hot, the breezes from the mountains are refreshing; and the hurricanes, which
which commonly occur once or twice every year, contribute to purify the air, and to preserve its salubrity. The island, which the French found at their settlement almost a defect, abounds in fruit, grapes, and cattle of various kinds; the wild goats and wild hogs have retired to the woods and umer-
ness of the mountains; the land tortoises were formerly abundant, but are now found only in the western part, these of the other parts having been exterminated by the crews of ships that have touched upon the island. The rabbits, quails, partridges, and pintades, brought to the island, have none of them increased, except the last. It is said that no venomous animals are found in this island; nor any disagreeable to the sight, except spiders, of the size of a pigeon's egg, which weave very strong nets, capable, as some say, of being rendered as valuable as silk, and a kind of large bats, denominated "oifein bleu," which are skilled and eaten as a great delicacy. The rivers are well stocked with various sorts of fish. Among the vegetable productions we may reckon tobacco, sugar-canes, cotton, tobacco, sarsaparilla, white pepper, the cotton flax, abundance of timber fit for ship-building; and several kinds of fruits, such as the guavas, bananas, citrus, tamarinds, lemons, and oranges. On the shores are found ambergris, coral, and many beautiful shells.

In the year 1717, the number of inhabitants in this island was computed at 2000, viz. 900 free, and 1100 slaves; and with regard to their disposition, they are, generally speaking, gentle and quiet, very industrious, and submissive to just and mild authority; but when it is otherwise exercised, apt to associate and unite in rebellion. In 1763, the population amounted to 4637 white people, and 13,149 blacks; the cattle consisted of 8724 beves, 4814 sheep, 7495 goats, and 7619 hogs. Upon an extent of 125,900 acres of cultivated land, they gathered as much cotton as they could raise their slaves, 1,135,000 pounds weight of grain, 84,100 pounds of rice, 29,9100 pounds of maize, and 2,535,100 pounds of coffee, which last the company bought up at 3d. per pound. Labarthe says, this island produces annually 55,700 weight of corn, 54,300 of maize, and three millions of pounds of coffee. Ever since the French India company became established possessors of this island, they have directed their attention to the improvement of its cultivation; and with this view, they imported into it coffee-
trees from Arabia, which have succeeded so well, as to produce an eighth, and according to some, a fourth part as much coffee as is raised in the Arabian kingdom of Yemen, and next to that in quality. The French have also cultivated tobacco and tobacco leaves, to render the island almost inaccessible. When admiral Bofchen appeared before this island with a British fleet in 1748, he found it to be fortified both by nature and art; that, after some ineffectual cannonading, he was obliged to pursue his voyage. 6 lat. 20° 51' 43" E. long. 55° 59'; which is the longitude of the port of St. Denis, according to the Connaissance des Temps, an. viii.

agel. N. lat. 11° 45'. W. long. 15°.

BOURBON, a county of America, laid out and organized in 1783, by the state of Georgia, in the S. W. corner of the state, on the Mississippi, including the Natchez country. Having continued under the jurisdiction of the Spanish ever since their conquest of this part of the country in 1763, it was given up to the United States by the treaty of

BOURBON, Fort, lies in the island of Martinico, in the W. Indies. Altogether, the name given by the French to a principal port in North America, situated on a small island which divides it from Mid-lake; which see.

BOURBON (Archeolands), a town of France, in the dep.
artment of the Alpes, which gave name to a county and to the house of Bourbon; celebrated for its hot medicinal waters and baths. It contains two hospitals and about 2000 inhabitants; 4 leagues W. of Moulins. N. lat. 46° 35' 22". E. long. 4° 39' 39'.

BOURBON, a town of France, and principal place of a district, in the department of the Saone and Loire, celebrated for its mineral springs. It contains three parishes and two hospitals. Its large bath, encompassed with circular walls, and paved with marble, is a work of the Romans; 3 leagues S. W. of Autun. N. lat. 46° 37'. E. long. 4° 50'.

BOURBONNE &c. Bains, a town of France, in the dep.
artment of the Upper Marne, and chief place of a canton, in the district of Langres; the place contains 3136 inhabitants, and the canton 11,925; the territory comprehends 2244 square leagues, and 16 communes. It takes its name from its hot baths; 6 leagues E.N.E. of Langres.

BOURBONNOIS, a province of France, before the revolu-
tion, now the department of Allier, bounded on the east by Burgundy, on the north and west by Nièvre and Berry, and on the south by Auvergne; its climate is very temperate, and it produces in great abundance hemp, flax, wine, potatoes, and wood; it has also found mines of coal, and medicinal springs. Its capital is Moulins. This province was erected into a duchy of France by Philip de
Valois in 1520, in favour of Louis, son of Robert, the youngest son of St. Louis. This duked had two sons, Peter and James; from the latter of whom deftended the house of Bourbon, which was the reigning family in France.

BOURBOURG, a town of France, in the depart.
ment of the North, and chief place of a canton, in the district of Bergues, seated on a navigable canal which communicates with Calais, St. Omer, Dunkirk, Gravelines, &c.; 3 leagues S. W. of Dunkirk, and 3 S. E. of Gravelines. The town contains 2986, and the canton 9466 inhabitants; the territory comprehends 160,000 hectares and 13 communes.

BOURBIAC, a town of France, in the depart.
ment of the North coal, and chief place of a canton, in the district of Guingamp, 5 miles S. of Guingamp. The town contains 2977, and the canton 7646 inhabitants; the territory includes 155,000 hectares and 7 communes.

BOURCHET, a town of the duchy of Luxemburg,
4 miles N. W. of Diekirch.

BOURCHIER, Bowshier, or Bowser, Thomas,
in Biographia, archbishop of Canterbury in the suc-
cessive reigns of Henry VI., Edward IV., Edward V., Richard III., and Henry VII., has no particular claim to notice, otherwise than as he was the principal instrument in introducing the art of printing into England. By defeat, he was related to the noble families in England, being the son of William Bourchier earl of Ferr, in Norfolk, and by his mother, the countess of Stratford, great grandson to Edward III. He was born at Hawskley in Elfre, one of the family seats of the Bourchiers or Bourciers, educated at Oxford, and held the office of chancellor of that univer-
sity,
fitz, from 1413 to 1417. After several inferior preferments in the church, he was elected bishop of Worcester, in the former of these years; invested by the king, with the temporalties of this see in 1435, and consecrated in 1436; his age not allowing of its being done sooner. In 1434, he was elected archbishop of Canterbury, and preferred over the church during 32 years, in the most distracted period of the English government. He enjoyed the prelacy 51 years from the time of his first consecration; an honour of longer duration than any which occurs in the English history, if we except the case of bishop Hough, who was bishop for about 52 years. He was promoted to the office of lord high chancellor of England in 1455, and resigned it, according to Rymer, in the following year, but according to Dugdale, in 1457. In 1464, he received the red hat from Rome, being created cardinal-priest of "St. Cyricus in Thermis." Soon after his advancement to the see of Canterbury, he visited his diocese, and instituted several regulations for the government; and he likewise published a variety of constitutions for the reformation of the clergy and laity, and for restraining the excesive abuse of papal provisions.

Among his benefactions, it is recorded, that he gave to the prior and convent of Christ-church in Canterbury, the alien priory of Cranfield in Essex, the grant of which he had obtained from the crown, in the time of Edward IV.; to the church of Canterbury, he gave a fine image of the Trinity, of solid gold, adorned with precious stones, and a complete set of facerdotal vestments; to his successor, he left 2000l. in recompence for dilapidations; to the church of Worcester, he gave an image of the Virgin Mary, of gilt silver, estimated at the value of 61l.; to the church of Ely, 200 marks for repairing the fleeple; and to each of the universities, he bequeathed about 125l. each, which he ordered to be kept in chells, for the support of poor scholars. The chaff at Cambridge, which was united with Billington's, fulfilled in 1601, when 100l. was borrowed out of it, for the use of the university: but this fund was afterwards embezzled, through the iniquity of the times. The archbishop also left legacies to several monasteries.

Bourchier had the honour of performing the marriage ceremony between Henry VII. and the daughter of Edward IV. Thus, as Dr. Fuller observes, "his hand still held that sweet poise, wherein the white and red roses were tied together." He died at his palace of Knowle in 1486, and was buried on the north side of the choir, by the high altar, in a tomb of marble, round the verge of which is an inscription in old text characters. To the learning of this prelate, the testimonies are very equivocal; no record of it remaining, if we except some synodical decrees, an inquiry into heresies, and a few letters, inscriptions, and addresses to his clergy, which appear to have been merely official. The act that does the greatest honour to his memory, and indeed the only one that claims our particular notice, was his introduction of the art of printing into England. Having been informed, that the inventor, Johann, alias John Gutenberg, had set up a press at Haerlem, he persuaded king Henry VI. to commission Robert Tournier, a gentleman of his wardrobe, to go over privately to Haerlem. This person was furnished with 1000 marks, of which the archbishop contributed 300, and accompanied by Caxton, a merchant of London, embarked for Holland. Concealing both his name and business, he went first to Amsterdam, then to Leyden, and to batsett at Haerlem. After spending much time and money, he at length perfumed Frederic Corfield, one of the compositors, to carry off a set of letters, and to embark with him in the night for London. Upon their arrival, Corfield was sent down to Oxford, and secured from escaping, before the secret was thoroughly divulged, by setting a guard upon the press. Thus, it is said, the mystery of printing appeared ten years sooner in the university of Oxford, than at any other place in Europe, Haarlem and Mentz excepted. Not long after, presses were set up at Westminster, St. Alban's, Worcester, and other monasteries of note. If this account be just, printing was introduced into England, by the care of archbishop Bourchier, in 1464, the third year of king Edward IV. See Printing. Biog. Brit.

BOURDALOUE. Lewis, a celebrated preacher and reformer of pulpit eloquence in France, was born at Bourges in 1632, and entered at an early age, into the society of Jesuits. Having distinguished himself by his proficiency in the studies immediately connected with his profession, and more particularly by his talents for the pulpit, the society determined to assign him the office of a preacher. The reputation which he acquired in the country, induced his superiors to send him to Paris in 1669, where his fame increased, and recommended him to the court; so that he preached before Louis XIV., in the advent of 1670. He continued, for many years, the favourite preacher of the king, though he occasionally animadverted on his personal faults. Upon the revocation of the edict of Nantes, he was appointed by the court, to preach the catholic doctrine to the new converts in Languedoc. His talents were peculiarly adapted to this mission, as he was serious and imperious, and, at the same time, mild and insinuating, and capable of accommodating his addresses to persons of every rank and condition. With respect to the style of his eloquence, M. d'Alcambert, in his "Elloge de Malpillon," represents it as solid and serious, and, above all, strictly logical. Compared with Malpillon, he is said to have been the belle reafloner, and the latter the mod pathetique. It re sounded much to the honour of Bourdaloue, that he had, in a great degree, the merit of an original; the pulpit, when he appeared, "rivalled the theatre in buffoonery, and the schools in dryness." Towards the close of his life, he devoted himself to the service of the hospitals, the prisons, and the poor, and to other offices of charity. His conduct, which was exempt from that laxity of morals that was charged on his fraternity, afforded the belles refutations of the "Provincial Letters." He died in the midst of his pious and benevolent labours, in 1704. His discourses and other religious tracts have been published in two editions, one of 16 vols. 8to, and the other of 18 vols. 12mo. The first is the most esteemed. Novv. Dict. Hill.

BOURDEAUX, or Bordeaux, in Geography, a city and sea-port of France, and capital of the department of the Gironde, including 6 cantons, which contain 112,344 inhabitants, and comprehending 925 kilometres, and one commune. Bourdeaux is seated on the well bank of the river Garonne, about 40 miles from its mouth; and, before the revolution, it was the capital of the province of Guyenne, and one of the most prosperous and flourishing cities of France, but, in consequence of that event, its commerce has suffered much injury. The tide flows quite up to the city; its port is ample and commodious, and ships of considerable burden may load and unload at its quays. It was not unfrequent to see 5000 or 6000 vessels in the harbour at the same time. Its traffic with the West Indies is filled with sugar, cotton, indigo, and other manufactures; its chief exports are wine and brandy, and particularly the via de Bordeaux, which are denominated claret, together with vinegar, fruit, refined paper, honey, cork, &c.; and its imports were woollen stuffs, tin, copper, enameled hangings, leather, salted beef, tallow, druggs, deals, masts for
ships, hemp, pitch and tar. The whale and cod fishery, likewise, formed a considerable branch of the commerce of this city. It had 3 forts, the principal of which is that called "Trumpette," fortified by M. de Vauban, and commanding the harbour. The figure of this city is a kind of half moon; and it consists of 3 foymbours, viz. that of "Chapeau-rouge," that of "St. Surin," and that of "Chartrons," which last is remarkable for its extent, and the beauty of its buildings. Its university was founded in 1441; its academy of sciences and belles lettres was established in 1712, by which belongs a large library; its cathedral is an immense Gothic structure; and its hospital, built without the walls, accommodates a variety of manufactures. The "Place Royale," in the faubourg of "Chapeau-rouge," is adorned with several magnificent buildings, and an equestrian statue of Louis XV. in bronze, erected in 1743. Its theatre is the most magnificent in France, and the actors used to receive extravagant salaries; and as much as London exceeds Paris, so much did Bordeaux, before the revolution, transcend Liverpool. This city has many vennels of Roman art and grandeur; such as the tower-gate, said to have been constructed in the time of Augustus; the amphitheatre, which formed an oval of 227 feet long and 140 feet wide; the palace of Gallienus, of which remain only some walls, and the 2 gates at the entrance; a temple consecrated to the tutelary deities, whose columns surmounted in elevation the finest buildings of the city, and which inlaid almost entire, till the year 1700, when Louis XIV. demolished it, in order to extend the esplanade of the Trompette castle; the fountain of Aubege, celebrated by Aufonius, and furnishing the city with water, &c. The temperature of Bordeaux, upon a mean of 5 years, from 1777 to 1781, was 56° 8'. and the standard temperature of this latitude is 57° 6'. See Kirwan's Climate, &c. p. 87. N. lat. 44° 50' 18'. W. long. 3° 34' 49'.

Bordeaux, a town of France, in the department of the Drome, and chief place of a canton, in the district of Die; the town contains 1181, and the canton 4885 inhabitants. The territory comprehends 1326 square kilometres, and 9 communes.

BOURDEILLES, a town of France, in the department of the Dordogne, 34 leagues N. W. of Perigueux.

BOURDEILLES, Peter de, in Biography, more generally known by the name of Brantome, of which he was abbot, was born of an ancient family of Guivern, in 1527. From his early youth, he devoted himself to the fervile offices of a sinner, without deriving any substantial advantage from the character he assumed, and the adventures in which he was engaged. Although he obtained the honorary dignities of knight of the order of Malta, gentleman of the chamber to the kings, Charles IX. and Henry III., chamberlain to the duke of Alençon, and baron of Richemont in Perigord, he complains of indigence at the approach of old age. He died in 1614, at the age of 87. His memoirs, which have furnished anecdotes and biographical narrations, relative to the time in which he lived, were printed in 10 vols. 12mo.; and the last edition at the Hague in 1741, to which is annexed a supplement, is extended to 15 volumes. These memoirs abound with indecencies and contradictions; and though the anecdotes he has recorded, throw considerable light on the biography and history of the times, his own opinions and observations are entitled to little deference. Brantome, however, is an amusing writer, and his memoirs have had many readers. Nouv. Dict. Hitt.

BOURDEILLES, Claude de, the nephew of the preceding, and comte de Montefro, attached himself to Gaf-
BOU

was a painter on glass. He afterwards studied at Paris, under an artist of no great note, and at the age of 18 years went to Italy, where he very successfully imitated the style of different masters, as Claude Lorrain, Andrea Sacchi, Correggio, and Bamboccio. After his return into his own country, he painted, at the age of 25, his most famous picture, "The creation of St. Peter, in the church of Notre Dame at Paris." But being by religious profusion a Calvinist, he was interrupted in the exercise of his profession by the civil wars; and therefore, in 1652, he removed to Sweden, where queen Christina made him her chief painter. There he had an opportunity of exhibiting a singular display of his different talents. Gustavus Adolphus, the father of Christina, had brought some pictures from the pillage of Prague, which had never been unpacked. Christina employed Bourdon to examine these; and upon his making a favourable report of them, especially those of Correggio, the queen presented him with the whole collection. Bourdon declined accepting them, and informed the queen, that they were some of the finest pieces in Europe, and that he ought not to part with them; accordingly Christina, after his abdication, took them with her to Rome, and made them the basis of a collection, which afterwards came into the possession of the regent duke of Orleans.

After Christina's abdication, Bourdon returned to France, and pursued the exercise of his profession with uncommon fidelity; confining himself frequently to his garret, which was his painting-room, for a month together. He painted in a great variety of styles, and succeeded in all; history, portrait, landscape, pastoral, and grotesque. His chief faults, says Mr. Strutt, are want of force in the colouring, though others ascribe to it great force and effect, and of correctness in the outline; but these were amply overbalanced by the beauties of his composition, the lively fertility of his imagination, the animation of his expressions, and the variety and gracefulness of his attitudes. His virgins in particular are much esteemed; and the bust of his pieces are those that the least admired. Bourdon was one of the twelve persons who, in 1648, commenced the establishment of the Royal Academy, of which he became director. A violent fever terminated his life in 1674, much to the regret of all who highly respected his character as well as genius. Some of his daughters painted in miniature, and some of his scholars became eminent. His principal works are in the churches at Paris, in the gallery of the hotel des-Denonville, at Versailles, Montpellier, and Toulouse. His etchings, which are numerous, are executed in a bold, masterly style; and convey a clear idea of his manner of painting. The lights are broad, the draperies are formed with great taste, and the folds well marked, though sometimes too dark and hard upon the lights; the heads are very expressive; the back-grounds are finely conceived, and executed in a grand style. This master's etchings are held in the highest estimation, of which some of the principal from his own compositions are the following; viz. the "Seven Acts of mercy;" the "Flight into Egypt;" and the "Return from thence;" several subjects of the Virgin and child; in one of which is seen a woman walking linen, hence distinguished by the name of the "waller-woman;" the "Return of the ark," said to be very scarce; the baptism of the eunch; "Twelve large landscapes," very spirited and fine prints. D'Argenville. Pilkington. Strutt.

BOURDON, Alexel, a physician of Cambrai, published, towards the end of the 17th century, "Nouvelles tables anatomiques, ou font représentées toutes les parties du corps humain," large folio, Paris, 1678. Some of the tables are by the author; more from Vesalius. The plates represent-

the index, and chief place of a canton, in the district of Chateauneuf, and 1 mile N. of it.

Bougé-Loisy, a town of France in the department of Paye-de-Doubs, and chief place of a canton, in the district of Clermont, and 8 leagues W. S. W. of it. The town contains 2155, and the canton 57,879 inhabitants ; the extent of the territory comprehends 215 kilometres, and 10 communes.

Bougre de Lésées, a town of France, in the department of the Ardèche; 6 leagues N. N. W. of Privas.

Bougre-Martrix, a town of Savoy, in the department of Mont Blanc, and chief place of a canton, in the district of Montiers; the town contains 1668, and the canton 11,178 inhabitants; and the territory includes 967½ kilometres, and 13 communes.

Bougre Neuf, a sea-port town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Paimboeuf, seated on the English channel, at the mouth of the Loire, in a bay which it gives name, between the isle of Noirmoutier and the continent. It has a fine bay and harbour; and trades chiefly in fish, made from salt marshes in its vicinity; 61 leagues S. W. of Nantes, and 2 W. N. W. of Machecoul. It contains 2073 inhabitants, and the population of the canton includes 5501; the territory comprehends 185½ kilometres, and 6 communes.

Bougue d'Ogues, a town of France, in the department of the Ière, and chief place of a canton, in the district of Grenoble, and 5 leagues E. S. of it. The town contains 2079, and the canton 12,088 inhabitants; and the territory includes 910 kilometres, and 21 communes.

Bougre de Périgue, or de Valence, a town of France, in the department of the Drôme, and chief place of a canton, in the district of Valence, 1 mile N. of it. The town contains 2339, and the canton 13,113 inhabitants; the territory includes 225 kilometres, and 14 communes.

Bougre le Re, a town of France, and principal place of a district in the department of Paris, and 4 miles S. of it.

Bougre le Roy, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Frenay-le-vic; 2 leagues S. of Alençon.

Bougre de Fias, a town of France, in the department of the Lot, and chief place of a canton, in the district of Montauban, 8 miles W. of Lauzerte. The town contains 684, and the canton 17,770 inhabitants; the territory comprehends 330 kilometres, and 11 communes.

BOURGACHARD, a town of France, in the department of the Eure, and chief place of a canton, in the district of Touy-Auverme, and 4 leagues E. of it.

BOURGANEUF, a town of France, and principal place of a district, in the department of the Creuse, 5 leagues W. of Aubusson.

BOURG DUN, Le, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Dieppe, and 3 leagues S. W. of it.

BOURGOIS, Louis, also called Bouvier, in Biography, an experienced and intelligent midwife, in great repute, the latter part of the 17th and the beginning of the 18th centuries. Her husband was an army surgeon, as she informs us, and had been educated under Ambroise Paré; from him she received instruction in the more difficult parts of the art, so that she was enabled to deliver in some cases, where the assistance of the surgeon was usually thought necessary. In one case she extracted a stone from the urinary bladder, by means of the forceps. It is no wonder, therefore, that she attained to the height of her profession, and should be employed by the ladies of the highest rank, and at length by the queen of France, whom she de-

This was followed by a second and a third part, containing together, a collection of useful facts and observations on every branch of midwifery. "Receuil des faits," &c. 1635, 8vo, containing formulae for the composition of a great variety of medicines, for the cure of diseases incident principally to women and children, in which she appears to have had great skill; also for preparing cosmetics, for improving the complexion. "Recueil véritable de la maison des enfants, et donnes, les enfants de France," containing a register of the births of the children of the queen, with the circumstances attending the labours. It appears that the present made her on the birth of each of the royal infants was, 500 crowns for a male, and 300 for a female child. She had also a pension of 300 crowns per annum, which she was to enjoy during her life. "Instruction a ma fille," Paris, 1644, containing rules for her conduct in practice. These several treaties were collected together and published in 1652, Paris, 12mo. The volume is decorated with portraits of the queen of France, to whom it was dedicated, and of mad. Bourgier. It is also accompanied with copies of verbs to the king's physicians, and to mad. B. Haller Bib. Chur. Med.

BOURGER Mestre. See BOURGER Mestre.

BOURGES, in Geography, an ancient city of France, formerly called Amuricum and Sinjurges, the capital of the department of the Cher, situated at the confluence of the Auron and Eure. Before the revolution it was the see of an archbishop; its university was founded in 1406, by Lewis XI., who was born here, and invested the town with considerable privileges. The college of the Jesuits was a large and magnificent building. It contained 16 parish churches, and many public buildings. The cathedral church is considered as one of the most beautiful Gothic edifices in Europe. The principal manufactures of this place are linen cloth, woollen fluffs, and cloyings, which are sold at its annual fairs; and also its commerce is small. The town contains 15,349, and the district the same number of inhabitants; the territory includes 90 kilometres, and 1 commune. N. lat. 47° 0' 4", E. long. 1° 23' 26".

BOURGÉS, a small town of Savoy, seated on a lake of the same name, about 10 miles long, and from 2 to 3 wide, 6 miles N. of Chamberby. This lake has a fifth unknown in other countries, called "Lavatere," which weighs four or five pounds, and is much valued at Chamberby. Near this lake is an irregular reciprocating spring, which issues from a rock, and is called "La Fontaine de Mer-veille."

BOURGET, Le, a town of France, in the department of Paris; 2 leagues N. of it.

BOURGEOIS, de la Forest, Le, a town of France, in the department of the Mayenne; 3 leagues N. W. of Laval.

BOURGOGNE, a town of France, in the department of the Marne, and chief place of a canton, in the district of Reims, and 5 miles N. of it. The town contains 631, and the canton 11,089 inhabitants; the territory includes 275 kilometres, and 25 communes.

BOURGOING, a town of France, in the department of the Ière, and chief place of a canton, in the district of la Côte-du-Pin, and 2 leagues W. of it. The population of the town includes 3595 persons, and that of the canton 15,062; the territory comprehends 175 kilometres, and 11 communes.

BOURGHEROUDE, a town of France, in the department of the Eure, and chief place of a canton, in the district

BOURGUIET, a town of France, in the department of Calvados, and chief place of a canton, in the district of Caen; containing 405 inhabitants; the population of the canton is 9,391; and the extent of the territory comprehends 1473 kilometres, and 30 communes.

BOURGUEIL, a town of France, in the department of Indre and Loire, and chief place of a canton, in the district of Chinon: 7½ leagues W. of Tours. The town contains 2813, and the canton 14,969 inhabitants; the territory includes 1424 kilometres, and 7 communes.

BOURGUES, E. w. 1713, in Biography, was born at Nimes in 1688, and removing with his family, who were protestants, to Switzerland, on the revocation of the edict of Nantes, he pursued his studies at Zurich. Here he distinguished himself by his application to theology, the languages, mathematics, law, antiquities, medals, and more particularly natural history. His attention was more especially directed to geology, for the cultivation of which his situation among the Swiss mountains was peculiarly favourable. He afterwards settled at Neuchatel, and here became professor of philosophy and mathematics. In 1729 he printed, in French, "Philosophical letters on the formation of falls and cataracts, and on the generation and organic mechanism of plants and animals," &c. 12mo. In the preceding year he had undertaken, with the affiancement of learned colleagues, a periodical work, entitled "Bibliothèque Italique," printed at Geneva, and extended to 10 vols. 8vo. which was esteemed a judicious and useful performance. Bourges had many literary connections, and was a member of several learned societies. Many of his papers were published in the "Journal Helvétique." He died in 1742. Moreni.

BOURGUI NOTTE, a defensive weapon wherewith to cover the head; being a kind of calk, open before, and proof against either pike or musket; its name arose from the Bourguignons, who first introduced it.

BOURGUIGNONS. See Burgundians.

BOURI, in Ichthyology, the Arabic name of Mugil cephalus, Linn.

BOURJON, Antoinette de la Porte, in Biography, an enthusiast of a wild imagination and turbulent disposition, was born at Lisle in Flanders, in 1616. Under a pretense of a divine inspiration and commissiou, she engaged in reviving the true spirit of Chrillianity, which she represented as extinguished by theological anomalies and debates. Her own temper, however, was very different from that truly Christian spirit which she professed to reanimate. Adverse to marriage, though urged to it by her family, which was opulent, she eloped in order to avoid their persuasions; and, after a variety of adventures, became governness of a hospital in her native town, and assumed the order and habit of St. Agustin. Here, however, her relietl and overbearing temper occasioned such disturbances, her, in consequence of the interference of the magistrates, she was obliged to remove to Ghent. One of her converts, named Chriillian Bartholomew de Cord, who had been a Jesuit and priest of the oratory at Mechlin, was owner of part of an island in Holleten, called Noordbrandt. Of this patron of her fanaticism bought an estate in this island, and determined to settle there with her dependants. In the mean while she resided at Amsterdam, and made many profelytes. She also wrote several books, and particularly one, entitled, "The Light of the World," in which she professes to explain her mystical principles. Mollheim suggests, that an attentive reader of her works will perceive, that her intellect must have been in a disordered state; that molt of her divine effusions were borrowed from the productions of the Mystics; and that, by the intemperance of her imagination, she has given an additional air of absurdity and extravagance to the tenets which she had derived from those pompous entusiasms. The predominant principle of her works is this: "that the Christian religion conflicts neither in knowledge nor practice, but in a certain internal feeling and divine impulse, that arises immediately from communion with the Deity." Upon the death of De Cordt, who made this female fanatic his heiress, she left Holland in 1671, with a view of settling at Noordbrandt; but the discouraged many of her disciples from attending her; under an apprehension that their attachment was selfish, and that they wished to obtain a sublimation at her expense. She wrote in French, Dutch, and German, with great facility; and printed her numerous works in a press, which she had set up in her own house. Such, however, were both her principles and temper, and that she exposed her to a variety of persecutions, which disquieted her mind, and made it necessary for her frequently to change her abode. At length she obtained the direction of an hospital in East Friesland, where her time was devoted to the service of the poor, whilst she retained her money under a notion, that the could find none that were devoting objects of her bounty. After a life of vicissitude and vexation, and suffering many insults on account of her religious fancies, she ended her days at Franeker, in 1688. Whilst she lived her followers were few in number; but after her death, her writings were the means of multiplying her profelytes, who were distinguished by the appellation of "Bourjonnits." Amongst these a Cartesian, of a bold and penetrating genius, whose name was Peter Poiret, took the lead; and he drest out in an artful manner, and reduced to a kind of system, the wild and incoherent fancies of Bourjon, in a large work, entitled, "L'Oeconomie Divine, ou Système Univerfield," which was published, both in French and Latin, at Amsterdam, in 1686, in 7 vols. 8vo. In Scotland her notions occasioned a controversy, in which Dr. Cockburn distinguished himself as the opponent of the Bourjonnists. Gen. Dict. Moh. Eccl. Hist. vol. n. p. 514, &c. 8vo.

BOURMONT; in Geography, a town of France, in the department of the Upper Marne, and chief place of a canton, in the district of Chaumont, and 6 leagues E.N.E. from it, seated on a steep mountain; the population of the town is estimated at 1071, and of the canton at 10,370; the territory includes 27½ kilometres, and 26 communes. N. lat. 48° 12'. E. long. 5° 32'.

BOURNE, a market town of Lincolnshire, in England, stands on the southern side of the county, near the borders of Rutlandshire, at the distance of 97 miles north from London. Here have been a castle and a priory, but both are partly destroyed. The outworks, ditches, and some fragments of the former are left to commemorate the spot; and as the fortified area includes about eight acres of land, we may presume that it was a place of considerable strength and importance. "Very large irregular wars," says Mr. Gough, "are on the north and west sides between the two ditches; the earth raised about 20 yards in length, and 10 in breadth, and a ditch between every one of these pointing to the grand mast." These works are said to have been formed by Oliver Cromwell, when he attacked the town. Some of our ancient historians have stated that S. Edmund, king of the East Angles, was crowned at Bourne; but this is contested by Mr. Gough, who places the scene of that event at Bures in Suffolk; indeed this castle does not appear to be connected with any public event till the time of the Danish invasions.
invasions. Some of these marauders' having made an inroad into Lincolnshire, Marcelet, lord of Bourn, with his numerous family and attendants trained in arms, and about 250 men from Croyland abbey, marched against them, and met them at Laundon, where a desperate battle ensued, which terminated in favour of Marcelet and his party. Bourn, as its name implies, is situated in a valley, and has a stream running through part of it, which turns three mills, very near its source. Here is also a medicinal mineral spring, of which the waters are rather brackish, and are found to be serviceable in some disorders. Here are some tanneries, and one parish church, a chapel, and two alms-houses. The markets are weekly on Saturdays, and here are three annual fairs. Vellies of about ten bulls burthen convey articles of commerce, &c. from this place to Spalding, Boston, &c.

That distinguished statesman, Sir W. Cecil, who was created baron Burghley, by queen Elizabeth, was born here in 1521, and poecifed this manor. At an inn in this town was formerly a curious old portrait of queen Elizabeth, on a panel. The town-hall was built by the above nobleman. The township contains 582 houses, and 1474 inhabitants.

At Stanefield, a village a little to the north, is a chalybeate spring, and, according to Dr. Stukeley, many Roman coins have been found here. About four miles hence is Grimthorpe, a seat belonging to the duke of Ancaster. The house, a magnificent structure, stands on a hill in the midst of a large park, which, with its fine woods, and large piece of water, confitute many grand and beautiful scenes. "Grimthorpe," says Fuller, "I may call an extemporary structure, got up on a sudden by Charles Brandon, duke of Suffolk, to entertain king Henry VIII. in his progress to these parts." Since the period of Fuller's writing, this house has undergone many improving alterations, and is now finished and fitted up in an elegant style. Gough's edition of Cambden's Britannia, vol. ii. Fuller's Church History of England.

BOURNASSEL, a town of France, in the department of the Aveyron, 44 leagues N.W. of Rhodiez.

BOURNEVILLE, a town of France, in the department of the Eure; 2 leagues N.W. of Pont Amander.

BOURNEZEAU, a town of France, in the department of the Vendee; 5 leagues N.W. of Fontenay le Comte.

BOURNIQUEL, a town of France in the department of the Lot, and chief place of a caution, in the district of Montauban, seated on the south side of the Aveyron; 13 miles E. N. E. of Montauban.

BOURNOU. See Bournou.

Bourou. Great and Little, two capes at the commencement of the road in the gulf of Salonicia. This road, which terminates at a shoal, which is situated at the head of the gulf, affords good anchorages to ships of every size, and a safe retreat to fleets.

BOURO, one of the Moluccas or Spice islands in the East Indies, lying between Cerem on the east, and Celebes on the west; its shape is oval, the longest diameter extending east and west; about 90 miles in length by 50 in breadth. This isle was nominally subject to the king of Ternat; but in 1666 the Dutch built a fort in the bay of Cagele, or Cayjcl, at the north east end of the island, where the natives who profess the Mahometan religion have a mosque, whole roofs, gradually sliding in a regular gradation one above another, present a very agreeable appearance; and though they burned the exterior woods, they seem to have improved the industry of the inhabitants. This island rises suddenly from a deep sea, being encompassed as with a wall. Part of its northern coast is inhabited by a people who are subjects of the Dutch company, and are governed by their "Ora-cayos," who have each a "dop," or deputy under them. The interior parts, which confit of mountains lofty, that they may be sometimes defied at the distance of 28 leagues, are the haunts of the "Alfores," or wild mountaineers. The fourth coast is now defiled, on account of the continual invasions of the Papuas. The coast, to the east of the village of Cayjcl, is watered by a number of small streams; but to the north-west there is a very considerable river, called by the natives "Aer-Beell," which discharges itself into the road-lead. This river is very deep, and for some distance from its mouth more than 50 feet broad. On its borders is found the beautiful shrub, known by the name of "Portlandia grandiflora." The poodles rolled from the mountains by the rivulets are fragments of "quartz," mixed with mica. Birds, especially parrots, are innumerable, that the island probably derives from this circumstance its name, which signifies, in the Malayan language, a bird. The woods afford abundance of deer, goats, and wild boars. The civet weasel is found in this island, and the curious hog called babirouffas. A green ebony, and a kind of iron wood, are mentioned among the trees, and several other kinds of wood, proper for inlaid work, much valued by the Chineses, and others for dying; and it is not improbable that the clove, and perhaps the nutmeg, defy, in the recesses of the mountains, the wild avarice of man. The figo tree grows here in great abundance, supplying the inhabitants with the principal means of their subsistence, as well as an article of exportation. The "Cayou pouti," of the Malays (Melaleuca laetifolia) grows in great abundance upon the hills; and from this is obtained, by distillation, a great quantity of the oil of cajeput. According to astronomical obervations, made by those who pursued the voyage in search of la Perouse, at the village of Cayjcl, its latitude was 3° 21' 54" S. and longitude 137° 21' 0" E. The dip of the magnetic needle was 20° 30'. Its variation, observed on board, was 0° 54'. The highest point indicated by the thermometer (Reaumer's) on board was 23°, and on shore 25° 58°. The mercury in the barometer varied only from 28 inches 1 line to 26 inches 2 lines. The time of high water on the full and change days was three quarters after twelve; it then rose to the perpendicular height of 6 feet. Voyages in search of la Perouse, drawn up by M. Labillardiere, vol. ii. p. 308, &c. Eng. ed.

BOURO, is also a small island, north of the island of Sumatra; 5 leagues N.E. of Acheen.

BOURON, a town of European Turkey, in Romania, the see of a Greek bishop, seated on a lake of the same name, and 15 miles distant from the coast of Archipelago.

BOURRE, in Ornithology. According to Salerne, the common or domestic duck is called boure in Normandy, and the ducklings bouret.

BOURRE, in Zoology, is also a word in use in France to express the hair of several quadrupeds, such as the ox, the buffalo, the horse, flag, &e. Thus also they have the designation of boure de corps for the woolly kinds, and boure de force for that of a silky texture.

BOURREE', F. the air of a dance so called, is supposed to come from Auvergne, in which province it is still in use. The tune is in common time, and begins with an odd crotchet. Rouleau.

BOURKERIA, in Botany. See Ehetria.

BOURRIQUE, in Zoology, synonymous with l'antifer, the hnc-afs.

BOURSAULT, EDMNE, in Biography, a French dramatic writer, was born in the province of Burgundy, in 1638; and by lingual affinity, though his education was
altogether neglected in his youth, attained a very accurate acquaintance with the French language. After his settlement at Paris, he was employed by M. the Capucin, in composing a work for the Dauphin, entitled "The true Study of Sovereignty," which was so well received, that the author would have been appointed a prior to the Dauphin, if he had understood Latin. For a weekly gazette in verse, with which he amused the court, he obtained a pension; but, on account of an immoral attack upon the Capucin, a complaint was lodged against him by the queen's Spaniard confessor, who belonged to that order, and in consequence of it his gazette and pension were suppressed, and he himself was in danger of being confined in the Bastile. In a similar gazette he afterwards introduced a satire on the prince of Orange, which political considerations induced the court to suppress. At length, however, he was appointed receiver of the tithes at Montéron, where he died in 1701. As a writer for the stage, Bourault was distinguished by his talents for agreeable ridicule, united with good sense, and also by an harmonious verification, as well as a style that was easy and adapted to its subjects. His "Éloge à la Ville," and "Éloge à la Cour" still retain their reputation on the theatre. An attack upon Boulain, by way of retaliation for some personal reflections in this author's satires, prevented the introduction of his piece in one act, entitled "La Satyre des Satyres," on the stage; but it was afterwards printed with a preface. Some years afterwards, Bourault, by his polite attention to Boulain, conciliated his friendship, and induced him to infuse some other name terminating with ode, in his satires. Bourault also wrote tragedies and operas; and his dramatic works were published in 1746, under the title of "Théâtre de Bourault," in 3 vols. 12mo. His letters, miscellaneous pieces, and romances, are now forgotten. Nouv. Dict. Hist.

BOURSE, in Ichthyology, in the fishes of France and Madagascar, the common name of all the fishes of the Téronon genus. In the French American colonies, baliste casta (balistes recta) bears the same name. Lacépède like- wise alludes the word bourse as a specific name to a new species of balistes deforced by Sonnerat, the first dorsal fin of which has three rays; the second is pointed; tail forked; and below the eye a black banded spot.

BOURSIER, Lawrence-Francis, in Biography, an eminent theologian and metaphysician, was born at Ecouen, in the diocese of Paris, in 1679, and entered into the Sorbonne in 1700, where, in 1711, he obtained the degree of doctor. As he devoted himself to study, he received several benefits which were offered to him; and, at the age of 31, acquired great celebrity, both as an eloquent writer, and profound reasoner, by a work entitled "The Action of God on the Creatures," or "Physical Promotion proved by reasoning," 2 vols. 4to, and 6 vols. 12mo. This work was highly extolled by the Jansenists; and Voltaire speaks of it (Age of Lewis XIV.), as deeply argued for, learned, and sometimes extremely eloquent. It involved him in a controversy with the famous Malebranche. He was also the author of a memoir presented to Peter the Great by the doctors of the Sorbonne, concerning a proposed union between the Russian and the Latin churches, which originated from a conference held by the author with the czar, on his visit to the Sorbonne. His other works, which were numerous, chiefly related to the disputes that subsisted in the Gallican church. In 1729, he was one of many doctors who were expelled the Sorbonne; and from this time he was under a necessity of securing his personal liberty by living in privacy. He died at Paris, in 1749. Nouv. Dict. Hist.

BOURSIERS, in Entomology, the cantver latro. Rochef.

BOURTOFT, in Geography, a town and fortress of Glemggen; 12 miles S.S.W. of Windhotten.

BOURTH, a town of France, in the department of the Eure; 2 leagues N.W. of Vernon.

BOURTHES, a town of France, in the department of the Straths of Calais, and chief place of a canton, in the district of Boulogne; 4 leagues S.E. of Boulogne.

BOURTY, or Botry, a village of Africa, in the kingdom of Ania, on the Gold coast, seated on a small river, at the foot of an escarpment, on which the Dutch have built an irregular and mean fort, of an oblong form, divided into two parts, each defended by four small pieces of cannon. The fort was built by one Carolus, in the service of the Dutch, who afterwards passed into the pay of France, and obtained that privilege from the king of Ania, an acknowledgment of his superiority by a flight tribute. This fort is called Badenlyn; its batteries command the village of Bourty, which has no other commerce besides the gold trade carried on with the negroes of Adom. The inhabitants are of a mild and gentle disposition, much attached to the Europeans, whom they consider as their protectors. In 1768, the Dutch concerted a plan for forming sugar-plantations, which alarmed Sir Dalby Thomas, and the English governor at cape Coast, who represented to the Royal African company the danger of permitting the Dutch to execute a scheme, which would diminish the value of the British colonies in the West Indies. These sugar-plantations, the plan of which was thus counteracted, never answered the great expectations of the Dutch.

BOURY, in Zoology, a species of ox, that inhabits Madagascar. It is of the size of a camel, of a hufy white colour, and, like that animal, has a protuberance on the back. Boury is the name by which this kind is called by the natives.

BOUSCH, or Bouch, in Geography, a town of Upper Egypt, situate about a quarter of a league from the west bank of the Nile, and 4 miles N.E. of Beniolen. The houses are built of brick, and the roofs are elevated in the form of pigeon-houses. The inhabitants occupy the ground-floor, and the pigeons the first, a practice which is general through the rest of the Iubai. These houses, which make some figure at a distance, exhibit on entering them only tokens of wretchedness in the midst of an abundantly rich country. In this town is occasionally held a considerable market for cattle and provisions. The canal of Bousch formerly poured its waters into the river for six months of the year. At present it conveys them through the whole year into the lake Moeris, which does not receive a sufficient quantity by Joseph's canal, half choked up as it is, to admit of its overflowing any to the Nile.

BOUSIER, of the French Entomologists. See Corbis.

BOUSK, in Geography, a river of Peru, which discharges itself into the Peruvian gulf, near Border Hik.

BOUSSE, a town of France, and principal place of a district, in the department of the Creuse, 6 leagues N.E. of Guéret. The place contains 586, and the canton 757 inhabited; the territory includes 3394 kilomètres, and 17 communes.

BOUSSANGERS, a town of France, in the department of the Herault; 6 leagues N. of Béziers.

BOUSSEIRE, a town of France, in the department of the Doubs, and chief place of a canton, in the district of Berno; the town contains 547, and the canton 795 inhabitants; the territory comprises 155 kilomètres, and 25 communes.

BOUSU,
BOUSSU, a town of France, in the department of Jemappes, and chief place of a canton, in the district of Mons; the town contains 1832, and the canton 15,541 inhabitants; the territory includes 833 kilometres, and 14 communes.

BOUSTROPHEDON, common in ded of tow, bullets, and words. It is used in speaking of the ancient method of writing among the Greeks, wherein the lines were continued backwards and forwards, like the furrows in ploughing.

Pompeius (ib. c. 27) mentions several ancient inscriptions written in this manner; the laws of Solon are said to have been thus written; which, as the author last cited explains it, is when the second line is turned on the contrary side, beginning at the end of the former, thus:

EX AIOS AR

VORAX

Potter, Arch. Graec. lib. i. cap. 26. tom. i.

BOUT, in Ornithology. Under this name Buffon describes two birds of the Crotaphaga genus; namely C. act, as le petit bout de Peuc; and C. major, as le grand bout de Peuc.

BOUTA, in Ancient Geography, a town of Africa, in Libya Interios, near the source of the river Cinipha, according to Prokemem.

BOUTADE, in Myth, an irregular flight or movement without art or fancy. The word was also formally used for a solo on the violin di gamba, thus called as being supposed to be extemporary.

Richet speaks of a dance called boutade, invented by the famous Bocan, in the reign of Lewis XIII. it called from the brisk humorous manner of its beginning; but now out of use.

BOUTAIL, in Ichthyology, the local name of a certain kind of fish, that is used to inhabit the lakes, ponds, and fresh waters, in the East Indies, where it is also called the Neogen venen. Ray describes it under the name of lamaptara indica. It is conjectured that this must be long to the lamprey, or petromyzon genus, from the accounts of authors who speak of it; but whether really so, or not, it is difficult to determine.

BOUTAN, in Geography. See Boutan.

BOUTANT, in Architecture. An arc or buttress, serving to sustain a vault; and which is itself sustained by some strong wall, or massive pile.

The word is French, and comes from the verb buter, to butt, or but.

A pillar Boutant is a large chain or pile of stone, made to support a wall, terrace, or vault.

BOUTE, in the Marsi. A horse is called bute, when his legs are in a straight line from the knee to the quarter; short-jointed horses are most apt to be bute.

BOUKOUJA, in Geography, a town of Peris, in the province of Ghilain; 120 miles N.W. of Refad.

BOU ON, or BORON, one of the Molucca or rather Celebrian islands, in the Indian sea; situated about 13 miles to the south-east of Celebes. It is a large and woody island, and is a kingdom of itself, to which the neighbouring islands belong. The king of Bouton is in alliance with the Dutch company, who pay him a yearly sum of 150 rix-dollars, or 371. 14s. 6d. Reeling in new Dutch coin, upon condition, that he should not only permit the extirpation by the company of all the clove-trees in this and the neighbouring islands, but also assist him in effecting it. For this purpose, the company annually send out a serjeant, who is styled the "extirpator," and who goes through all the woods in the islands, and causts all the clove-trees which he meets with to be cut down. The king of Bouton is obliged to provide for him guides and interpreters, and also vessels, if he should need them. But as this contract has not been regularly fulfilled, the government in Java has thought proper to withdraw this pecuniary allowance, at least for one year, in order to induce this prince to adhere more rigidly to his contract, and to be more active in effecting the company to destroy this rich production in his country, for the benefit of Archipne and Batau. The passage between Bouton and the Tocuan-beffis is the second dangerous part of the navigation; for ships going to the Molucca or Spice islands; the other being that of the "Badgerons." The former channel is, indeed, wider than the latter, being about 4 leagues in breadth from the narrow port of Bouton to the westmost end of the Tocuan-beffis; but the danger is of longer duration, on account of the numerous small islands that form the cluster called the "Tocuan-beffis," all of which are either connected or surrounded by rocky shoals, over and between which very rapid currents set strongly to the northward; besides, a large and dangerous flat, called the "Hesivy," or horse-flat, lies one or two leagues out of them, upon which many vessels of the company have been wrecked. In the narrow part of the passage is a bay running into the land, wide and north, into which vessels are in danger of being driven by the currents which set to the bay, if the point opposite Tocuan-beffis be approached too near in calm weather. From this bay there is no escape till the west monsoon sets in again; and some of the company's ships have been under a necessity of remaining in it for one or two months. From this circumstance, the navigators have given it the name of "Dwuri," or Milakay-bay. The principal town of this island is Calafusbur, situated about a mile from the sea, on the top of a hill, and surrounded by walls. The inhabitants are small, but well-shaped, and of a dark olive complexion. Their huts are erected on piles; and their religion is Mahometan. Stavorinus's Voyages to the East Indies, vol. ii. p. 350. S. lat. 5° 15' E. long. 125° 35'.

Bouton de Camifolle, in Conchology, a trivial name in France for trochus labes of Linneus.

Bouton de la Chine, the Linnean trochaire niloticus.

Bouton de Rose, a species of Bulla, ornamented with red bands, bulla splifera of Linneus.

Bouton terrebre, the common name of a terrestrial snail, figured by D'Argenville. It is the helix reticulata of Linneus.

BOUTONNE, in Geography, a river of France, which runs into the Charente, or leagues E. of Rochefort; passing by St. Jean de Angely, and navigable to that town.

BOUTS-RIMES, a popular term in the French Poetry: signifying certain rhymes, disposed in order, and given to a poet, together with a subject, to be filled up with versc ending in the same words, and the same order. The invention of the bouts-rimes is owing to one Da Lot, a poet, in the year 1649. In fixing the bouts, it is usual to chuse such as form the remotest, and have the best connection.

Some good authors fancy, that these rhymes are of all others the easiest, that they afford the invention, and furnish more new thoughts than any others. Bannain has a poem on the defeat of the bouts-rimes. The academy of Letters, at Thoulouse, have contributed towards keeping in countenance the bouts-rimes, by proposing each year a set of fourteen, to be filled up on the glory of the grand monarque: the victorious sonnet to be rewarded with a fine medal. An instance hereof may be given in the following one, filled up by P. Comnart:

BOUAILLICK, in Ornithology, synonymous with ca-

zula, filipicus, which see.

BOUTTONNEE, Fr. in Heraldy, is applied to the seed

of a rose, when it is represented of a different colour from the

flower by which the English call seeded, e.g. a rose gules seeded.

BOUVERET, in Ornithology, the French name of loxia

aurantia.

BOUVERON. Under this name loxia sinae is de-

scribed by several French writers, Brillou, however, calls it

petit lovec rur d'afrique.

BOUVIER, the name of matametis sinew. Salern. On.

BOUVIERA, in Ichthyology, a name given by some

writers to a small fresh-water fish, found in the clear streams

of France and Germany, The French call it bourvire. It

also bears the name of lubula. This is cyprinus amanus of

naturalists.

BOUVIERE, the common name in France of cyprinus

amans.

BOUVIGNES, in Geography, a town of the Nether-

lands, in the county of Namur, feated on the Meuse. Near

Bouvignes, which was formerly surrounded with a wall, and

had a drum cable, are the remains of an ancient city, called

'Chieremouet,' the inhabitants of which committed many

depredations, and defended themselves with valour against

Charles the Simple in 922, against Otho in 939, and against

Bruno archbishop of Cologne, in 969. But it was at length

taken and destroyed, in 992, by Notger, bishop of Liége.

It is distant four leagues S. from Namur.

BOUVINES, or Pont-a-Bouvines, a village of Fland-

ders, feated on the river Marque, 3 leagues S.E. of Lille,

where Philip Augustus obtained a great victory over the

emperor Otho in 1214.

BOUVREUIL, in Ornithology (Buffon, &c.), loxia

fynhola of Linnaeus and other yfnicmeate writers; and

bull, of the English. Bouvreuil, in a more general sense,

implies all the birds of the Loxia genus.

BOUXIERES-AUX-DAMES, in Geography, a town of

France, in the department of the Marnthe, 1 league N. of

Nancy.

BOUXWILLER, a town of France, in the department of

the Lower Rhine, and chief place of a canton, in the dis-

trict of Savern; 6 leagues N.W. of Straugburg. The town

contains 2700, and the canton 12,264 inhabitants; the ter-

ritory includes 105 kilometres, and 21 communes.

BOUZANNE, a river of France, in the department of

Indre, which rises near Agurande, 7 leagues from Argent-

on, and discharges itself into the Creuse, near Clufem.

BOUZDOGAN, a town of Asiatic Turkey, in the pro-

vince of Natoila; 24 miles N.W. from Mogla.

BOUZE, a town of France, in the department of the

Cote d'Or, and chief place of a canton, in the district of

Beaune; 1 league N.W. from Beaune.

BOUZEK, a town of Asiatic Turkey, in the province

of Caramania; 32 miles E.N.E. of Kir-isch.

BOUZILLES, a town of France, in the department of

the Mayane and Loue; 1 league S.E. of Ancenis.

BOZULI, a town of France, in the department of

Vendée, and in the district of Montaigu; 5 miles south

of it.

BOZKIR, a town of Asiatic Turkey, in the province

of Natoila; 30 miles S.S.E. of Beihthri.

BOZOLS, a town of France, in the department of the

Upper Loire; 1 league S. of Puy-en-Velay.

BOZONVILLE, a town of France, in the depart-

ment of the Mofelle, and chief place of a canton, in the dis-

trict of Thionville, and 5 leagues S. of it, feated on the

Nied. The town contains 1400, and the canton 12,740

inhabitants; the territory comprehends 190 kilometres, and

40 communes.

BOW, Arrows, a weapon of offence, made of wood, horn,

or other elastic matter; which, after being strongly bent, by

means of a string fastened to its two ends, in returning to its

natural state, throws out an arrow with great force.

The bow is the most ancient, and the most universal of all

weapons: and has been found to obtain among the most

barbarous and remote people, who had the least com-

munication with the rest of mankind.

Its invention was ascribed by the ancients to Apollo, and

2 was said to have been first communicated to the primitive

inhabitants of Crete: Hence, even in latter ages the Cretan

bows were famous, and preferred by the Greeks to all

others. Some, however, rather chose to honour Perseus, the

son of Perseus, with the invention; while others ascribed it
to Scythes the son of Jupiter, and progenitor of the

Scythians, who were not only excellent at the bow, but by

many reputed the first masters of it. (Potter's Arch. Grec.

&c.) All these different tales, however, serve but to show that

its antiquity must be referred to the remotest periods of

history.

The earliest mention in the Old Testament, where the use

of the bow is implied, is in that remarkable passage where

Hagar and her son, driven from the houte of Abraham,

wander in the wildernefs of Beer-sheba. Of Ishmael it is

said (Gen. 21. 21), "And God was with the lad, and he
grew, and dwelt in the wildernefs, and became an archer."
The connection of which with the fifth preceding chapter

(xvi. 12.) implies an earlier practice with the bow than any

that can possibly be adduced from the profane historians.
The overthrow of Saul was particularly owing to the

Philistine archers. (1 Sam. xxxi. 3.) and (2 Sam. i. 18.)

We are told, who succeeded him, "bade them teach the

children of Isahah the use of the bow: behold it is written in the

book of Jasher."

The practice of the bow indeed, at this time, appears to

have been so general, that it was not unfrequently made use

of as a figure of speech. Israel, when bleeding his sons,

(Gen. xlix. 23, 24.) says of Joseph, "The archers have

gorely grieved him, and shot at him, and lashed him. But

his bow abode in strengthe, and the arms of his hands were

made strong, by the hands of the mighty God of Jacob."
The companies that came to David at Ziklag (1 Chron. xii. 2.)

were armed with bows, and could use both the right hand

and the left. Its earliest application was undoubtedly to the

purposes of food; and accordingly, when Isaac sent

Elau to the foreiff, he said, "Take, I pray thee, my

weapons, thy quiver, and thy bow, and go out to the field,

and take me some venison."

The fabulous writers of antiquity ascribe, that Teutars, a

Scythink, first gave Hercules a Scythink bow and arrows

(Lycoptron. Caffandria, v. 56;) and Theocrates mentions it

by the name of the Martian bow.

From the Scythians, it was derived to the Grecians, some

of whose ancient nobility were instructed by the Scythians

in its use, which in those days passed for a most princely

education (Potter, Arch. Græc. tom. ii. i. iii. cap. 4.

Aquin. Lcxi. Milit. ii. 260.) The Scythink was distingui-

ished
guished from the Grecian bow, as well as from that of every other nation, by the singular incurvation of its shape, which was so great as to form a half-moon or semicircle (Amin. Marcullius, l. x.); whence the shepherd, in Athenaeus, being to describe the letters in Thelaus's name, and expressing each of them by some apposite resemblance, compares the third to the Scythian bow, meaning not the more modern character of 2, but the ancient C, which is semi-circular, and bears the 3d place in octoïdēc. Among the ancients, the bow-string, called τιθος, was made of horse's hair, and thence called σαβρος; though Homer's bow-strings are frequently made of hides cut into small thongs; whence σαβρος, The uppermost part of the bow, to which the ftring was fastened, was called καρπος, being commonly made of gold, and the laft thing towards finishing the bow.

The Grecian bows were frequently beautified with gold or silver; whence we have mention of aureus arcus; and Apollo is called απόστοις. But the matter of which they were ordinarily composed, seems to have been wood; though they were so anciently, Scythian like, made of horn, as appears from that of Pandarsius in Homer (Iliad. ii. v. 103. Potter Arch. Grec. tom. ii. cap. 4.)

Till the second punic war the Romans had no bowmen in their armies, but such as came with their auxiliary forces. (See Potter, ut supra)

The bows of the Arabians, who attended Xerxes's expedition, were long, flexible, and crooked, (Herodotus Polymn. i. x.) The Bactrians also had their bows and arrows (Ibid. i. xiv.) and among the Indians they are still retained.

In drawing the bow, the primitive Grecians did not pull back their hand towards their right ear, according to the fashion of modern ages, and of the ancient Persians (Procopius de bello Perico, i. 11.) but, placing their bows directly before them, returned their hand upon the right breast (Enhathus, Iliad. 6. p. 344. &c.). This was likewise the custom of the Amazonian women, who are reported to have cut off their right breasts, lest they should prove an impediment in shooting.

The most barbarous nations often excel in the fabric of the particular things which they have the greatest necessity for, in the common offices of life. The Laplanders, who support themselves almost entirely by hunting, have long had an art of making bows, which they sell, in the improved parts of the world, have never arrived at.

Their bow is made of two pieces of tough and strong wood, shaved down to the same size, and flattened on each side; the two flat sides of the pieces are brought closely and evenly together, and then joined by means of a glue made of the scales of perch, which they have in great plenty, and of which they make a glue superior in strength to any which we have.

The two pieces, when once united in this manner, will never separate, and the bow is of much more force to expel the arrow, than it could possibly have been under the same dimensions, if made of only one piece.

Having thus traced the early history of the bow, and evinced its general use, we now come to its history as principally confined to England. The bows in use have been of two kinds; the common or long-bow, and the cross-bow: but as the Saxon bow appears to have differed from them both, our readers may not be displeased to read the description of it separate. Its particular use among the Anglo-Saxons and the Danes has already been mentioned: their skill, however, does not appear to have been extended beyond the purposes of procuring food or warfare: and the representation of a Saxon bow, as given in an ancient MS. of the tenth century, (MS. Cott. Claud. B. iv.) shews it was made very different from what one might expect in a military weapon; the string not being fastened to the extremities, but suffered to play at some distance from them. In size too it was a mere toy, compared with the long-bow of succeeding ages. (Strutt's Sports and Pastimes. p. 39.)

The history of the long-bow has been already detailed, under the head of Archery. We have here little else to add, than that a variety of acts of parliament, passed in different reigns, tended much to the encouragement of those who used it. In 1432 (12 Ed. iv. c. iii.) four bow-slaues were ordered to be imported, with every ten of merchandise, from Venice; and by other acts, passed in the first of Richard III. the sixt of Henry Vili. and the thirteth of Elizabeth, ten bows for every butt of manty; Malmyre or Tyre wine, at that time came chiefly from Giotto, which then belonged to the Venetians; and the price of bows, it appears, had risen from 40s. to 8l. a hundred (Arch. vol. vii.) In the 38th of Henry Vili. the price of a yeare bow was reduced to three shillings and four pence. (Ibid.)

In the ages of chivalry its use was considered as an essential part of the education of a young man, who wished to make a figure in life: and even the ladies, as in later times, partook of the amusement. It is said of Margaret the daughter of Henry the VII. that when she was on her way to Scotland, a hunting party was made for her amusement in Alnwick park, where she killed a buck with an arrow. (Leland's Collect. vol. iv. p. 278.) And the use of the bow was more than once practised by queen Elizabeth. The ladies, however, might probably have used the cross-bow.

James I. lifted one or two commissions for the prevention of enclosures in the grounds which had formerly been used for the practice of the bow; agreeably to which, the archers' grounds in the immediate neighbourhood of London were reduced to the same rate they were in in the beginning of the reign of Henry VIII. (Strutt's Sports and Pastimes. p. 14.)

Among the ancient charters preferred in the British Museum (Kol. i. 8.) is a petition of the bowyers, fletchers, archer-head-makers, and string-makers, dated 1635, requesting the king to appoint Richard Adams and Jeffery Le Neve to put in force the statute of the thirty-third of Henry VIII. It was referred by the king to the privy council; and a commission, the original of which, with the broad seal annexed, is in the fame collection (xii. 68.) was afterwards directed to "Timothie Taylor, John Hobart, Henry Hobart, and Jeffery Le Neve for the maintenance of artillery, archery, and shooting in long-bows; to enforce an act of the thirty-third of Henry Vili. that all persons under 60 years of age should use and exercise in shooting in long-bows; and that men children, from 7 to 17 years of age, should be instructed in the same." This it seems, was one of the last acts by which public encouragement was given to archery. The great body of the people, from the improvements that had been made in military tactics, were not likely to support the commissioners in what was now proposed: and the troubles which were rising turned the attention of the legislature to more serious objects.

Acham (Toxophilus, 1571. 410.) says, it was necessary for the archer to have a bracer, or close sleeve, to lace upon the left arm, that the bow string, when loosed from the hand, might not be impeded: to this was to be added a floating glove, for the protection of the fingers. The bow, he tells us, should be made with well-tapered wood, and formed with great exactness, tapering from the middle towards each end.
found the long bow a more effectual weapon; though the
French, even in the reign of Henry V., after the English
bow had often proved superior in execution, to the great
cost of their cannon, were still attached to the cross-
bow; and Henry V. as Duke of Normandy, confirmed the
charter and privileges of the Balfarin, who had long been
established as a fraternity at Rouen.

Their use, under our two last Henrys, has been already no-
ticed as frequently forbidden; and by the statute of the 15th
of Henry VIII., a penalty of ten pounds was inflicted on
every one who used a cross-bow might be found.

From this time they seem to have been chiefly used for killing
deer (see Shakespeare's Henry VI.), till, in 1679, they
were again used by the English as a military weapon, in the
expedition to the island of Rouen. (Gent. Mag. vol. liii.
p. 209)

The cross-bow is of a most inconvenient form for carriage,
even with the modern improvements; and in case of rain
could not be easily secured from the weather. After the
first shot, moreover, it could not be re-charged under a con-
derable time, whilst the bolts are also heavy and cumbersome.
The English long-bow, on the other hand, together with
the quiver of arrows, was easily carried by the archer,
easily secured from rain, and re-charged almost instantaneously.
It is not therefore extraordinary, that troops, who
frequently used this most effectual weapon, should generally
obtain the victory, even when opposed to much more numero-
sous armies. (Barrington's Observ. on Archery, Arch.
vol, viii.) The reach of the cross-bow was confined; that of
the long bow more extensive; although, when the armies
were opposed at no considerable distance, the quarrels of
the former might possibly be poured in with the most regular
effect.

Bow, or Stratford-le-Bow, in Geography, is a vil-
lage of Middlesex, in England, seated on the river Lea, at
the distance of about two miles and a quarter from London.
The village has no particular claims to public notice, but from its
ancient bridge, which crosses the river Lea at this place.
This structure is said to have been the first arched bridge
erected in England. Stowe, Oldbid, and some other antici-
papers, concur in ascribing its first building to Maud, or
Matilda, the queen of Henry I.; and thence some writers
consider it to be the original tradition of its being the most ancient
arched stone bridge of this country. The learned Stowe
relates, that Matilda had been "washed in the water, in palling
this dangerous ford," and to provide against such accidents
in future, caused this, and another smaller bridge to be
erecied, "arched like a bow," and thus the term, "arched bridge,
"which he further observes, "was a rare piece of work; for before that time the
Lea had never been ford in England." An old bridge of three
arches still occupies the place of the original structure.
Through this place, and over this ford, pulled the ancient
Roman road, called Watling Street, from London (London)
Canterbury (Coke's Eng.) From this arched bridge, and the name St. 
ford, this place evidently derives its name.

At a short distance northward are the Temple-Mills,
which anciently belonged to the knights Templars, and
afterwards to the knights of St. John of Jerusalem. In the
year 1520, they were used for brick works, but are now
appropriated to the manufacture of sheet lead. (Lyon's Envir-
ons of London, vol. iii. p. 386)

Bow, a small market town of Devonshire, in England, sit-
ed on the banks of one of the branches of the river Tor. De-
prived of the advantages of manufacture, and situated at a dis-
fance from the great turnpike road, this place is fast sinking
into decay, and at present consists of only 102 houses, most of
which
which are occupied by the peafantry. Yct here is a small show of a market on Thursday, and it has two annual fairs. A few blacksmiths, carpenters, and shoemakers, are the principal tradesmen of the place. It is 188 miles W. of London; the parish contains 677 inhabitants.

Bow, an iflant in Lough Erne, county of Fermanagh, Ireland, on the northern part of the lake, and one of the largest in it, being three miles long, and one a half broad. It is well-wooded, and contributes much to the beauty of the lake. It is about 15 miles from Enniskillen.

Bow, an iflant in the South Pacific Ocean, about 10 leagues in circumference. S. lat. 13° 23'; W. long. 141°.

Bow, a township of America, in Rockingham county, New Hampshire, feated on the well bank of Merrimack river, south of Concord, and 53 miles from Portsmouth; containing 568 inhabitants.

Bow, in Mosaic, denotes a machine that serves to play, or give the found to, volis, violins, and other instruments of that kind, by drawing it gently over the strings thereof.

The bow consists of three parts; the fift is the flick, or wood, to which the hair is fastened; the fccond is composed of about eighty or an hundred horse-hairs, or filaments of silk; the third is the nut, a fort of half-wheel, which fervices to keep the hairs in the due degree of tension.

The ancients do not appear to have been acquainted with bows of hair: in lieu of these they ftruck their instruments with a plec trium; over which our bows have great advantage, for giving long and short founds, and other modifications, which a plec trium cannot produce.

Bow, in Trade and Manufactures, denotes a flexible instrument confifting of a piece of fleece or iron, to the two ends of which is fastened a cat-gut, used by fmiths, watch-makers, and other artificers, for the piercing and turning of divers farts of works.

This is more peculiarly called a draw-bow. It is sometimes falso made of wood, whalebone, and the like.

Operators in Mosaic have a fort of bow made of a piece of eflatic wood, with a fraft wire fastened to the ends of it, which ferves to faw hard and precious flones. Letter-fellers have also a bow whereby to keep the matrix even.

See Foundery.

Bow, among Builders, denotes a beam of wood, or frafts, with three long fereves, that govern or direct a fath of wood or ffeel to any arch; chiefly used in drawing draughts of ships, and projeltions of the sphere, or wherever it is requisite to draw large farches.

Bow, in Navigation, an instrument formerly used for observing the altitude of the fun, in order to determine the latitude of the ship.

This instrument consists of the five following parts; viz. fift, an arch, or portion of a circle, capable of containing upwards of ninety degrees, whence the name of the instrument; fccond, a ftraight rod or bar, equal in length to the radius of that circle of which the arch is a portion; and three vanes, called the figh, fhadle, and horizon vanes.

The arch of the bow is divided into 90 degrees, and numbered from the top downwards; and these degrees are subdivided into halves, quarters, or tenths, &c., according as the fize of the instrument will admit; but the common method is to divide the degree into three equal parts, and by means of concentric arches and diagonal lines, the subdivisions may be carried as low as two minutes.

One end of the radius or ftraight bar is put into a perforation in the arch at 45 degrees; and the horizon vane, having a narrow fhit in it, through which the horizon is to be feen at the time of obfervation, is to be put upon the other end of the radius. The fhadle vane, which is sometimes fitted up with a convex lens, is placed on the arch above 45 degrees; and the fight vane, having a small perforation, through which, and the fhit in the horizon vane, the fight is to be directed to the horizon, is put on the arch below 45 degrees. These two vanes are moveable upon the arch. The manner of using this instrument is as follows:

1. To observe the meridian altitude of the fun with the bow.

With the latitude of the ship by account, and the fun's de-inition, find the effimate meridian altitude, which will be equal to the fun, or difference, of the complement of the latitude of the ship by account, and the de-inition of the fun, according as they be of the fame, or of a contrary de-nomination. Then place the fhadle vane to any whole degree, as much above 45 degrees as amounts to nearly half the effimated meridian altitude, and the fight vane is to be placed as much below 45 degrees. Now let the obferver look to the opposite point of the horizon with respect to the fun, and hold the bow vertically, and in due manner that the horizon may be feen through the fhit in the horizon vane, the eye being placed at the fight vane; then, if the bright folar fpot, from the lens in the fhadle vane, is upon the fhit in the horizon vane, the fight vane is in its proper place; if not, the fight vane is to be raifed or defpelled accordingly: continue obferving in this manner, until the fun has attained its greatest altitude; and the degrees, and parts of a degree intercepted between the fiducial edges of the two vanes, will be the fun's meridian altitude; and hence the true latitude of the ship may be found as usual.

When the fun begins to fall, that is, when the altitude diminishes, or the fun is past the meridian, the folar fpot will appear above the fhit in the horizon vane, that fhit and the horizon being in one.

2. To observe the altitude of the fun, when off the meridian, by the bow.

Let the altitude of the fun, at the time of the obfervation, be effimated; then place the fhadle vane to any whole degree, as much above 45 degrees as is about half the altitude by effimation; and move the fight vane upwards or downwards, until the folar fpot is upon the fhit in the horizon vane, at the fame time that the horizon is feen through the vane; and the intercepted degrees and parts of a degree upon the arch, between the fight and fhadle vanes, will be the altitude of the fun.

Bow, in Ship building, that circular part of a ship in which the item is in the middle, and its extremes near the foremost part of the fore-chains. A proper form of a bow is of the utmost conquence. A vessel with a sharp bow will, ceteris paribus, fall farther in smooth water than one with a falt bow; but in a high sea, she will plunge and dive greatly more, and thereby diminish her rate of falling. A proper medium between these two extremes, confident with the form of the ship, is, therefore, to be employed. M. Bouguer has paid very particular attention to this subject; and he has given a great number of tables, deduced from algebraic formulæ, for the construction of bows that will meet with the leafl refillance, and that will have the greatest velocity, or of such as will render a ship more capable of carrying, and at the fame time will divide the fluid with the greater facility; also, of the greater motion which, he says, differs in some cafes from that of the greatest velocity. M. Bouguer observes, that it is very doubtful whether that figure, which meets with the leafl refillance in dividing the water, may be the most advantageous to acquire the greatest degree of velocity: for it is
possible that a bow which meets with a little more resistance may render the ship capable of carrying a proportionable quantity of more sail, although the two bows, which may be distinguished by naming the one that of the lee resistance, and the other that of the greatest velocity, should have such an affinity to one another that one should, in a great measure, partake of the most essential properties of the other.

Bow, *Bold*, a full high bow.

Bow, *Lean*, a sharp bow, having little bearing or support, so that, in a rough sea, a vessel with a bow of this kind is apt to pitch greatly, which retards her rate, and also to ship much water.

Bow, *Starboard*, that part upon the right-hand side of the stem, to a person on deck looking forward; and that part upon the left-hand side is called the *larboard bow*.

Bow, *Wentling*, is that part of the bow towards the wind when a ship is close-hauled; and the other part is called the *lee bow*.

Bow, *On the*, an expression used to denote the position of any object, as a ship, the land, &c. appearing in the direction of some particular part of the bow. If the ship is sailing directly towards the object, it is said to be *right a-head*; if not, the object is said to be on the *larboard*, or on the larboard bow; or it is said to be on the *wentling*, or on the lee bow. If the object is in the direction of any particular part of the vessel, with respect to the observer, as the cat-head, &c. it is then said to be right over the cat-head.

The position of an object, with respect to the course of the ship, may be estimated by the intercepted portion of the horizon between them; and in this case it may be expressed either in points of the compass, or in degrees, but the former is most commonly used. Hence, if from a ship running N. by W. with her larboard tacks aboard, a light or fair wind was observed to bear N.W. by N., it would be said to bear two points upon the lee bow.

When the angle, contained between the object and the ship's course, is greater than four points, it is usual to express the bearing from the beam, thus, in place of saying that an object bears six points on the larboard bow, it is expressed to bear two points before the beam.

Bow-fanter, an Under officer of the foremast, who is to observe and take notice of all manner of trespas against vert or venion; and to attach, or caufe to be attached, the offenders in the next court of attachment.

Bow-compaies. See Compass.

Bow-dyes, a new kind of scarlet-red, superior to madder, but inferior to the true scarlet-grain, for mixtures and dura- tion. It was brought into England, and first practised at the village of Bow, near London, by Kepler, a Fleming, in the year 1643; whence its name.

In the year 1667, another Fleming, named Brewer, invited to England by Charles II., with the promise of a large salary, brought this art to great perfection. Thafe accounts, how- ever, and the names of the persons, are extremely dubious. Anderson's Commerce, vol. ii. p. 77. Beckman's Hist. Invent. vol. ii. p. 206.

Bow-legged, in Surgery. See Bandy-legs.

Bow-net, or *wheel*, an engine for catching fish, chiefly lobsters and crabs-fish, made of two round wicker-baskets, pointed at the end, one of which is thrust into the other; at the mouth is a little rim, four or five inches broad, somewhat bent inwards. It is also used for catching sparrows.

Bow, rain. See Rain-bow.

Bows of a faddle, are two pieces of wood laid archwise, to receive the upper part of a horse's back, to give the saddle its due form, and to keep it tight.

The fore-bow, which sustains the pommel, is composed of the withers, the breadth, the points, or toes, and the coking.

The hind-bow bears the trusslequin, or quilted roll.

The bows are covered with finewas, that is, with hulls pizzles beaten and fo run all over the bows, to make them stronger. They are likewise strengthened by bands of iron, to keep them tight. It is on the lower side of the bows that the saddle-strap are nailed; the use of which is to make fall the girths.

Bow pieces, a gun, or piece of ordinance placed in the bow.

Bow-grace, or *Bow-grafe*, a frame or composition of old ropes, or junk of cables, used to be laid out at the bows, stems, and sides of ships, to preserve them from bodies or fields of ice, when, in high latitudes where these are expected.

Bow-flower. See Gardling of bow-flowers.

Bow-flower. See Saw.

BOWDOIN, in Geography, a township of America, in Lincoln county, and district of Maine, on the north-eastern bank of Androscoggin river: distant from York, north-easterly, 36 miles, and from the mouth of Kennebec river 6 miles, and 166 N.E. from Boston. It contains 593 inhabitants.

BOWDOINHAM, a township of Lincoln county, and district of Maine, separated from Portland borough, and Woolwich south-east, by Kennebec river. It lies 171 miles N.E. from Boston, and contains 455 inhabitants.

BOWED, in Botany, (arcuatus), bent like a bow; a term expressing the direction of filaments, and the figure of a legume. It is employed also by Garret, to denote that figure of the cotyledons which is found in some of the Leguminosae and Liliaceae, in canella, myrtus, cylius, scorpius, &c. and that figure of the embryo which occurs in allium, moraca, apharagis, &c.

BOWEL-CALLED, in Farriery, denotes a laceration occasioned by the tightness and heat, or friction, of the girths, just behind the elbows of the fore-legs, and is soon hardened and obliterared by two or three applications of a soft sponge, impregnated with common vinegar.

BOWELLING, *eveneration*, the act of pulling out the entrails of an animal. Bowelling makes part of the progress of embalming.

Bowelling is also a part of the punishment of traitors in England, who are to have their bowels ripped open, torn forth, and burnt before them. *Tractation, suppuration, declination, eveneration, & querulation adjuvivit.* Knight sub. Edw. ii. in the feast of Hugh Spencer.

BOWER, ARCHIBALD, in Biography, a native of Scotland, was born at or near Dundee in 1656, educated in the Scots college at Douay, and admitted, in 1706, into the society of Jesuits at Rome. After some varieties of situation and employment, during the succeeding interval, he at length, viz. in 1723, settled at Macerata, where, according to his own account, he performed the office of councillor to the Inquisition: conceiving disgust, as he states the fact, at the enormities committed by this tribunal, or, as his enemies
affronted, charged with incontinence, he removed, in 1726, to Perugia, and secretly made his escape to England. Of the circumstances attending his escape he has given a very ample account; but his written documents and oral testimony have been found to differ in several particulars from each other, and of course his integrity was not only suspected but reproached. Soon after his arrival, he was introduced by Dr. Aspinwall to Dr. Clarke and to Bishop Berkeley, from intercourse with whom, added to his own reading and reasoning, he obtained, as he says, the fullest conviction that many of the favourite doctrines of the church of Rome were not only repugnant to scripture and reason, but wicked, blaspheous, and utterly inconsistent with the attributes of the deity. Under the impression of these sentiments he withdrew himself from the Roman communion, and abandoned the order with which he had been connected. His mind feems at this time, according to his own account, to have been in a state of scepticism and indecision on the subject of religion; and though he continued a Protestant for about six years, he connected himself with no particular denomination of Protestant Christians. At length, however, he conformed to the church of England, alleging that this church was "as free in her service as any reformed church from the idolatrous practices and superfluities of popery, and less inclined than many others to fanaticism and enthusiasm." By the recommendation of Dr. Goodman, physician to king George I., he obtained patronage in the family of Lord Aylmer, and was entrusted with the education of two of his lordship's children. By Lord Aylmer, he was introduced to Lord Lyttleton, who considered him as a kind of religious confessor, and remained his active friend and zealous advocate, even when he was defeated by almost every other person of any distinguished reputation. Whilst he lived with Lord Aylmer, he formed a connection with the book-sellers, and was employed, first, in a monthly publication, entitled "History Literaria," and afterwards in the compilation of the "Universal History." The part of this work which he undertook was the Roman history; but in the execution of it he is charged by his coadjutor, George Phalanusas, with having unduly extended it in some parts, and in others, particularly in the Byzantine history, with having injuriously abridged it. By the emoluments accruing from his tuition and writings, he accumulated a considerable sum of money, the disposition of which led to discoveries which very materially injured his character, and subjected him to just reproach. According to his own statement, he proposed to purchase a life annuity with this money, amounting to £100 l. of old South-Sea annuities; but being disappointed in these views, he negotiated with Mr. Hill, a Jesuit, respecting the loan of it; and obtained from him an interest equal to that which he might have made of it by the purchase of the annuity in which he was disappointed. A very different account of this transaction has been given by those persons who have questioned his integrity; and it must be acknowledged, that it is accompanied with much kind of evidence, as leaves little room for hesitation in admitting the credibility of it. They allege, that being desirous of re-admission into the church, which he had abandoned, he made use of his money in a way which would serve to recommend him to the superiors of the society with which he wished to be re-united. Accordingly, he proposed to Father Shirburn, then provincial in England, to deliver up to him, as representative of the society, his whole flock, on condition of their granting him a life-annuity, of 7 per cent. The offer was accepted; and Bower paid at sundry times sums of money, amounting in the whole to £350 l. and stipulated by a bond to receive yearly 94 l. 10s. In consequence of this negotiation, Bower was re-admitted, in a formal manner, into the order of Jesuits, at London, about the end of the year 1744, or beginning of the year 1745. Afterwards he determined, for reasons not satisfactorily ascertained, to separate from the order of Jesuits; and upon leaving them he obtained a return of his money. When a second edition of the "Universal History" was in contemplation, the book-sellers, very unfortunately for themselves and for the credit of the work, engaged Bower to revise and correct it; but though he received a considerable sum of money, not less than 300 l. he published it without any material emendation. In 1747 he announced to the public proposals for a "History of the Popes," the first volume of which was presented to the king in the following year. In recompense of his labour, Mr. (afterwards lord) Lyttleton, obtained for him the place of keeper of queen Caroline's library; and his credit being somewhat revived, he married a niece of bishop Nicholson, with a fortune of 4000 l. His "History of the Popes" was continued, in successive volumes, printed at different periods. In 1754 his unalterable friend, Mr. Lyttleton, appointed him clerk of the buck-warrants, a place which, though of no great emolument, evinced his continued attachment. In this year the first attack was made on his "History," which the advocates of popery considered as peculiarly hostile to their church, in a pamphlet printed at Doway, entitled "Remarks on the two first volumes of the late lives of the popes," 8vo.; a publication ascribed by Mr. Bower to a pamphletプリントされた名前はButler, one of the most active and dangerous emissaries of Rome in this kingdom. But an event soon happened, which was much more ruinous to the reputation of Mr. Bower, and which sunk him into total disgrace; and this was the divulging of his correspondence with the Jesuits. The charges alleged against him were repelled with spirit by himself; but his veracity, though attested by an affidavit, was questioned; and he had fearlessly any friend left besides lord Lyttleton. In the course of this controversy, he was in danger of being exhibited on the stage, as a mock convert of profligate character, by Mr. Garrick, on account of the manner in which he mentioned that incomparable actor and his lady, in his "Summary of the controversy between the papists and the author," 4to. But Mr. Garrick, by the mediation of lord Lyttleton, was induced to wave that public shaftesmiff which he had intended. The reputation of Bower's history declined with his own; the fourth volume was published during the agitation which the controversy in which he was engaged had produced; the fifth appeared in 1763; and the sixth and seventh volumes were prefixed to the public a little time before his death; and whatever may be the estimation in which the preceding volumes deserve to be held, these two are executed with such haste as to deserve very little regard. The whole period from 1600 to 1723 is comprehended in 26 pages! Bower died in 1766, at the age of 80; and he left a will, dated in 1749, which contained no written declaration of his religious principles, agreeably to the practice which very much prevailed in those times, and which, in his peculiar circumstances, might have been reasonably expected. His widow, however, sometime after his death, attested his having died in the Protestant faith. New Biogr. Dict. 8vo. 1798.

**Bower, Lady's, or Virgin's, in Botany. See Clematis.**

Bower, in Gardening, a shady place, under covert of trees or branches interwoven. A bower differs from an arbour, in that the latter is always built long and arched, but a bower either round or square at the bottom, and made with a fort of dome or ceiling at the top. See Arbours.

**Bower-anchors, left and small, in Sea-Language.** See Anchor.
BOWES, in Geography, a town of Yorkshire, England, is more noted for its former than present confluence. During the abode of the Romans in Britain, this place was chosen for one of their military stations; and from an interred altar found here, it appears, that, in the reign of Severus, when Vitruvius Lanus was legate and proprietor of Britain, the first cohort of the Thracians was in garrison here. Hoffley, in his Britannia Romana, says, "there is an old castle here, which, with the church, stand in the north part of the old Roman axation, and no doubt have been built out of the ruins of it." About two furlongs south of this axation (called Luviania) runs the river Greta.

Bowes is included in that division of the county of York, called Richmondshire, in the north riding, at the distance of 4 miles from Barnard Castle, and 248 miles north from London. The town consists of one long street, running east and west, and contains 120 houses and 670 inhabitants. Here is a weekly market on Fridays, and one fair annually. This parish includes the three townships of Bowes, Boldron, and Gilmonby. The surrounding country, consisting mostly of moors and commons, abounds with coal and lead mines, which, with the royalty, belong to the proprietor of Carlton Hall.

About two miles from Bowes, is a singular natural curiosity, called God's bridge, which is formed by a rude arch of freestone. This stretches across the river Greta, the waters of which are precipitated over different ledges of rocks, and soon afterwards sink beneath the surface, and continue through a subterraneous passage of about half a mile, which can again emerge into light through some rocky cavities. Gough's edition of Camden's Britannia. Hutchinson's Tour to the Lakes, 8vo.

BOWETS, or Bowes, among Falconers, denotes a young hawk when the draws things out of her nest, and covets to chimney on the houghs.

BOWGE of court. See Bouche of court.

BOWLS, denotes either a ball of wood for the use of bowling, or a vessel of capacity for holding liquors.

Bowl-throw. See Wassen-bowl.

BOWLING-flower, a species of small flowers, of an indeterminate texture and figure, generally roundish, found on the flowers of the sea and banks of rivers. Bowlers, or bowlder-tones, are only humps and fragments of stones or marble, broken from the adjacent chips, and rounded by being bowled and tumbling to and again by the action of the water; whence the name bowlder-tones, as being formed by an action like that of a ball, and thereby reduced to the shape of one. Neither the bowlers nor rubble-tones are ever involved with an exterior strong crust or skin; it is plain from the manner of their formation they cannot. This is one mark by which they are distinguished from pebbles, pebbles, or other native nodules, which were formed before the subsiding of the matter of the flats, and are always covered with such a crust or skin, unless it has been worn off.

BOWLE. Jowett, in Biog. Dict of Idiomology near Salisbury, was a descendant of Dr. John Bowle, bishop of Rochester in the 17th century, born in 1625, and being admitted of Oxford college, in the university of Oxford, took the degree of master of arts in 1730. He had the honour of being, according to Dr. Douglas's account, the original detector of Lander's forgeries, for the purpose of injuring the reputation of Milton. He was the author of a "Letter to Dr. Percy," and editor of Don Quixote in Spanish, and of Marlow's Satires, and some old poetry in English. He died in 1788. New Biog. Dict.

BOWLINE, in Sea-language, a rope fastened near the middle of the leech, or perpendicular edge of the principal square sail, by three or four subordinate parts called bridles, and leading forward towards the bow, and hence its name. It is always used when the wind is so unfavourable that the sails must be all braced sideways, or close-hauled to the wind; in this situation, the bowlines are employed to keep the weather or windward edges of the principal sails tight forward and steady, without which they would be always flitting, and rendered incapable of service. Neither the sprit-raise, nor sprit-raise top-fail has bowlines, as there is no place forward to which they could lead, and therefore these fails cannot be used when the vessel is upon a wind. The bowlines of the fore-sail, fore-top-sail, and fore-top-gallant-sail, lead to the boatsprit. Those of the main-sail, main-top-sail, and main-top-gallant-sail lead to the foremais; and the mizen-top-sail, and top-gallant bowlines lead to the main-mast.

To check or set the bowline, is to slacken it, when the wind becomes large, or more aft; and when the wind comes more a-head, or the ship lies nearer to it, so that any particular sail is flitting, or nearly so, it then becomes necessary to get the weather-leech of that sail forward more, that the sail may stand, or be kept full; and the order for this purpose is to haul towards, or take a pull of the weather bowline belonging to that sail.

BOWLINE-bridles, the ropes by which the bowline is fastened to the leech of the sail.

BOWLINE-knot, a particular kind of knot which will not slip, by which the bowline bridge is fastened to the cringle. See Knot.

BOWLING, the act or art of throwing bowls. Bowling, among us, is chiefly the name of a game or exercise, practised either in open places, as bares and bowling-greens, or in close bowling-alleys. The skill of bowling depends much on a knowledge of the ground, and the right choice of a bowl suitable to it: for close alleys the flat ball; for green towards plain and level, the bowl as round as a ball is preferred.

The terms used in bowling, are, to bowl wide, which is when the bias does not hold; or is not strong enough; narrow, when it is too strong; or holds too much; finely bowled, is when the ground is well chosen, and the ball passes near the block, even though it goes much beyond it; bowling through, or a yard over, is done in order to move the block; an over-bowled, that which goes beyond it; a bowl laid at hand, is that put down within the gambler's reach, to be in the way of the next bowler, and hinder his having the advantage of the block ground; bowling at length, neither bowling through nor short; a dead length, a just or exact one; throwing or flinging, is discharging a bowl with a strength purposely too great for a length, in order to carry off either the block or lone near block; bowl-room, or mowing-room, is when a bow has free passage, without striking on any other; get off, is when a bow being narrow, is wanted to be wider; bow left at block, that nearest the block; drawing a card or bowl, is to win it by bowling nearer, without flitting either the bowl or block; a bowl is said to fail, when it meets with some obstacle in the ground which retards its motion, and weakens its force; it is gone, when far beyond the block. Block signifies a little bowl laid for a mark, also called a jack. Mark, is a proper bowling distance, not under to many yards; and being at least a yard and a half from the edge of the green. Ground, a bag or
handkerchief laid down to mark where a bowl is to go. Lead, the advantage of throwing the block, and bowling straight. Call, is one bowl bow at an end. End, a hit, or when all the bowls are out. The game, or up, is five calls, or five bowls.

BOWLING-GREEN, in ornamental Gardening, is a spacious plot laid even with turf in pleasure, or other grounds, designed for the purpose of ornament, as well as amusement, in the hummer leam, in bowling upon.

These sorts of compartments should mostly be formed as near the houses or habitations as possible, being laid out on the back fronts so as to serve by way of lawns to such parts as they may be situated in; as at the termination of walks or avenues. They may also be contrived amid detached contiguous plantations, or wildernefs quarters, to serve as portions of yard ground, or as openings to such places, and should always, if possible, have tall trees so situated on the boundaries, as to afford shade, especially in the afternoon. The dimensions must vary according to circumstances; but where there is scope of ground sufficient, they should not be less than from half an acre to an acre. The most common form is that of a square moderately extended; but some are made oblong, others circular, though, to suit the general plan or figure of the ground, they may be of any other form, so as to avoid the garden-ground. Their boundaries may also be spacious planted borders of either the straight or serpentine kind. The plane or surface of the greens should be perfectly level, and as high, at least, as the general level of the adjoining ground, so as that it may be always preferred from fragment moisture.

In forming these plots, the surface should be levelled in the most exact manner, and laid with the finest grass turf that can be procured from a clofe planter, common, or down. See TURF. The extent and proper levels of the greens are then set out with flake or squares placed round the extremities or boundaries, at fifteen or twenty feet distance, on which should be marked the determinate levels of the ground, and from which, on the opposite sides, levels in other crofeways at the same distance should be made; and then, according to these levels, proceed by line and fpace to form the ground to a proper surface, making it up firmly in lines from flake to flake; the pannels or spaces between being made up equally firm and regular, fo that no part may sink in a hollow afterwards. The whole should then be raked level, and finished off evenly and smooth. Two or three inches deep of light sandy soil, or any light dry poor earth may then, if necessary, be laid even over the surface, as equal in quantity as possible, by that means the turf or grass will form a moft level, regular, and even fward.

The grassy surfaces should always be formed by laying them with fresh cut turf, as being much superior to the method of only fowing them with grass seeds. The turfs should be cut each a foot wide, a yard long, and about an inch thick, and laid with exactness, closely joining them edge to edge, then beat them well down with large wooden beaters, repeatedly rolling them with a large heavy iron roller.

The best season for performing work of this fort is the autumn, or very early in the spring; but the first is to be preferred when it can be conveniently done, as the turf has time to establish itself well before the hot feanon sets in.

In order to keep bowling-greens neat after being thus formed, they require frequent mowing in summer, probably once or twice a week, or oftener, in order to keep the grass sufficiently fine and short for bowling, as well as occasional rolling to preserve the surface firm and even. When wormy calls are much thrown up over their surfaces, they should be poked occasionally to break and scatter them, and then well rolled with a wooden roller, to which the scattered earthy particles may adhere, and the surface be thereby made more clean. See Polling Grass. Where coarse weeds, as the dock, dandelion, &c. prevail themselves, they should be wholly eradicated, to prevent their seeds from being dispersed over the surface, and new plants thereby raised which would prove injurious, and render the turf unfit for the purpose of bowling upon.

BOWLING-Green, in Geography, a village of Virginia in America, situated on the north-road, 22 miles S. of Frederickburg, 48 N. of Richmond, and 25 N. of Hanover court-houfe.

BOWNESS, in Geography. See BORROSTOWNESS.

BOWSE, in Sea-language, an order to all the people employed in hauling upon any particular rope, to pull together. Beroft away, that is pull away, and all at the same instant.

BOWSPRIT, a large boom or spar projecting from the bow of a fhip, over the item, and hence its name. The bowspirt makes an angle with the keel, which is various, according to the fancy of the builder; being, in general, between twenty degrees, and three points or upwards, as the height of the bowspirt at the cope, above a horizontal line at the keel, extends from one third to one half of its length. According to Mr. Chapman, the elevation of the bowspirt of a merchant fhip ought to be three-sevenths of its length, and in fhips of war four-sevenths. This elevation of the bowspirt is called its fleeving or fiving. Mr. Gower is a strong advocate for diminishing the fleeving of bowspirts, and upon this subject he expresses himself as follows: 'As every position of the rudder, except a middle one, takes from the speed of the vesflel, it should be preferred as much amidfips as possible. Almost every fhip under full fail, with a fide wind, carries a weather-helm; to counteract which, it is recommended to lower the fleeving of the bowspirt to one angle of five or ten degrees with the keel, and to increase the jib-boom in froundness, that a large jib of strong canvaf may be carried in moft weathers. With the bowspirt lowered, it will be better without a spritfail yard; and let the jib boom be secured from the cat-heads and item, by a flanding and travelling guy on each fide, and a fanding and travelling martingale.' In cutters, schooners, luggers and shallops, the bowspirt is nearly parallel to the keel.

The length of that part of the bowspirt which is without the item, is generally equal to the extreme breadth of the fhip. In trading fhips, the celebrated Mr. Chapman makes the bowspirt to be equal to the fum of the extreme breadth, and one-tenth of it; and in fhips of war, it is equal to the fum of the extreme breadth, and three-twentieths of the fame. Thus, if the extreme breadth of a fhip is 32 feet, the length of that part of the bowspirt beyond the item will be 35.2 for a merchant fship, and 36.8 for a fhip of war.

The diameter of the bowspirt is equal to half the fum of the diameters of the main and foemails.

As the safety of the foemail depends greatly upon the bowspirt, every precaution, therefore, is used to have this belt well fecured. The keel is firmly falted to the decks; that part of the bowspirt at the item is strongly falted thereto by several turns of a rope, which is called the running of the bowspirt; and the hulley connects the lower part of the item or cutwater with that part of the bowspirt at the foemail.

BOWYER, William, in Biography, an eminently learned printer, the fon of a printer of the fame name, was born in London, December 17th 1669; received his grammatical education under Mr. Ambrose Bowwicke, a non-juring clergyman
clergyman of acknowledged piety and learning; and was admitted, in 1746, as a hazar at St. John's college, in the university of Cambridge, where he continued for six years, and probably took his degree of bachelor of arts. Although his disposition was naturally reserved, yet he cultivated, during his residence at college, an intimate acquaintance with several respectable members of the university, and particularly with Mr. Markland, who was the father of Mr. Clarke, with whom he maintained through life a regular correspondence, which furnished a valuable treasure of polite literature and sound criticism. When he left Cambridge, he squatted as a school-master for the benefit of the family of Mr. Bonwicke, who died in 1722: and thus testified his gratitude for the allowance he had received from him in his education, at a time when the whole property of his father was destroyed by a fire. Having performed this act of kindness and of gratitude, he joined his father in the printing business; and began with a correct and complete edition of Selden's works by Dr. David Wilkins, in 3 vols. fol. As he read the proofs sheets, he drew up an epitome of the treatise 'De Synedriis.' This work was followed by an admirable sketch of William Baxter's Glossary of the Roman Antiquities; in which Bowyer sufficiently evinced his literary talents. In 1729, he was appointed printer of the votes to the house of Commons, which office he held for nearly 50 years. It is hardly necessary to mention the part taken by him, in 1731, in a controversy which is now sunk into oblivion. It produced, however, on his part, a pamphlet entitled "The traditions of the clergy not destructive of religion; being remarks on Mr. Harman's sermon, exposing that gentleman's deficiency in Latin and Greek, in ecclesiastical history and true reasoning." In the same year he printed, and is supposed to have translated, Voltaire's Life of Charles XII. of Sweden. In 1736, he was admitted a fellow of the Society of Antiquaries, of which he was an affiduous and useful member. His translation of "Trapp's Latin Lectures on Poetry," with additional notes, was published in 1742: and about the same time he corrected and formed anew an useful school-book, entitled "Selectæ ex profunis scriptoribus historiae." We should far exceed the bounds of this article, if we were to mention the prefaces, notes, and various additions, which he contributed to the works that issued from his press. We shall content ourselves with noticing some of the principal of this kind. In 1743, he wrote, as it is supposed, a small pamphlet on the present state of Europe, chiefly taken from Puffendorf; and, in 1746, he published the "Life of the emperor Julian," translated from the French of M. Etiètme, with curious notes, and a genealogical table. In 1750, he annexed a preface critical disquisition, and some valuable notes, to Kuller's treatise, "De vero uti verborum mediorem," which was published, with further improvements, in 1757. About the same time he wrote a Latin preface to Locke's "Veteres postea citati," &c., and soon after improved an edition of col. Bladen's translation of Cæsar's commentaries. In 1751, he wrote a long preface to Monteflini's "Reflections on the rise and fall of the Roman empire," translated the dialogue between Sylia and Socrates, and improved the edition by several corrections from the baron's "Spirit of Laws," as well as by his own notes. Of this work a new edition, with additional notes, was printed in 1759. In the same year (1751) he published the first translation that was made of Rousset's paradoxical oration, which gained the prize of the academy at Dijon, in 1750; and thus he first announced that singular genius to the attention and admiration of Europe. To Mr. Bowyer we are indebted for the notes signed (B) in the 4th volume of Swift's works, extracted from letters, which were printed but never published. His "Remarks on the speech made in common council, on the bill for permitting persons professing the Jewish religion to be naturalized, so far as it is usual," was intended for the purpose of allaying the ferment occasioned by the Jews bill in 1755, and of shewing, that whatever political reasons might be alleged against the bill, Christianity would in no degree be prejudiced by the indulgence proposed to be granted to the Jews. In this year also appeared his notes, annexed to bishop Clayton's translation of "A journal from Grand Cairo to Mount Sinai, and back again." In 1761, Mr. Bowyer was appointed printer to the Royal Society; and he had the honour of retaining that office till his death. Without mentioning other publications, in which he was concerned either as a writer or as an editor, we shall proceed to notice an excellent edition of the Greek Testament, in 2 vols. 12mo., which appeared in 1763, under the following title: "Novum Testamentum Graecum, ad fidem Graeciorum folum codicium MSS. nunc primum impressum, adhibitis J. J. Wettenio, justa sectiones Jo. Alberti Bengelii diviniti; et nova interpretationis ad ejus ilustribus. Accedunt in altero volumine emendationes conjecturales viarum doctrorum undique collectae." This edition was sold with great rapidity; and the conjectural emendations were well received by the learned. There were separately published, with very considerable enlargements, in one volume, 8vo., in 1762. A new and corrected edition of this Greek Testament, with the conjectures, in 4to. much enlarged from the margin of Mr. Markland's Testament, and by new communications from bishop Barrington, professor Michaelis, M. Stephen Welton, Dr. Gollet, &c. was printed by Mr. Nichols, in 1782 and 1783, under the inspection of the learned Dr. Owen, with his remarks. At the request of Thomas Holby, esq. Mr. Bowyer wrote, in 1765, a short Latin preface to Dr. Wall's "Grammatica Linguae Anglicanae," a larger English preface, written by him, and intended for that work, is communicated to the public in his "Miscellaneous Tracts," published by Mr. Nichols in 1785, 4to. In 1766, he formed a partnership with Mr. Nichols, who had been trained by him to the profession, and had afflicted him several years in the management of business. This connexion with a person, whose disposition was amiable and communicative, and who resembled himself in his solitude, by literary researches and publications, to promote the cause of literature, engaged the prosecution of views and plans similar to his own; and warranted a confidence which enabled him to withdraw, in the declining state of his health, from the fatigue of active employment. It also afforded him greater leisure for indulging his own studious inclination. Accordingly, in this year (1766) Mr. Bowyer wrote an excellent Latin preface to "Joannis Hardium, Jefuiti ad conum suorum scriptorum veterum prolomogena," in which he gives an account of the nature of the work, and of the manner in which it had been preferred. About the same time were published Mr. De Mily's remarks on the extraordinary production of the celebrated Jefuit, in a Latin letter to Mr. Bowyer. In 1767, he was appointed, by the recommendation of the earl of Marchmont, to print the journals of the house of Lords, and the rolls of parliament. In this year he printed Mr. Clarke's learned work, entitled "The connection of the Roman, Saxon, and English coins," with notes by himself, together with a disquisition on the Roman selters, which was partly his own production, and an excellent index of his own compilation. In 1771, the late Matthew Raper, esq. communicated to the Royal Society a very ingenious "Inquiry into the value of
of the ancient Greek and Roman money," which was printed in the Philosophical Transactions; and Mr. Bowyer published, "Remarks," on this dissertation, which he intended as an appendix to Mr. Clarke's treatise on coins. Three small tracts were published by him in 1773, under the title of "Select Dicciplines: 1. of the correspondence of the Hebrew months with the Julian, from the Latin of professor Michaelis; 2. of the Sabbathial years, from the same; and 3. of the years of jubilee, from an anonymous writer in Maffon's Histoire Critique de la Republique des Lettres;", and in 1774, he corrected a new edition of Schrevelius's Greek lexicon, to which he added a number of new words, collected in the course of his studies. Of his critical skill in the learned languages he left in MS. many evidences, which appear in the additions made by him to the lexicons of Hederic and of Duftart, the Latin ones of Faber and of Littellon, and the English dictionary of Bailey; and also in the corrections and enlargements of Leigh's "Critica Sacra," and Dugard's "Lexicon Græci Tamenti alphabeticum," together with his notes on Mid- dleton's Life of Cicero, Duncan's and Bladen's Cæsær, Theocritus, Horace, and Pope, and an allaining number of critical remarks on the Old and New Testament. In 1774 was published "The origin of Printing, in two essays: 1. The subsidence of Dr. Middleton's dissertation on the origin of printing in England. 2. Mr. Meeran's account of the invention of the art at Haerlem, and its progress to Meutz; with occasional remarks, and an appendix." Of this work the original idea was Mr. Bowyer's; but it was completed by Mr. Nichols. A second edition of this work, which was well received both at home and abroad, was published, with very considerable improvements, in 1776. In 1777, he closed his literary career, with a new edition of Dr. Bentley's "Differtation on the Epistles of Phalaris," with additional notes and remarks by himself and others. On this occasion he was much indebted to the friendly assistance of Dr. Salter, late master of the charter-house, and Dr. Owen.

Mr. Bowyer had been always subject to a bilious colic, and for the last ten years of his life he was afflicted with the palsy and the stone: and yet he retained, to a great degree, a remarkable cheerfulness of disposition; and his faculties, though somewhat impaired, enabled him to derive great satisfaction from the conversation of his literary friends, to pursue a course of inconstant reading, which was his principal amusement, and to correct the learned works, especially the Greek books, which were printed at his press. Within a few weeks before his death he funk under his maladies and the progres of decay, and at length terminated a life of singular reputation and usefulness, on the 18th of November, 1777, in his 78th year. His numerous publications afford ample evidence of his talents and learning, and he was honoured with the friendship and patronage of many of the most distinguished ornaments of the age in which he lived. As a learned printer he had no rival for two or more half a century; and he was too distinguished by his moral qualities than by his mental abilities and literary attainments. Of his regard to religion, both in the principles and practice of it, his whole life afforded unquestionable evidence; his probity was inflexible; the promptitude with which he relieved every species of dis- tires marked the benevolence of his mind: and his modesty in endeavouring to conceal his benefactions reflects great hon- our on his memory. Although his literary avocations and natural temper induced him to seclude himself very much from the world, and from intercourse with any persons besides men of letters, he was reckoned to posses an excellent talent for discriminating the red characters of man-
BOX

on them with the fingers was effectually prevented. For
want of some contrivance of this kind, our sharpeners have
opportunities of playing divers tricks with the box, as
palming, topping, flabbing, &c. Hyde. Hist. Nerd. 2,

Box-room, a kind of cafe wherein the hearers are enclosed
for running Hum.

Box-money, at Hazard, is that which is paid the box-
keeper, or hum who furnishes the box and dice. Better
have the advantage over callers, as they have no box-
money to pay, which at long run would beggar the most
fortunate player. Hence some gamblers will never call,
for the expense of box-money.

Box of a plough, a name by which the farmers call that
cross-piece in the head of the plough, through which the
spindle of the two wheels passes, and to which are fastened
the two cross-flanges, serving, by their holes, to regulate
the height of the beam, the tow-chain below, the flake which
supports the bridge-chain above, and the galloways behind,
into which are fixed the wilds with the crooks of iron, for the
drawing of the whole plough along. This part of the plough
is placed between the beam and the flanks much below it,
and not far from the ground. See Plough.

Box of a rib-foree, two thin iron plates fixed to a handle;
in one of the iron-plates is an opening to receive a wedge,
by which it is fixed to the saw.

Box, strong, a coffe of iron, or of thick wood, secured
with iron plates, and a lock with several bolts, difficult
either to be opened or forced; chiefly used for putting
money in.

Box the compasses, in Sea-language, to repeat the opposite
points of the compasses alternately. Thus, N. S. N. by E.
S. by W. N. N.E. S.S.W. &c.

Box of the compasses, the square wooden box which con-
ains the mariner’s compass; in the construction of which,
no iron work is to be used.

Box of a watch, the case or cover.

Box of a wheel, the aperture wherein the axis turns.

Box-puceron, in Entomology, among old writers, the cocur
lefeirdum, an insect that infests the box, in common with
various other evergreens. See Hesperidum. The word
puceron, and ballard puceron, appears to have been formerly
applied indiscriminately to several distinct genera of insects
that infest plants, as those of the cynips, aphis, thrips, and
others.

Box-thorn, in Botany. See Lycium.

Box-tree, sand. See Hura.

Box-hauling, in Seaman’ship, a particular method of veering
a ship, when the swell of the sea renders tacking imprac-
ticable, or when there is not room to veer by the
common method of filling the head, and shivering the after-
falls. This operation is performed by putting the helm
hard a-lee, which brings the ship’s head to windward; the
after-falls, particularly the main-fall, mizen, and mizen
fly-fall, are to be hauled up; as soon as the falls begin
to shake, haul in the weather-head braces, and the lee-foree,
and fore-top bowlines; the ship’s head will then fall off,
which, together with the action of the water upon the
rudder, by the sternway the has acquired, will bring her
round until the wind is right aft; when her sternway will
have ceased, and then the helm is to be put hard a-weather:
in the mean time the after-falls are to be brated up, which
will greatly assist in bringing the ship round; the main-fall,
mizen, and mizen fly-fall are to be fet, the head-yards
braced up, as the ship comes to the wind, and the helm
shifted to its proper position.

Box-hill, in Geography, near Dorking, in Surrey, Eng-
land, received its name from the great number of box-trees
which ornament its shelving sides and summit. Many of
these are said to have been planted on the south side of it
by the celebrated earl of Arundel, in the reign of Charles I.
Since that period they have proved highly beneficial to the
proprietor, and to the public. “Formerly,” says Mr. Gilpin,
“the ships from the Levant brought such quantities of
this wood in ballast, that the trees on this hill could not
find a purchaser; and not having been cut in 6 years, they
were growing in many parts rankered. But the war having
diminished the influx of it from the Mediterranean, several
purchasers began to offer for this native wood; and in the
year 1795, for Harry Mildmay put it up to auction, and
sold it for the immense sum of twelve thousand pounds.”
This hill, and the neighbouring eminences, on which the
box-tree flourishes in such profusion and perfection, should
be considered as making a part of the natural history of
Britain. The extensive prospects commanded from this
place, combining with its singular and beautiful scenery,
frequently excite the attention and admiration of travellers.
In its immediate vicinity are several elegant villas, and the
river Mole, which runs under ground for some distance,
winds its flow waters beneath the precipitous sides of this
hill. Gilpin’s Observations on the Western Part of
ii. 1802.

BOXBERG, in Geography, a town of Germany, in the
circle of the Lower Rhine, and the Palantine; 34 miles E.
of Heidelberg.

BOXBOROUGH, a township of America, in Middle-
sex county, and state of Massachusetts, containing 412 inha-
bbitants; 30 miles N.W. from Boston.

BOXERS, a kind of athlete, who combat or contend for
victory with their fists. See Athlete.

Boxers are the same with those who, among the Romans,
were called pugiles. The ancient boxers contended with such
force and fury, that they frequently dafined out one an-
other’s teeth, broke their bones, and killed each other.
The strange disfigurement these boxers underwent were
such that frequently they could not be known, and rendered
them the objects of many raillery. In the Greek anth-
ology, there are four epigrams of the poet Lucilius, and one
of Lucian, wherein their disfigurements are pleasantly enough

Boxes, in a play-house, are little apartments behind and
aside of the pit. We say, the front boxes, the flage-
boxes, &c.

Boxes of the pump. See Pump.

BOXFORD, in Geography, a small township of Amer-
ica, in Essex county, Massachusettts, on the east side of the
Merimack river; 7 miles W. of Newbury port, and
containing 625 inhabitants.

BOXHORNUS, Mark Zuerius, in Biography, an
eminent philologgist, the son of James Zuerius, was born
at Berga-op-Zoom, in 1612, and assumed the name of his
maternal grandfather, Henry Boxhorn, a convert from
popery, and miniller of Breda. At Breda, where he was
educated, his proficency in literature was such, that at the
age of 17 years he published some Latin poems that
were well received, and at the age of 20 he was editor of
some learned works. In 1632, he became professor of
rhetoric in the university of Leyden. Declining to ac-
cept the invitation of queen Chrisitina to an honourable
office in Sweden, he succeeded Daniel Heinluis in the pro-
feßships of politics and history, both which departments
he occupied with great honour to himself and benefit to
his auditors. His literary career, however, was terminated
by death, in 1653. His works were numerous and curious.
He published, in addition to his juvenile labours as an editor,
notes upon Justin, Pliny's Epistles, and Tacitus, and a "Commentary upon the Life of Agricola," by the last-mentioned author. In a work written by him on the invention of printing, he endeavored to establish the claims of Haerlem in opposition to those of Muntz. He also wrote a Latin account of the siege of Brida. Among his political pieces are enumerated his defenses of the liberty of navigation claimed by the Dutch, a short account of the Dutch constitution, and a vindication of the rights of Charles II. to the English throne. He wrote "Critical and historical dissertations on the antiquities of Gaul and Scythia;" and "Sacred and profane history from the birth of Christ, to the year 1650," in one volume 4to.

His account of learned women never appeared. His letters, and his Latin and Greek poems, were printed after his death. Gen. Dict.

BOXING, the exercise of fighting with the fists, either naked, or with a rope or leaden ball grasped in them: in which sense, boxing coincides with the pugilatus of the Romans, and what, on our amphitheatres, is sometimes called trial of manhood. When the champions had στήθος, or balls, whether of lead or stone, it was properly denominated ἀγοραστικός. Potter, Arch. Grac. Lib. ii. cap. 21. Vol. i. The ancient boxing differed from the pugna cælestium, in which the combatants had leathern thongs on their hands, and balls, to offend their antagonists; though this distinction is frequently overlooked, and fighting with the cælestis ranked as part of the butcher's pugilis. We may distinguish three species of boxing; viz., where both the head and hands were naked; where the hands were armed and the head naked; and where the head was covered with a kind of cap called amphotides, and the hands also furnished with the cælestis, which fee.

Boxing is an ancient exercise, having been in use in the heroic times, before the invention of iron or weapons. Accordingly, we find in the Latin and Greek poets, several descriptions of this rudolf, and most dangerous of the gymnastic combats. In Homer, we have that of Epeus and Euryalos; in Theocritus, that of Pollux and Amycus; in Apollonius Rhodius, an account of the fame battle; in Virgil, that of Dares and Entellus; and in Statius, and Valerius Flaccus, are relations of several other combatants. Dioecor. Idyl. 22. Argonautica. l 2. Alexiad. l 1. Theocritus, l 6. Argonaut. l 4.

Those who prepared themselves for it, used all the means that could be contrived to render themselves fat and flabby, that they might be better able to endure blows; whence corpulent men or women were usually called pugiles, according to Terence: "Sicqua eft habitaro paulo, pugiam esse aiant." M. Burette has given the history of the ancient pugilate, or boxing, with great exactness. Mem. Acad. Inscript. tom. iv. p. 573, &c.

The athlete sometimes came immediately to blows, and began with charging in the most furious manner. Sometimes, whole hours passed in harafling and fatiguing each other, by a continual extension of their arms, rendering their mutual blows ineffectual and embarrassing by this mode of defence to keep off their adversaries. But when they fought with the utmost fury, they aimed chiefly at the head and face, which parts they were most anxious to defend, by either avoiding or catching the blows that were aimed at them. When a combatant threw himself with all his energy upon another, they had a surpising address in avoiding the attack, by a nimble turn of the body, which caused the incalculable adversary to fall, and deprived him of the victory. Notwithstanding ths ferocity with which the combatants contended, they were sometimes so exhausted by the duration of the combat, as to be under the necessity of making a truce, upon which the battle was suspended for some minutes, which were employed in recovering from their fatigue, and rubbing off the sweat with which they were bathed. They then renewed the fight, till one of them, by letting fall his arms through weakness, or by wounding away, indicated that he could no longer support the pain and fatigue, and defined quarter, which was condemning himself vanquished.

This art, adapted, as one might conceive, only to a period of barbarism, has in modern times been most appropriately by the English; and about half a century ago, it formed a part of the exhibitions at places of public amusement. It was encouraged by the nobility, and even tolerated by the magistrates. Before the establishment of Broughton's amphitheatre, a booth was erected at Tottenham court in London, the proprietor of which, Mr. Geo. Taylor, invited the professors of the art of pugilism to display their skill, and the public to attend their performances. The entrance money, amounting sometimes to 100 or 150l., was shared among the performers, in such proportion, that the victorious champion had two thirds of it, and the vanquished one third; and in some cases, both had an equal share. When complaints were made by the nobility and gentility of the inconvenience attending the exhibitions in Taylor's booth, they prevailed on Mr. Broughton, at that time of sitting fame in the clats of pugilists, to build a place better adapted for the purpose. A subscription was raised, and in 1742, a building was erected behind Oxford-road, and denominated "Broughton's new Amphitheatre." In this building, there were, besides a stage for the combatants, seats corresponding to the boxes, pit, and galleries in other theatres. In process of time, the public taste was refined and improved, so that exhibitions of this kind ceased to be popular, and sunk into neglect. At a later period, the death of one of the combatants served to render them still more disreputable, and unworthy of any patronage and encouragement. Instances, however, are often occurring of the renewal of these contests; but they are now so disgraceful in the public estimation, and so much restrained and prohibited, by the interference of the magistrates, that they are attended by few persons above the lowest classes of the community, whenever, by cluding notice, they happen to take place.

BOXING, an operation in sailing, somewhat similar to box-hauling. It is performed by laying the headails a-back, to receive the greatest force of the wind in a line perpendicular to their surface, in order to bring the ship's head back into the line of her course, after she had inclined to windward of it, by neglect of the person at the helm, or otherwise. But should a ship be taken flat a-back, or through neglect in not timely boxing her off, it should cause the wind to be broad upon the other bow, and it would be the wish of the officer to have her upon the same tack as before, then heel the helm over to that side, which just before was the weather; sail up the mizen, and mizen stay-fall; raise the main-tack and sheet, and square the after-yards. In this situation of the helm and sails, the will pay round off upon her keel; and when she has brought the wind aft, and gathered head-way, shift the helm. The wind round upon the other quarter, haul aft the mizen and mizen stay-fall sheets, brace up the after-yards, get on board the main tack, and haul all the sheet. As she comes to, right the helm, and trim sharp as before.

BOXING, in Ship-building, the projection left on the haft-pieces, in the wake of the haft-holes, where the planks do not run through.
Boxing is also used for the tapping of a tree, to make it yield its juice.

The boxing of maple is performed by making a hole with an ax or chisel into the side of the tree, about a foot from the ground; out of it flows a liquor from which sugar is made. Phil. Trans. No. 364. See Maple, Bending, Birch, and Saw.

BOXMEER, in Geography, a town of Germany, situated on the river the Maas, on the frontiers of the dukedom of Guelders: 8 leagues E. of Deers-duc, and 4 S. W. of Cleve.

BOXTEHUDE, a town of Germany, in the circle of Lower Saxony, and duchy of Brunswick, on the river Elbe or Oa, navigable for boats to the Elbe. It is subject to the Danes; 14 miles W. of Hamburg. N. lat. 51° 46'. E. long. 9° 35'.

BOXTEL, a town of Brabant, on the Dongael, and furnished with sluices; 5 miles S. of Deers-duc. N. lat. 51° 38'. E. long. 5° 17'.

BOY-BISHOP, in Antiquity. See Bishop.

Boy, in Geography, a town in Spain in the province of Catalonia; 6 miles S. W. of Barcelona.

BOYAR, or BOB, a term used for a Russian lord, or grandee. According to Becman, boyars are what, in other countries, are called the upper nobility: he adds, that the czar of Muscovy, in his diploma, names boyars before waywodes.

It has not yet been satisfactorily determined, what the ancient boyars were; whence they derived their descent; and how they maintained their dignity; and whether this dignity was conferred by the sovereign; whether it attached to birth, or whether it sprang from the rank and importance which they brought with them into the country. If we consider them as the privy councillors of the sovereign, then their precedence arises merely from their office, or they must have possessed it by their birth. But it has been likewise affirmed, that the boyars, now in general the most considerable of the Russian nobility, came from abroad, were sprung from foreign ancestors, and brought their nobility into the empire with them. However, future researches are necessary for obtaining satisfaction, with regard to these questions. During the Tartarian and Mongolian sovereignty, no trace of them is found; and even during the reign of czar Ivan Vaclilevitch I. no such title appears, though it seems to have arisen at that time, or very soon after it: for, under the czar Ivan Vaclilevitch I., the boyars had already endeavoured to collect a considerable force; but were much overawed by that monarch. In the succeeding period of diffraction, occasioned by the aspiring views of the patriarch and his superior clergy, the boyars seized the favourable opportunity of extending their power. It is also probable, that persons of respectable birth from other countries, who occupied high stations in Russia, and on this account, as well as from the privileges brought with them, enjoyed great authority; and hence all boyars, i.e. the superior officers, might take occasion to assume a consequence, which they afterwards, as opportunities occurred, endeavoured to enlarge. Although the boyars are always mentioned in history as persons of distinction, yet the same history also informs us, that they received their dignity from the sovereign alone, that it was entirely personal, and that it was not transmitted by inheritance from father to son. Accordingly, it depended on the will of the monarch, whether he would have many or few boyars: and, therefore, they can never be considered as native privileged deputies of the people, nor as perons who could restrain the power of the sovereign, or refuse him in the undue exertions of it. In some cases, however, they usurped an authority to which they had no pretensions, and then brought great discontents upon the empire. At the drawing up of the ulorrhonic, or old law of the land, they, as well as the clergy, were consulted; but probably only as privy councillors, under which description they were generally noticed in the ukases. However, in order to prevent any further usurpation and mistake, an order was issued in 1701 by Peter I., that they should no longer be mentioned at all in the ukases. From the authority they possessed, and with a natural desire of extending it, it may be reasonably presumed, that they took a lead in the elections of the sovereign princes, if they were not the prime managers of them; they without doubt thought themselves the first preferments after the sovereign and the privileged representatives of the people, especially of all the rest of the nobility; and this seems to be the reason why the latter are not named among the electors. The boyars, in early times, when wars were frequent, besides having a share in the election, were commanders of the army, as well as the ministers and counsellors of the prince. The directing senate in the Russian government, instituted by the emperor Peter I., about the year 1711, and raised to the rank of the supreme college of the empire, consisted of 9 boyars; and seems to have been created in the place of the old boyars. The boyars before his time sat at the helm of state in the capital, and officiated as viceroys in the provinces, deciding, commanding, and acting, according to their own humours. But he abrogated the court of boyars, called "boyarkoi dvor," which had hitherto constituted the ministrily of the czar or tsar, and without whose consent nothing could be enacted, inasmuch that all the decrees of government began with these words, "By command of the tsar, and with the approbation of the boyars;" and substituted the senate in its room. Writers are not agreed as to the precise meaning of the word "boyar" or "boyarin." In the dictionaries it is made to denote a lord, a person of quality, or a nobleman. Sometimes it peculiarly denotes a soldier. In the Russian language, "boyarin" signifies a gentleman, a person of distinction, or a member of a family: and the Russian peasant usually styles his nobleman, even though he has neither rank nor citze, boyarin, or contracledly, barn, and his spouse, boyarina. Hence the last-service, performed by the boyars to their lord, is called "boyarichtchina." Tookese's view of the Russian empire, vol. ii.

BOYAU, in Fortification, a branch of the trenches; being a ditch covered with a parapet, which forms a communication between two trenches; it runs parallel to the defensive works of the body of the place, and serves as a line of contravallation, to hinder the falls of the besieged, and also to secure the miners. When it is a line or cut, that runs from the trenches to cover some spot of ground, it is drawn so that it may not be enfiladed, that is, that the shot from the town may not nose along it.

BOYCE, Dr. William, in Biography, organist and composer to his majesty, was a musician to whom our choral service is greatly indebted, not only for his own excellent choral works, but for the well selected, correct, and splendid edition of our cathedral music, which he published in three volumes large folio, upon the plan, and at the recommendation of his master and predecessor, Dr. Greene, to whom he served an apprenticeship.

This eminent professor (Boyce) was born at Joyner's hall, in the city, of which his father was housekeeper, and with whom he resided during his youth. When he became a family man, his residence was at Chancery-lane, to the end of the reign.
BOY

reign of his late majesty George II., about which time he returned to Kennington Gore, where he ended his days in 1779. He was educated at St. Paul’s school, and began his musical career as a chorister in that cathedral. When he left his treble voice, he was bound apprentice to Dr. Greene, then organist of the metropolitan church. The matter and scholar seemed worthy of each other, living in the utmost cordiality and friendship; the matter loving the pupil, and the pupil honouring and respecting the matter, to the end of their lives.

In 1734, he was a candidate for the place of organist of St. Michael’s church, Cornhill, with Frood, Young, James Worgan, and Kelway. But though he was unsuccessful in this application, Kelway having been elected, yet he was appointed, the same year, to the place of organist of Oxford chapel; and in 1736, upon the death of Weldon, when Kelway, being elected organist of St. Martin’s in the Fields, resigned his place at St. Michael’s Cornhill, Boyce was not only elected organist of that church, but organist and composer in the chapel royal.

The same year he set “David’s Lamentations over Saul and Jonathan,” which was performed at the Apollo Society. About the year 1743, he produced his oration of “Solomon,” which was not only long and justly admired, as a pleasing and elegant composition, but still affords great delight to the friends of English music, whenever it is performed. His next publication was “Twelve Sonatas or Trios for two Violins and a Basso,” which were longer and more generally purchased, performed, and admired, than any productions of the kind in this kingdom, except those of Corelli. They were not only in constant use, as chamber music, in private concerts, for which they were originally designed, but in our theatres, as aëst tunes; and public gardens, as favourite pieces, during many years.

In 1749, he set the ode written by the Rev. Mr. Mason, for the installation of the late duke of Newcastle, as chancellor of the university of Cambridge, at which time he was honoured with the degree of doctor in music by that university. Soon after this event he set the “Chaplet,” a musical drama, written by the late Mr. Mendez, for Drury-lane theatre, which had a very favourable reception, and continued many years in use among the street pieces for that theatre. Not long after the first performance of this drama, his friend Mr. Beard brought on the same stage the following ode, written by Dryden, and originally set by Dr. Boyce for Hickford’s room, or the Caille concert, where it was first performed, still life. This piece, though less successful than the “Chaplet,” by the animated exertions of Mr. Beard, was many times exhibited before it was wholly laid aside. These compositions, with occasional fuge songs for Vauxhall and Ranelagh, diffused the fame of Dr. Boyce throughout the kingdom, as a dramatic and miscellaneous composer, while his choral compositions for the king’s chapel, for the feast of the fons of the clergy at St. Paul’s, and for the triennial meetings at the three cathedrals of Worcester, Hereford, and Gloucester, at the performances in all which places he constantly professed till the time of his death, established his reputation as an ecclesiastical composer and able master of harmony.

Dr. Boyce, with all due reverence for the abilities of Handel, was one of the few of our church composers who neither pillaged nor fervishly imitated him. There is an original and shining merit in his productions, founded as much on the study of our own old masters, as on the best models of other countries, that gives to all his works a peculiar stamp and character of his own, for strength, clearness, and facility, without any mixture of fyles, or extraneous and heterogeneous ornaments.

On the decease of Dr. Greene, in 1757, he was appointed master of the king’s band, and, in 1758, on the death of Travers, organist of the chapel royal; of which he had succeeded Weldon, in 1736, as composer: so that he enjoyed three honourable appointments at once, which used to be supplied by three several professors. The grant put an end to the existence of this worthy man, and excellent composer, at the age of 69. He was succeeded in the chapel royal by Mr. (afterwards Dr.) Dupuis, and, as a master of his majesty’s band, by Mr. Stanley.

BOYD, MARC ALEXANDER, a descendant of the ancient family of this name in Scotland, was born in Galway, in 1762, and placed for education at Glasgow, under the care of his uncle, the archbishop. But being of an un governable and turbulent temper, he quarrelled with his preceptors, destroyed his books, and renounced the pursuits of literature. He then fought to pursu his interest at court, and when all the endeavours of his friends to serve him in that situation proved ineffectual, they lost him in a military capacity to the wars of the United Provinces, with a view of restraining the violence of his temper. From hence he soon removed to Paris, and left his whole stock of money by gaming. The diffigs that ensued seems to have brought him to reflection, and he determined to apply to literary studies. Accordingly he repaired to Bourges, and attended the lectures of the famous civilian Cujaeus. To this eminent professor he recommended himself by peculiar attention and respect, and by adopting his taste in Latin poetry; and thus he acquired a fondness for the antiquated style of Ennius, and of the other Latin poets. From Bourges he was driven by the plague to Lyons, and thence to Italy. On the renewal of the civil wars in France, he removed thither, and bore arms with reputation in the royal cause; and after a variety of adventures he returned to his native country, where he died in 1601.

The talents and performances of Boyd have been much over-rated; and he has been represented as another “admirable Crichton.” But though he possessed a vigorous and versatile genius, he never acquired, probably on account of his indolence and diffidence, any kind of dis tinguished excellence. Besides several manuscripts which he left behind him, on political, critical, and poetical topics, his “Epitola Heroidum,” and his “Hymni,” were published in the “Delicia Poetarum Scotorum”; printed at Amsterdam, in 2 vols. 4to., 1678. His “Epitola” were referred to James VI. of Scotland, or James I. of England, whom he represents as superior to Pallas in wisdom, and Mars in arms. As to the character of his poetry, it confests in an imitation of the wit of manner of Ovid; and his hymns, which have no tincture of devotion, are poems to which he has annexed the title of some flower or herb, the qualities of which he has described. Bishop Tanner informs us, that, besides his epistles and hymns, he published two books of “Epigrams.” 8vo, Brit.

BOYDELL, JOHN, a liberal patron of the arts, and an honour to his country, was born at Dorrington, in Shropshire, on the 17th of January 1719. His father, who was a land surveyor, intended his son for his own profession; and, had it not been for one of those little accidents which often determine the path that men are destined to walk, he had waited that time, which has been so honourable to himself, and beneficial to this nation, in measuring and valuing the acres of Shropshire squires, and the mansions of Welch baronets. Fortunately for himself and the arts, a trifling incident gave a different direction to his mind, and led him to aim at the delineation of scenes more picturesque than the ground

X 2
plans of houses, boundaries of fields, or windings of obscure roads. While he was yet very young, chance threw in his way Baddeley’s Views of different Country Seats; and among them was one of Hawarden castle, Flintshire; which being the seat of Sir John Glynn, by whom he was then employed in his professional capacity, and in the parish of which his father was an inhabitant, naturally attracted his attention. An exact delineation of a building that he had often contemplated, afforded him pleasure, and excited an inclination easier to be conceived than deferved. Considering it as an engraving, and reflecting that from the same copper might be taken an almost indefinite number of impressions, he determined to quit the pen, and take up the graver, as an instrument which would enable him to delineate whatever work he could produce, in so much wider a circle. This resolution was no sooner made, than it was put in execution; for, with that spirit and perseverance which he manifested in every succeeding scene of life, he, at twenty-one years of age, walked up to the metropolis, and bound himself apprentice for seven years to Mr. Toms, the engraver of the print which had so forcibly attracted his attention. These, and accidents equally trilling, sometimes attract men of strong minds into the path that leads direct to fame, and have been generally considered as proving that they were born with some peculiar genius for some peculiar study; though, after all, genius is perhaps little more than what a great moralist has defined it:—“a mind with strong powers accidentally directed to some particular object.” Sir J. Reynolds had the first fondness for his art excited by the perusal of Richard’s Treatise on Painting; and, as we have before observed, Mr. Boydell was induced to learn the art of engraving, by a coarse print of a coarse artist, representing a mis-shapen Gothic castle.

His conduct, during his apprenticeship, was eminently affinuous. Eager to attain all possible knowledge of an art on which his mind was bent, and of every thing that could be useful to him; and impelled by an industry that seemed inherent in his nature, he, whenever he could, attended the academy in St. Martin’s Lane to perfect himself in drawing; his leisure hours in the evening were devoted to the study of perspective, and to the learning of French without the aid of a master. After very steadily pursuing his business for six years, and finding himself a better artist than his teacher, he bought from Mr. Toms the last year of his apprentice ship, and became his own master; and the first use that he made of his freedom was to return into his own country, where he married a very deserving young person of a most respectable family, to whom he had an early attachment, and with whom he lived many years in great felicity.

In the year 1745, or 1746, he published six small landscapes, designed and engraved by himself. This publication, from his having, in most of the views, chosen a situation in which a bridge formed part of the scenery, was entitled “The Bridge-Book,” and sold for a shilling. Small as this sum was, he sometimes spoke with apparent pleasure of a silver snuff-box in Duke’s-court, St. Martin’s-lane, having sold so many, that when he settled his annual account, he thought it would be civil to take a silver pinter mug in part of payment, and this mug he retained until his dying day. He afterwards designed and engraved many other views, generally of places in and about London, and published the greater part of them at the low price of one shilling each. But, even at this early period, he was so much alive to fame, that after having passed several months in copying an historical picture of Coriolanus by Sebastian Conca, he so much disliked his own engraving, that he cut the plate to pieces. Befide these, he engraved many prints from Brockling, Berlin, Salvator Rosa, &c. The manner in which many of them are executed is highly respectable; and, being done at a time when the artist had much other business to attend to, displays an industry rarely to be paralleled, and proves, that had he devoted all his time to engraving, he would have ranked high in the profession. His facility of execution, and unconquerable perseverance, having thus enabled him to complete 152 prints, in 1750, he collected the whole in one port-folio, and published it at five guineas. He modestly allowed, that he himself had not at that time arrived at any eminence in the art of engraving; and that those prints are now chiefly valuable from a comparison of them with the improved taste of the art within the last 50 years. In fact, there were at that time no eminent engravers in England; and Mr. Boydell saw the necessity of forcing the art by stimulating men of genius with suitable rewards. With the profits of the folio volume of prints above mentioned, he was enabled to pay very liberally the bell artists of his time, and thus presented the world with English engravings from the works of the greatest masters. The encouragement that he experienced from the public was equal to the spirit and patriotism of his undertaking, and soon laid the foundation of an ample fortune. He used to observe, that he believed the book we have alluded to was the first that ever made a lord mayor of London; and that when the final stages of the work was compared with what had followed, it would impress all young men with the truth of what he had often held out to them, that industry, patience, and perseverance, if united to moderate talents, are certain to mount all difficulties.” Mr. Boydell, though he never himself made any great progress as an engraver, was certainly the greatest encourager of the art that this country ever knew. English engravings, which were before considered as extremely inferior to those of foreign nations, began from that time to be highly prized; and the exportation of them soon became a valuable article of commerce. On the 5th of August, 1782, Mr. Boydell was chosen alderman of London, for the ward of Cheap, in the room of alderman Crichton, deceased.

Having been so successful in promoting the art of engraving in this country, he resolved to direct his next efforts to the establishing of an English school of historical painting; and justly conceiving that no subject could be more appropriate for such a national attempt, than England’s inspired poet, and great painter of nature, Shakspeare, he projected, and just lived to see completed, a most splendid edition of the works of that author, illustrated by engravings from paintings of the first artists that the country could furnish, and of which the expense was prodigious. These paintings afterwards formed what was termed “The Shakspeare Gallery,” in Pall Mall; and we believe there are few individuals, possessed of the least taste, or even curiosity, who have not inspected and been delighted by them.

In the year 1790 Mr. Boydell was chosen lord mayor of London; an office, of which he discharged the duties and the honours with a diligence, uprightness, and liberality, that may be equalled, but will rarely be exceeded.

After having expended, in his favourite plan of advancing the fine arts in England, no less a sum than 350,000l. this worthy and venerable character was incessitated, by the floppage of his foreign trade during a dozen years of war, to apply to parliament, in the beginning of 1804, for permission to dispose of the Shakspeare gallery, and his other collections of pictures and prints, by way of lottery. His letter to Sir John William Anderson, bart., on the occasion of his introducing a petition for that purpose to the house of commons, is preserved in most of the respectable periodi-
infectious fever was making great ravages, and, in 1742, to Paris, on a similar occasion. His successes at these places occasioned him to be sent for to Beauvais, in 1759, where by his judicious management he prevented the spreading of an infectious fever, infesting that country. For these services he was honoured by the king with letters of nobility, and invested with the order of St. Michael. He died Jan. 1768. His works are "Methode indiquée contre la maladie epidémique qui vient de regner a Beauvais," Paris, 1759, 4to. It consists of only ten pages. "Methode a suivre dans le traitement des différentes maladies epidémiques qui regnent le plus ordinairement dans la générale de Paris," 1761, 12mo. He wrote, in 1745, a "Memoire" on the disease infecting the cattle at that time. It was sent to the Royal Society in London, and procured him a place in the list of their foreign members. He also gave a new edition of the Codex medicamantarius," feu "Pharmacopoeia Parisiensis," 1750, a very useful and well digested work. Eloy, Dr. Hill.

Boyer's Day, in Geography, lies at the N.W. end of the island of St. Kitts, in the West Indies.

Boyer, in Navigation, a kind of Flemish sloop, or small vessel of burden, having a boltspit, a cleft at each end, and a tall mast; chiefly fit for the navigation of rivers, and, in many of its parts, resembling a smack. The boyer has a double bottom, and a forked mast, that it may run better with the bowing-line, without driving.

BOYERA, in Geography, a village of Africa, in the kingdom of Ameta, on the Gold coast, situate between Bomtry and Tekorari, and wholly inhabited by fishermen and labourers, who carry on a considerable trade with their neighbours by exchanging the fruits of the earth and fish for the produce of other countries. This village, and an adjoining one, called "Pandos," of the same description, are known at sea by a large pointed rock that lies before the coast.

BOYES, an order of American priests or magicians, used by the savages for calling up their gods, either to be re-engaged on those who have done them any injury, or to be cured of some disease, wherewith they are inflected, or to drive out some devil. They are also consulted with regard to the event of their wars. Each boyo has his peculiar duty; who is invoked by certain forms of words, tending in a quantic tone, accompanied with the fumes of tobacco.

BOYEPECANGA, in Zoology, the name of a very large serpent, distinguished by this name on account of certain prominences on its back. It is a very large and remarkably thick serpent, and of very fatal poison. Ray.

BOYE, RICHARD, in Biography, an accomplished statesman, generally liked the "Great Earl of Cork," was the descendant of an eminent and honourable family in Herefordshire, and the second son of Roger Boyle, a younger brother, who settled at Canterbury, where he was born in 1565. Having pursued his studies for some time at Benset college in the university of Cambridge, he removed to the Middle Temple with a view to the profession of the law; but he soon changed his determination, and entered into the service of Sir Richard Manwood, chief baron of the exchequer. This situation presenting him no prospect of speedy advancement, he went to Dublin in 1585; and, though his whole wealth amounted only to 27l. 3s. he had good recommendations, which, together with his own talents, introduced him into connection with the principal persons employed in the government, to whom he rendered himself eminently useful. The business in which he was engaged afforded opportunities of acquiring a comprehensive and accurate knowledge of the kingdom, and of the state of public affairs, which he did not neglect duly to improve. His marriage also, in 1588, with
with a heavy polluting $500, per annum of landed property, for the purpose of accelerating his advancement. By several advantageous purchases, at a time when land was of precarious tenure, and consequently cheap, he laid the foundation of his future ample estate; and the office of clerk of the council, under Sir George Carew, in the province of Munster, to which he was appointed by Queen Elizabeth, served to give him additional importance. His constant attendance on Sir George in all his expeditions against the Irish rebels, offered him various opportunities of singular service to the state; and of justifying the confidence that was reposed in him. Accordingly, after the battle of Kinsale, A.D. 1601, in which the Irish and their Spanish auxiliaries were totally routed, he was dispatched by his patron, the president of Munster, to communicate the news of the victory to the queen; and he executed this commission with such dispatch, and so much to the satisfaction of Sir George, that he was employed in another embassy to England, in order to obtain the queen’s permission for the president’s return to his own country.

In consequence of the advice of his patron, Mr. Boyle purchased, at a low rate, Sir Walter Raleigh’s estate in Ireland, consisting of 12,000 acres, in the counties of Cork and Waterford, which he consolidated and improved as much as to enhance their value. In 1603 he married the daughter of Sir Geoffrey Fenton, and in the same year received the honour of knighthood from his friend and patron Sir G. Carew, then lord deputy of Ireland. The next step in his progressive advancement to the high honour and ample fortune, which he afterwards acquired, was the office of privy-councillor for the province of Munster, to which he was appointed by King James in 1665; and as he had considerable estates in this province, he was enabled, by this promotion, to pay due attention, at the same time, to his own interest and that of the public. With a view to both these objects, he took care to let his estates to English protestants only, and to erect several towns and boroughs, as well as some castles, for their security. His conduct was so much approved, that in 1613 he was promoted to the dignity of privy-councillor for the kingdom of Ireland, and in 1616 to the rank of peerage, by the title of baron of Youghall, in the county of Cork, and in 1620 to that of viscount Dungarvan and earl of Cork. By his active and unremitting exertions for promoting the security and prosperity of the English and protestant interest in Ireland, and improving the arts and manufactures of the country, he conciliated the favour of King Charles I., and obtained for his sons, even in their infancy, several titles of distinction. As they grew up he settled them in separate estates, and formed connections for his daughters with the best families in the country. At the castle of Lifmore, the centre of very ample domains, which on this account he chose for his own residence, he lived in a style of princely splendour. In 1629 he was appointed one of the lords justices of Ireland; an office of high dignity and influence, which he held for many years; and in 1631 he was appointed lord treasurer of the kingdom, accompanied with the unprecedented circumstance of hereditary succession in his family. But it has not continued in the sole line of the house of Boyle; for, on the death of the last earl of Burlington, in 1753, the office was conferred by his late majesty, on the then marquis of Hertingston, who was not of the Boyle family; and it is now enjoyed by his son, the present duke of Devonshire, who descends from a female branch. In the exercise of the powers with which he was invested, he affidavily executed the rigorous laws of queen Elizabeth against the papists; and for the more effectual suppression of the popish religion and worship, he shut up several mas-houses both in Dublin and in the country.

He was also active in providing a regular and competent subsistence for the army; and in transplanting a multitude of barbarous Irish "feets," or "clans," out of the fertile and well cultivated province of Leinster, into the wilds and deserts of the county of Kerry. He also took great pains in endeavouring to procure a mint to be settled in that county. Upon the arrival of lord Wentworth, who was appointed lord-deputy of Ireland in 1633, the high powers possessed and exercised by the earl of Cork excited jealousy and opposition; and the cold civilities which at first prevailed between them terminated in open and avowed hostility. This hostility continued for several years; every man striving to the mortification and dishonour of both parties. However, when the earl of Strafford was impeached before the house of lords in 1641, the earl of Cork, who was then in England, had an opportunity of retaliating by giving evidence against him.

Soon after this event, and just before the commencement of the great rebellion in that country, he returned thither; and affuming a military capacity, exerted himself with all the ardour of youth, and collected an army among his tenants and dependants, at his own expense, which he committed to the command of his four sons, distributing them through various parts of his extensive dominions, so as to secure them, in a great degree, against the depredations of the superior forces of the Irish, and to gain many advantages over them. In this contest he lost one of his sons, who fell at the battle of Liscarrag in 1642; nor did the earl himself, whose active exertions overpowered a constitution already impaired by age, long survive. In September 1643 he closed his honourable career of private advancement and public service, and was interred in his own chapel, in the parish church of Youghall, near the noble monument he had erected for his family. How well he deserved the title of the "Great earl of Cork," under which appellation he is always mentioned, even among the native Irish, the historians of the interesting period in which he lived have amply testified. "The noble earl of Cork, lord high-treasurer," says Sir Richard Cox, an intelligent and impartial writer, in his introduction to the 2d volume of his History of Ireland, "was one of the most extraordinary persons, either that or any other age hath produced, with respect to the great and just acquisitions of estate that he made, and the public works that he began and finished, for the advancement of the English interest and the protestant religion in Ireland, as churches, alms-houses, free-schools, bridges, canals, and towns, viz. Lifmore, Tallow, Cloghinakelly, Inskine, Collatown and Bandon, (which last place cost him fourteen thousand pounds), infirmum that when Cromwell and his prodigious improvements which he little expected to find in Ireland, he declared "that if there had been an earl of Cork in every province, it would have been impossible for the Irish to have raised a rebellion." And whilst he was carrying on these solid works, he lived in his family at a rate of plenty that exceeded those who confounded great estates in the lavish ways of ill-ordered excess. His motto, "God’s providence is my inheritance," shews from whence he derived all his blessings, the greatness of which was the numerous and noble posterity he had to leave his estate unto." By his second lady he had fifteen children, of whom many survived him, and rose to great eminence. [Boyd. Brit.]

**Boyle, Roger, earl of Orrery, fifth son of the great earl of Cork,** was born in 1621, and created baron Brockhill, of the kingdom of Ireland, at the age of seven years. At Dublin, where he received his education, he was distinguished by his genius and application; and, in 1636, he sat out on the tour of France and Italy. Upon his return from his travels, he found the country in great confusion; and
and having married the daughter of the earl of Suffolk, they landed in Ireland on the day when the rebellion in that kingdom broke out, viz. October 23, 1641. On this occasion the post which his father assigned him was the defence of the castle of Lismore, in which he behaved with equal prudence and courage. After the cessation of the contest between the prelates and papish parties in Ireland, he visited England, and paid his respects to King Charles I. at Oxford; to whom he communicated information concerning the true state of Ireland; and he returned with a commission to Lord Inchiquin, and instructions to act against the rebels, in which service he acquitted himself to the utmost of his power; and he continued his service, as the only means of promoting the Protestant interest, under the commissioners named by parliament, till the king's death. When this event took place, he left his country and retired to Marlon in Somersetshire, where he remained for some time in close retirement; but here he formed a scheme of crossing the sea, under a pretence of visiting the Spue, on account of his health, and of applying to Charles II. for a commission to raise forces in Ireland, for the restoration of his majesty and the recovery of his own estates. The committee of state, however, were apprized of his design; and Cromwell, wishing to avail himself of his talents and influence, proposed an interview with him. In this interview he was informed, that the committee of state knew the object of his leaving the kingdom, and that they had determined to make an example of him, if he himself had not interfered and diverted them from their purpose. Lord Broghill, finding that it was vain to dispense, and that Cromwell had copies of several letters which his lordship had sent to theob in whom he had confided, and which he put into his hands, returned Cromwell thanks for his protection against the committee, and solicited instructions how he was to act in this peculiarly delicate and embarrassed circumstances. Cromwell assured him of the high opinion he entertained of his merit and character; and, as he had been appointed lord lieutenant of Ireland, he informed him, that he had obtained leave of the committee to offer his lordship the command of a general officer, if he would serve in the war for reducing the country; pledging himself at the same time, that no oaths or engagements would be imposed upon him, and that he should not be obliged to draw his sword against any but the Irish rebels. Whilst his lordship was hesitating about accepting an offer so generous and unexpected, Cromwell urged the necessity of an immediate resolution; as the committee, who were then sitting, determined, if he refused the offer, to send him to the Tower. Lord Broghill, apprehending danger both to his liberty and life, and overpowered by the apparent frankness and generos ity of Cromwell's conduct, gave him his word and honour, that he would faithfully serve him against the Irish rebels. Accordingly he directed him to repair immediately to Bristol, where he would find a supply of forces, and a sufficient number of ships to transport him into Ireland. Having accepted Cromwell's commission, he served under him with great military skill and vigour in his Irish campaigns. After Cromwell's assumption of the protectorate, lord Broghill became his constant companion and confidential counsellor; and it has been said, that he proposed a matrimonial connection between the exiled king, Charles II. whom he had founded upon it, and whom he found not altogether averse from the project, and France, the daughter of the protector, who was not inclined to adopt it. It has also been said, that he advised Cromwell to restore the old constitution, and to assume the title of king. The measures he recommended, whilst he enjoyed the confidence of the protector, were mild and lenient; and by these he equally served both Cromwell and the nation. In parliament he opposed and defeated the detestable measure, proposed by some party-men, which was that of a law for deeming the royal party. In 1656, lord Broghill accepted, on conditions previously stipulated, a commission to govern Scotland for one year with absolute authority; and in the execution of it he gave great satisfaction both to the Scots and to Cromwell. It redounds much to the credit of his lordship's judgment, that, notwithstanding the number and influence of his enemies, and their frequent access to the protector, he retained his confidence to the last, and performed some of the most distinguished public acts under his government, being a general officer in the army in Ireland, a member of both parliaments, a lord of Oliver's creation, and one of his confidential council. After the death of Cromwell he adhered faithfully to his son Richard, as long as he had any prospect of maintaining his power; but as soon as he had dissolved the parliament, he thought the government subverted, and himself absolved from all obligations of attachment to the Cromwell family, considered as that of a prince. He, therefore, determined, for his own security, to withdraw to Ireland, and to assume his command in the province of Munster. Availing himself of the advantages which his situation afforded him, he was eminently useful in restoring and re-establishing the king's authority in Ireland; and soon after his arrival, he came over to England, and further ingratiated himself with his majesty, by giving him full information with regard to the state of parties in Ireland. For the services that were rendered by him on this occasion, he was advanced, in 1662, to the dignity of earl of Orrery, and appointed one of the lords justices for Ireland. Having drawn up the act of settlement for that kingdom, and thus secured the Protestant interest, he withdrew in 1665, upon the appointment of the duke of Ormond to the lieutenantcy, to his local jurisdiction in the province of Munster. In this situation of subordinate authority, and comparative retirement, and though he was occasionally afflicated with paroxysms of the gout, he took an active part, when opportunity offered, in public affairs. He is said to have had the feals offered him, when he made a visit to England in 1665, but he declined accepting them. On his return to Munster, he found ample employment for his talents during the progress of the Dutch and French war. Besides other services of an important nature which he performed, he put the town and harbour of Kinfaule into such a state of defence, as to relieve the people amidst their alarms and apprehensions, and to render abortive the scheme for seizing it projected by the admiral of the French fleet. To him it was owing, that this port became afterwards a commodious refuge in time of war, both for our East and West India fleets. Notwithstanding all his labours and services for the safety of the kingdom, an unhappy dispute arose in 1667, between him and the duke of Ormond; so that he was deprived of his preludential power in Munster, and a charge of high treason was preferred against him in parliament, but it produced no effect. He still retained the king's esteem and confidence; though he was incapable of rendering him any essential service. Accordingly he determined to spend his latter years in Ireland, and to devote himself to literary pursuits, to the improvement of his estates, to the encouragement of manufactures, and to the support of the Protestant interest. He closed his life, much respected by his domestics and tenants, and generally esteemed, October 16, 1679. As a statesman and soldier the earl of Orrery appeared with singular advantage; but though he was ambitious of obtaining the reputation of a writer, and published a great number of works, in prose and verse, tragedy, comedy, and romance, &c. none of them...
them have escaped oblivion. As a patron and encourager of literature, he has been mentioned with respect and applause. 

Boyle, Robert, an eminent philosopher, illustrious by birth, learning, and virtue, was the 7th son of Richard, Earl of Cork; and born at Lismore in the county of Cork, February 25th, 1625-7. In his infancy he was committed to the care of country nurses, with instructions to bring him up hardly, as if he were her own son; and he thus acquired a strong and vigorous constitution, which was afterwards emboldened by too tender treatment. About the age of five years, he lost his mother, whom he mentions with great respect; and whilst he was under the care of his nurses he acquired, by imitating some children of his own age, a habit of fluttering, which was never entirely cured. In his father's house he was taught to write a fair hand, and to speak both French and Latin; and at this early period he manifested a docility and an invariable regard to truth, which very much endeared him to his father, and formed distinguishing features of his character in the progress of his life. In 1635, when he was about eight years of age, he was sent to Eton college, of which Sir Henry Wotton was then provost, and placed under the care of Mr. Harrison, to whose attention and judicious mode of instruction he acknowledged himself indebted for those habits of assiduous investigation in which he afterwards excelled. At Eton he was afflicted with an ague, which rendered it advisable to divert his attention from the course of study which he was pursuing, and to allow him to seek that kind of amusement, which the perusal of romances might afford him; but though he was only 10 years old, he was sensible of the injury produced by this kind of detestatory reading; and as soon as he regained his health, he sought a remedy for this evil in the severer studies of mathematics and laborious calculations. After having spent between 3 and 4 years at Eton, he was placed under private tuition for the recovery of his knowledge of the Latin language which he had nearly lost; and in 1638 he accompanied his brother Francis on his foreign travels, under the care of Mr. Marcomes. In their route they passed from Dieppe to Rouen, Paris, and Lyons, and at length settled at Geneva, where they were directed to remain and to pursue their studies. The principal objects of Mr. Boyle's attention were mathematics, in the prosecution of which he found great pleasure; but besides these, he employed himself in the study of rhetoric, logic, and political geography, and in acquiring the external accomplishments of fencing, dancing, &c. At this time some incidents happened, which concurred with his naturally serious disposition to direct his thoughts to the subject of religion; and in examining the evidences of the chrisitian revelation, he obtained full satisfaction, notwithstanding the doubts and difficulties which had occasionally perplexed his mind; and was confirmed, in his belief of its truth and importance. Having remained a year and three quarters at Geneva, he left it in September 1641, and traversing various parts of Italy and Lombardy he arrived at Venice; and from Venice he proceeded to Florence, where he spent the winter. During his residence in this city, he acquired a knowledge of the Italian language; and employed a great part of his time in reading modern history; and in acquainting himself with the new discoveries of Galileo, who died in the vicinity of Florence at the period of Mr. Boyle's abode in this city. Towards the end of March, 1643, he commenced his journey to Rome, visiting the most remarkable places in his route thither; and from Rome, where his stay was short, he returned to Florence, and from thence he passed to Leghorn, and afterwards to Geneva. Having travelled through the country of Nice, and crossed the sea to Antiques, he proceeded to Marseille, where he expected bills of exchange; but, to his great mortification, he found a letter from his father informing him and his brother, that the rebellion had broke out in Ireland, and that it was with considerable difficulty that he had been able to procure for them a remittance of 250l. in order to defray their expenses in their return to their own country. But through the negligence of the person, to whom the remittance was entrusted, they received no part of this money, and were, therefore, left in a destitute condition. At Geneva, whither they were enabled to proceed by the assistance of Mr. Marcomes, their governor, they waited two years without receiving any supplies; and by the dishood of some jewells which they took up on his credit, as they proceeded on their journey homeward, their travelling expenses were defrayed, and they arrived safe in England about the middle of the year 1645. On their arrival they received the news of their father's death; but Mr. Boyle was amply provided for by the bequest of the manor of Stalbridge in England and other estates in Ireland; and yet on account of the confusion of the times, he was for some months unable to procure any money. However he was relieved on his arrival by his sister the lady Kanelagh; and by her interest, and that of his brother lord Broughill, his English and Irish estates were secured for him. He also obtained leave to go to France; and having settled his accounts with Mr. Marcomes, he soon returned. In March, 1645, he retired to his manor of Stalbridge, and for 5 years devoted himself to various kinds of literary and scientific pursuits in this place; and more particularly to the study of natural philosophy and chemistry. During this period of retirement, when he was about 20 years of age, he commenced that extensive correspondence with the principal persons of his time, which he maintained, with distinguishing reputation to himself and benefit to the world, till near the close of his life. In the list of his religious and literary friends and correspondents, we may enumerate Mr. Francis Talents, afterwards known to the world as the author of the "Chronological Tables;" Mr. Samuel Harthib, whom he greatly esteemed, and who is mentioned with peculiar commendation by Milton in his "Tractate of Education;" Dr. William Petty; Mr. John Beale, besides many others. At this early age he manifested his zeal for religion, as well as his candour and christian charity, by favouring the designs of Mr. John Druyer, for effecting a reconciliation between the Lutherans and Calvinists. He was likewise one of the first members of that learned body, which, after the restoration was incorporated under the title of the Royal Society. Notwithstanding the dislike of the throne, with which he was afflicted, and numerous avocations which his various connections imposed upon him, his application to study was assiduous and indefatigable; and before he had attained the age of 20, he had completed three treatises, viz. "Seraphic Love," "An Essay on the Motion of Cold," and "An Essay against the Coexistence of Causes." Mr. Boyle was distinguished as a promotor of literature and science, by his patronage of others engaged in similar pursuits, as well as by his own labour and writings. Accordingly in 1651, Dr. Nathanial Highmore, an eminent physician, dedicated to him his "History of Generation," which was a laborious work at that time much esteemed. When he was unerring in his chemical and philosophical inquiries and experiments, he was no less attentive to the subject of religion; and with this view he applied to the study of the scriptures in their original languages. About the year 1652 he began his "Essay on Scripture;" and he continued it during frequent interruptions, occasioned by his journeys to Ireland at this period. Ireland, however, where he spent a great part of
two years, from 1652 to 1654, did not afford favourable opportunity for prosecuting the researches to which he was devoted; and, therefore, he employed the time of his continuance there principally in anatomical dissections, with the assistance of his friend Doctor, (afterwards Sir William) Petty. Upon his return to England in 1654, he settled at Oxford, where he had the advantage of pursuing his experiments, and where he enjoyed the society of many learned friends, who occupied different situations in the university. It was during his residence at Oxford, that he invented, or rather improved, the construction of the air pump (See Air pump); an instrument, by the use of which he was enabled to perform a variety of experiments, relating to the gravity and elasticity, and other qualities of the air, which entitled him to rank amongst the first philosophers of any age. He had at this early period of his scientific career renounced the philosophy of Aristotle, as a fyllem of words instead of things; and attached to the only just and effectual mode of pursuing philosophical researches by experiment, and fearing lest his mind should acquire any improper bias from the ingenuity of the author, he declined the perusal of the works of Des Cartes, whose philosophy was held by many in high estimation. Mr. Boyle did not restrict himself, whilst he continued at Oxford, to the study of philosophy; but he availed himself, in the prosecution of sacred criticism, of the assistance of those great orientalists, Dr. Edward Pococke, Mr. Thomas Hyde, Mr. Samuel Clarke, and Dr. Thomas Barlow, afterwards bishop of Lincoln. His correspondence was also at that time very extensive; and was carried on for the purpose of the promotion of science with Mr. Henry Oldenburgh, afterwards secretary to the Royal Society, Dr. John Beale, John Evelyn esq., Dr. John Pett, and Dr. John Wallis, who honoured him with the dedication of his excellent treatise "De Cycloides et corporibus inde genitis."

In 1659, as soon as he was made acquainted with the distressed circumstances of Dr. Robert Sanderson, afterwards bishop of Lincoln, who had been deprived of his preferments on account of his attachment to the royal cause, he settled upon him an annuity of fifty pounds a year; a favour which was respectfully acknowledged by the doctor in his dedication of "Ten lectures on cafes of conscience," delivered in Latin in 1657, and printed at Oxford in 1659.

After the restoration in 1660, Mr. Boyle was treated with great respect by the king, and also by the lord-treasurer, lord Southampton, and lord-chancellor Clarendon; and by the latter he was urged to enter into holy orders. Having considered the proposal with due attention, his pious scruples determined him to decline the clerical office. In this year he published his "New experiments touching the spring of the air;" which involved him in a controversy with Franciscus Linus and Mr. Thomas Hobbes, and to which he annexed a defence in the edition of 1662; and also his discourse "On saprophile love." Mr. Boyle's reputation had at this time extended itself to foreign countries; so that the grand duke of Tuscany communicated to him by Mr. Southwell, then resident at Florence, his wish to correspond with him on philosophical subjects. In 1661 he published his "Physiological essays, and other tracts;" and soon afterwards his "Sceptical chymist." Other treatises, to which he refers in this publication, and which were in great forwards, were unfortunately lost at the time of the great fire of London. In 1662, a grant of the forfeited appropriations in Ireland was obtained from the king in his name, but without his knowledge; and they were applied by him to the promotion of religion and learning. He was also appointed governor of the corporation for propagating the gospel in New England; and in this office he was active and successful in refounding the state, of which they had been deprived by Col. Bedingfield, a papist, although they had given him for it a valuable consideration. In the conduct of the concerns of this institution he was, in other respects, eminently useful. When the royal society was incorporated in 1662, Mr. Boyle was appointed one of the council; and as he may justly be regarded as one of the founders of this society, he continued through life one of its most useful and industrious members. In the following year he published his "Considerations on the usefulness of experimental philosophy;" his "Experiments and considerations upon colours," with "Observations on a diamond that shines in the dark;" and "Considerations on the style of the holy scripture," extracted from a larger work, entitled "An essay on scripture," published after his death by Mr. Peter Pett, attorney-general for Ireland. In 1664, Mr. Boyle was elected into the company of royal miners; this new connection, and other engagements of a benevolent and public nature, prevented his publishing any treatises, either on religion or philosophy, in this year. But the year 1665 produced his "Occasional reflections on several subjects," to which is prefixed, "A discourse concerning the nature and use of such kind of writings." This piece, which had been written by Mr. Boyle in his youth, and at various intervals, was rudely attacked by Dr. Swift in his "Pious meditations upon a broomstick, in the style of the honourable Robert Boyle." How far Mr. Boyle professed in his youth, or acquired in his mature years, a correct taste and style of writing, particularly in works of imagination, it is now needless to inquire; it is sufficient to observe, that no attack on the part of Dr. Swift can affect the fame of this distinguished person, either as a man or a philosopher. In this year Mr. Boyle, besides some communications to the Royal Society, printed in the Philosophical Transactions, published "Experiments and observations relative to an experimental history of cold, with several pieces thereunto annexed;" a work well received at the time, and containing a variety of observations and facts that have been useful to those who, in more modern times, have directed their attention to this interesting subject. Towards the close of this year, his majesty appointed Mr. Boyle provost of Eton college; but he declined accepting this honourable and lucrative office, because he did not with his studies be interrupted, and because he thought it more suitable to a person in holy orders.

About this time Mr. Valentine Greatrakes, an Irish gentleman of good family and competent fortune, and of a ferious disposition inclining to melancholy, perfuaded himself that he possess'd the power of curing diseases by brooking. In some cases he succeeded, but in others he failed. His performances, however, were so extraordinary, that they excited very general attention; and an account of them was published, by Mr. Henry Stubbs, in a letter entitled "The miraculous conf found of St. Joseph, &c." and addressed to Mr. Boyle. To this letter Mr. Boyle replied; but his answer was not published till eighty years afterwards, in Dr. Birch's account of his life. Nevertheless, the sentiments and reflections contained in it were probably communicated to his friends; and though they were expressed with a caution, candour, and judgment, that did him great honour, they were thought to contain some what pernicious, or the mere effects of enthusiasm, and they produced a controversy of some continuance. As far as Mr. Boyle was concerned in this busines, it will be sufficient to observe, that, firmly believing the actual exercice of those miraculous powers which attested the truth and divine origin of christianity, and admiring, in consequence of the extent and variety of his rearches, VOL. V.
researches into the operations of nature, the reality of facts, which he could not immediately reconcile by analogy to the small aggregate of human acquisition, the letter, hastily written by him in reply to Mr. Stubb, did not at all derogate from his character as a philosoper, or as a man of rational piety. He neither denied nor admitted the existence of the miraculous power ascribed to Mr. Greatrakes; but allowing the facts, he proposed a variety of inferences and queries, which demanded discussion; and in the whole of this controversy he conducted himself in such a manner as to avoid personal confiture from any of the disputants. See

Screaming.

In 1690 Dr. Wallis addressed to Mr. Boyle, "An hypothesis about the flux and reflux of the seas," printed in N. xvii. of the Philosophical Transactions; and Dr. Sydenham dedicated to him his "Mathematici curandi fines, praecipua observationum super intellectus."

His own publications in this year were "Hydrostatic paradoxes."

"Of the origin of forms and qualities, according to the corpuscular philosophy, illustrated by experiments;" and several papers communicated to the Royal Society, and printed in the Philosophical Transactions of that period. In the disputes that occurred in the establishment of the Royal Society between the adherents to the Aristotelian or old philosophy, and the advocates for the new method of philosophizing by experiments, Mr. Boyle took a decided part with the latter; but without incurring cenfore or reproach from the most violent of the opposite party. About this time Mr. Boyle removed to London, where he afterwards resided, very much to the advantage of the Royal Society, which he condescended by his personal presence and philosophical communications; as well as of the cause of science in general.

In 1669, he published his "Continuation of new experiments touching the weight and spring of the air," to which he annexed "A discourse of the atmospheres of confident bodies;" and also "A discourse of absolute root in bodies;" together with other hydrostatical pieces subjoined to his larger works: and in the same year he revised several of his former tracts, which had been translated into Latin for the benefit of foreigners. In the following year appeared his tracts "Of the cestinal qualities of things," containing a variety of interesting facts and observations; and several papers, communicated to the Royal Society. At this time his studies were interrupted by a stroke of the palsy, the effects of which were removed by a strict attention to a proper regimen; so that he soon returned to his labours. In 1671, he published a second volume of "Considerations touching the usefulness of experimental philosophy," and "Tracts of a discovery of the admirable rarefaction of the air, &c.;" and in 1672 appeared his "Essay concerning the origin and virtue of gems," 8vo.; his "Tracts, containing new experiments touching the relation between flame and air, and various other intersting subjects chiefly relating to the flatical action of fluids;" and, in the Philosophical Transactions, "Observations on shining fish," and a paper on the effects of the varying pressure of air. In 1673 he published "Essays on the strange subtlety, great efficacy, and determinate nature of effluviums;" "Experiments on the weighing and coercion of fire and flame," 8vo.; and "A letter concerning ambergris," communicated to the Royal Society. In 1674 appeared a collection of "Tracts on the flatness of the sea; on a flatygeoscopic; on the natural and preternatural state of bodies, and on the positive or private nature of cold," 8vo.; "The excellency of theology compared with natural philosophy," 8vo.; "Tracts, containing sulphuricous about the hidden qualities of the air: animadversions upon Hobbes's problem concerning a va-

cium; and a discourse of the cause of attraction by suction," 8vo.; and in this year he communicated to the editor of the Philosophical Transactions, "An account of the two sorts of hydrostatical lawns." In 1675 he published "Some considerations about the reconcileableness of reason and religion," by T. E. a layman; to which is annexed, by the publisher, "A discourse of Mr. Boyle about the possibility of the resurrection," 8vo. T. E. are supposed to be the final letters of his own name, as both these tracts are ascribed to him. In this year he communicated to the Royal Society four papers, which appear in the Transactions: "On the air-blisters of fishes;" "A new elysian instrument;" "New experiments touching the flashing of the air, &c.," and "An experimental discourse of quicksilver growing hot with gold." In 1676 he published "Experiments and notes about the mechanical origin of particular qualities," in which he treats of alkalis and acids, heat and cold, tables, colours, volatility, fixity, correlative action, precipitation, magnetism, and electricity; and he also communicated to the Royal Society two papers on the configuration of the surfaces of fluids in contact with each other.

Mr. Boyle, having been for several years an active and useful director of the East-India company, wishing to avail himself of his office for propagating the gospel in those remote parts to which their commerce extended; and with this view he caused 500 copies of the four gospels and acts of the apostles to be printed at Oxford, in the Malay tongue, under the direction of Dr. Thomas Hyde, and to be lent abroad at his own expense. For similar purposes of piety and benevolence, he had transmitted, about three years before, several copies of Grotius's "De veritate Christiana religionis," translated into Arabic by Dr. Edward Pococke, into the Levant.

In 1677 a miscellaneous collection of his works, defective, and badly arranged, was printed in Latin at Geneva. In the following year he communicated to Mr. Hook a "Short memoir of some observations made upon an artificial substance that shines without any preceding illustration," which was published in that philosopher's "Cutle-

rian lectures:" this substance was the phosphenus of urine. In this year he also published his "Historical narrative of a degradation of gold made by an anti-elixir," 4to.; and he received a tribute of singular respect, in a letter from the great Newton, laying before him his sentiments concerning an ethereal medium, which he afterwards proposed, in his Optics, as the mechanical cause of gravitation. In the year 1685, he published "The aerial noetics," 8vo.; and "An account of a new lamp," in Hook's Philosophical Collection; and he improved the second edition of his "Scepti-

cal Cynismi." Some persons have very unwarrantably as-

toed, that Mr. Boyle affirmed to himself the invention of phosphenus, after having purchased the secret of Kraft. This calamity is refuted by his own narrative, in which he dissects the claims of Brand, Kuncell, and Kraft, and acknowledges the advantage which he derived, in the prosecution of his inquiries, from the information communicated to him by the latter, that the shining substance was obtained from a matter belonging to the human body. From the narrative it appears, that the aerial noetics was an aqueous solution, or diffusion of phosphenus, obtained by distillation from putrid urine in an experiment where his retort failed; and which did not prove altogether successful. At the annual elec-

tion of officers for this year, Mr. Boyle was elected president of the Royal Society; but having objections of delicacy with regard to the official oaths that are required, and for some other reasons, he declined accepting the honour. At this time
time he contributed very liberally to the publication of Burnet's History of the Reformation, as the author acknowledges in his preface to the second volume. It was probably about the beginning of the year 1681, that he exerted himself for promoting the propagation of the gospel among the Indians; as his letter on this subject was a reply to one from Mr. John Elliot, of New England, dated Nov. 4, 1680. From this letter, which is preferved by Dr. Birch, it appears that he was a declared enemy to perfection on account of religious opinions. In this year (1681) he published his "Discourses of things above reason," and in the following year, "New experiments and observations made upon the icy nocticula," 8vo.; and also a "Continuation of new experiments physico-mechanical, touching the spring and weight of the air, with a large appendix." It appears that this icy nocticula was the solid phosphorus, which at first he found some difficulty in making; but from a paper left with the secretary of the Royal Society, to be opened after his death, which was nevertheless communicated to his friend Dr. Bell, during his life, we find that he evaporated urine by distillation till it acquired the confiuence of syrup, then mixed it with silicious land, and distilled by a strong heat into a reftor with containing water. See PHASOPHUS. In 1685 he wrote a letter, relating and encouraging an undertaking of Mr. Fitzgerald for rendering sea-water fresh; and in the following year, he published his "Natural history of human blood," and his "Experiments and considerations about the porosity of bodies," both in 8vo. From a letter addressed to Mr. Boyle in 1684 by the learned Dr. Cudworth, it appears how highly he appreciated his talents and labours. After recommending a collection of his several tracts, he concludes in these terms: "You have much outdone Sir Francis Bacon in your natural experiments; and you have not infalted any thing, as he is thought to have done, tending to irreligion, but the contrary." The year 1685 produced his "Short memoirs for the natural experimental history of mineral waters," and an "Essay on the great effects of even languid and unexcited motion," to which is annexed an "Experimental discourse of some hitherto little regarded causes of the faufrity and insalubrity of the air," 8vo. In the course of that year appeared in the Philosophical Transactions, "An account of a strangely self-moving liquor," which was a compound of oils and bitumens, the ingredients of which, though known to himself, he has not specified: and also a distinct tracts: "On the recommendableness of specific medicines to the corporcular; philosophy, to which is annexed, a discourse about the advantages of simple medicines," 8vo. Besides these philosophical tractes, he presented the world in this year with a theological tract, entitled, "Of the high veneration man's intellect owes to God, particularly for his wisdom and power," 8vo. The only work that appeared in 1686, was his "Free inquiry into the vulgar and received notion of nature." This tractate was much admired by the advocates for pure religion and found philosophy; it was translated into Latin, and repinted in the following year in 12mo. In this year, 1687, he published a work, written in his youth, entitled "The martyrdom of Theodore and Dydymus," and five decades of "Choice remedies," to which when the work was repinted in 1692, five more were added. In 1688 appeared "A disquisition about the final causes of natural things; wherein it is inquired whether, and if at all, with what caution, a naturalist should admit them; to which was subjoined, by way of appendix, "Some uncommon observations about vitiated sight." About the beginning of this year our author found it expedient to apprize the public, by way of preface to his mutilated and unfinished writings, and as a general apology for the state in which they appeared, that some of his papers had been stolen from him, and that others had been destroyed by corrosive liquors. The decay of his health, and the arrange- ment of his affairs in Ireland, obliged him to diminish the number of his communications to the Royal Society, and induced him to resign the office of governor of the corporation for propagating the gospel in New England. From other arrangements with regard to his private affairs, his papers, and the number of visits which he received, it appeared that he was not without apprehensions of an approaching change. The time, however, which he thus referred to himself, he indistinctly improved; as he avoided himself of it for collecting various elaborate processses in chemistry; which, as we are informed in a letter preferved by Dr. Birch, "he left as a kind of hermetic legacy to the studious disciples of that art." This collection he committed to the care of a friend, enjoining him to impart it to the public faithfully, and without envy, verbatim in his own expressions. This friend is unknown, and the work was never published. From many circumstances, however, we are led to conclude, that Mr. Boyle concurred, with many other ingenious alchemists of the age in which he lived, in believing, what is now rejected as a groundless opinion, the possibility of transmuting the baftr metals into gold; and hence, probably, he was led to take pains in procuring, in 1689, the repeal of the statute of the 5th of Henry IV. against the multiplying of gold and silver.

In 1690, he published his "Medicina hydrostatica, or hydromatics applied to the materia medica," 8vo. with the promise of a second volume, which never appeared; and "The Christian virtuoso, flowing, that by being addicted to experimental philosophy, a man is rather afflicted, than indispensed to be a good christian," a second part of which was published in an imperfect state, after his death. In 1691, he communicated to M. de la Croze, "An account of some observations made in the great congregation of waters, by lowering down bottles into the sea 600 feet from the surface," which was printed by that author in the "History of learning." Mr. Boyle's last work, published by himself, was his "Experiments et observationes physicae," to which is added "A small collection of strange reports," 8vo.

In July of this year, Mr. Boyle executed his last will, and in the succeeding months his health rapidly declined. On the 23d of December, he left his wife, lady Ranulph, to whom he was affectionately attached, and within a week afterwards, viz. on the 30th of December, 1691, he departed this life, in the 65th year of his age, and was interred at the upper end of the south side of the chancel of St. Martin's in the fields, near the remains of his father, with whom he had lived for the greatest part of 47 years. His funeral sermon was preached by Dr. Burnet, bishop of Salisbury.

Mr. Boyle's posthumous works are as follow: 1. "The general history of the air, designed and begun," 1692, 4to.; 2. "Medical experiments, or a collection of choice remedies, for the most part simple, and easily prepared," 1693, 12mo.; 3. "General heads for the natural history of a country, great or small, drawn out for the use of travellers and navigators," 1692, 12mo.; 4. "A paper of the honourable Robert Boyle's, deposited with the secretaries of the Royal Society, Oct. 14, 1680, and opened since his death; being an account of his making the phosphorus, &c. Sept. 50, 1683," 5. "An account of a way of examining waters, as to acidines or alkalines;" 6. "A free discourse against cultery glasses, and a diffusion from curdling," 1695, 8vo. 7. "Medical experiments, or a cole-..."
collection of choice remedies, chiefly simple and easily prepared, used in families, and fit for the service of the country people;" the 3d and last volume published from the author's original MSS. A collection of all Mr. Boyle's works was published in 1744, in 6 volumes folio, with a life prefixed, by Dr. Birch; and in 6 vols. 4to, in 1772.

Mr. Boyle, as to his person, was tall and slender, and of a pale and emaciated countenance. His constitution was so delicate, that he regulated his clothing by a thermometer; and he was occasionally subject to such dizziness of body, such painful paroxysms of the face, and such depression of spirits, that we may be well astonished at the number and variety of his scientific and literary performances. However, to the impiety of his diet, and the strict temperance which he observed, we may reasonably ascribe the degree of health which he enjoyed, and the length to which his life was protracted. His speech was slow and deliberate, and subject to hesitation; in his conversation he was unflattering, never dictating his own opinions, or urging his objections to those of others with confidence, but rather proposing them as topics of inquiry and discussion; and in his manners he was singularly mild and courteous. Although he was a favorite at court, and indulged in free intercourse with three successive sovereigns, viz. Charles II. James II. and William III., he never disguised his sentiments with regard to public men and measures; but he took no active part in the politics of the eventful times in which he lived, preferring the pursuits of philosophy, and the retirement which well suited his infirm frame and religious temper. To the rank of a peerage he never aspired, but refused it whenever it was offered to him. One of the most prominent features of his character, was his sincere and unaffected piety. This was exemplified in all his writings, and in the whole course of his life. Of his firm attachment to Christianity, and of his solicitude for vindicating its truth, and extending the knowledge and influence of it, he exhibited many substantial proofs, both whilst he lived, and at his death. Besides the translation of the gospels and books of acts into the Malay language, and of Grotius's treatise concerning the truth of the Christian religion into Arabic, which we have already mentioned, and which was conducted at his own expense, he proposed an impression of the New Testament in the Turkish language; and when the Turkey company undertook it, he liberally contributed towards accomplishing it. A translation and edition of the Bible in the Irish language colli him 700l.; and he defrayed a considerable part of the charge attending an impression of the Welsh Bible, and of the Irish Bible for Scotland. He gave, during his life, 300l. towards propagating the Christian religion in America; and as soon as he heard that the East India company were projecting a similar design in the East, he sent a donation of 100l. by way of example and encouragement in the prosecution of the scheme. Of the improprations belonging to his estates he ordered considerable sums to be given to the incumbents in these parishes, and even to the widows of those who had died before this distribution of his bounty. This he did twice during his life to the amount of 100l, and he ordered another distribution as far as his estate would bear, by his will. In other respects, his charities were so numerous and extensive, that they amounted, as bishop Burnet informs us, from his own knowledge, to upwards of 1000l. per annum. The annuity established by his will for providing a series of lectures in defence of Christianity, affords further evidence of the benevolence of his temper, and of his concern for promoting the interests of religion. See Boyle's Lectures. His zeal in the cause of religion, though it was ardent and active, was free from the least tincture of bigotry and intolerance. Whilst he adhered to the established church, he entertained the most undiffused charity towards all who differed from him in opinion: nor did he ever express himself in stronger terms, and with a greater degree of indignation, than when he condemned every kind of severity and persecution in the province of religion. Burnet in his funeral oration informs us, that his knowledge comprehended Hebrew and the other Oriental languages, the writings of the most eminent fathers, commentaries on the scriptures, religious controversies, and the whole body of divinity. He represents him as having acquainted with the whole compass of the mathematical sciences, and as well versed even in the most abstruse parts of geometry. Geography, navigation, and books of travel he had recourse to for the relaxation of his mind, and the amusement of his intervals of leisure. Of his knowledge with regard to subjects of natural history, chemistry, and experimental philosophy, his various researches and discoveries, recorded in his numerous publications already referred, afford ample evidence. Mr. Boyle, indeed, polished in an eminent degree those qualities, which justify his being ranked among the first philosophers of any age or country. He was distinguished by the comprehension of his views, and the extent and variety of his researches, by indefatigable diligence and invincible perseverance in his collection of facts and investigation of their causes, by a total freedom from any preconceived attachment to theories and systems, by candour in discrediting the opinions of others, and by fidelity, modesty and perfunctious in the narration of his own performances. Mr. John Hughes might well say of him (Spectator No. 554), after observing that he was born the same year in which lord Bacon died, that he was the person designed by nature to succeed to the labours and inquiries of that extraordinary genius. It would be endless to recount the testimonies in commendation of him, that might be collected from the writings of the most illustrious foreigners, and of the best judges of his merit in our own country. It will be sufficient to say, that he is uniformly ranked with Bacon and Newton; that his researches and experiments have led the way to many modern discoveries, both in philosophy and chemistry; and that his writings will ever be held in high estimation by every friend of science. "They cannot be read," says one of his biographers, "without improvement; and in these alone, if no life of Boyle had ever been written, the reader would behold a man truly deserving of the affliction, the estate, and the admiration of succeeding ages." Boyle's account of himself, under the name of Philocetes. Birch's life of Boyle, prefixed to his works. Burnet's funeral sermon. Biog. Brit. Birch's Hist. of the Royal Society. Phil. Trans. Boyle, Charles, fourth earl of Orrery, and baron Marli ton in England, was the second son of Roger, second earl of Orrery, and was born at Chelsea in 1676. At the age of 15 he was entered at Christ Church college in the university of Oxford, where his tutors were Dr. Atterbury, afterwards bishop of Rochester, and Dr. Freind. His application and proficiency were so distinguished, that he was elected by Dr. Aldrich, the dean, "the great ornament of our college," and deputed to prepare an edition of some classic author, for his annual publication. The book recommended by the dean was the "Epistles of Phalaris," of which a splendid edition appeared in 1695. This publication gave rise to a controversy, the particulars of which have been already detailed under the article Bentley. We shall here add, that from a letter of bishop Atterbury to Mr. Boyle, written in 1698, (see Epistolary Correspondence)
ence, &c. published by Mr. Nichols, vol. ii.) it appears, that the former laid the design of the celebrated book, in answer to Bentley's dissertations, wrote above half of it, revised a good part of the rest, and transcribed the whole. Upon the death of his father, Mr. Boyle quitted the university and entered into public life. He was chosen as a member of the house of commons in 1700; and when his brother Lionel died in 1702, he succeeded to the title of the earl of Orrery. For his services in the army, he was elected, in 1705, one of the kings' companions of the most ancient order of the thistle; and as a major-general, to which rank he was advanced in 1709, he distinguished himself at the battle of the Wood in Flanders. He afterwards retired for some time at Brusells, as the queen's envoy to the states of Brabant and Flanders; and for his faithful discharge of this trust, he was raised to the dignity of a British peer. On the accession of George I. he received additional honours; but during the absence of the king at Hanover in 1716, his regiment was taken from him: upon which he resigned his post of lord of the bed-chamber, and withdrew from public affairs. When Layer's plot broke out, he was suspected by the government, and committed to the tower: however, after being confined 6 months, he was first liberated by bail, and at length discharged. From this time he amused himself with his library and philosophical apparatus, till his death, which happened in August 1731. He was much esteemed for his domestic and social qualities; and respected for his talents and literary attainments. He was the author of a comedy, entitled "As you find it," and also of some longs and occasional poems; but his favourite studies were of a different kind. The astronomical instrument called an "orrery," and first invented by Rowley, whom he patronized, derived its name from his title. See Orrery. Biog. Brit.

Boyle, John, earl of Cork and Orrery, only son of Charles, fourth earl of Orrery, by lady Cecil, daughter of the earl of Exeter, was born in 1707, and for his early education entrusted to the care of Mr. Fenton, the poet. From Westminster school, whither he had been sent at a proper age, he removed to Christ-church college, Oxford. As an instance of his filial piety, which does him honour, it is related, that when his father was committed to the Tower, he earnestly intreated to be confined with him; but this indulgence was refused. Soon after the completion of his fifth year, in 1728, he married lady Harriet Hamilton, the young eldest daughter of George, earl of Orkney. A difference which occurred between the two, ears produced a temporary misunderstanding between the earl of Orrery and his son. This misunderstanding is said to have originated in lord Boyle's refusal to suffer his wife to sit at table with his father's mistresses. However this be, the son's conduct on the occasion, and in a situation peculiarly delicate and trying, reflected great honour on his judgment and temper. Although a reconciliation had been effected between the father and son, yet the latter found reason to regret their separation: for under the influence of a prejudice hastily conceived, the earl had made his will, and bequeathed his valuable library, consisting of above 10,000 volumes, with the exception of the journals of the house of peers, and books relating to the English history and constitution, bequeathed to his son, and a fine collection of philosophical instruments, to the college of Christ-church. After their reconciliation, he determined to alter his will, and had lent for his attorney with this view; but the suddenness of his decease prevented the execution of his just design. The young lord, however, beheld on the occasion with a filial pity and generosity, which entail singular honour on his memory. For though his father had died considerably in debt, and had left legacies to a large amount to persons who were no relations, he took his debts upon himself, paid the legacies, and sold the books and mathematical instruments, within the limited time, to Christ-church. The loss of his father, aggravated by the circumstances now recited, made a deep impression upon his mind, and he was succeeded by a fit of illness, which endangered his life. Of the sentiments of his feelings we may form some judgment by the following lines addressed to a friend, in return for a consolatory letter received by him at Bath, and enclosing a copy of verses, which exhort him to dispel his grief by poetry, and to shew that Bath could inspire as well as Temple dignitaries, where, in the preceding year, he had written some humorous verses."

"Nor Bath, nor Tunbridge, can my lays inspire, Nor radiant beauty make me thrice the lyre; Far from the busy crowd I sit forlorn, And sigh in secret, and in silence mourn: Nor of my anguish ever find an end; I weep a father, but I've lost a friend."

Upon the recovery of his health and spirits, he took his seat in the house of peers in January 1732, and distinguished himself by his opposition to sir Robert Walpole's administration, and particularly by his speech against the mutiny bill, and a standing army, which was much applauded. However, the delicacy of his health, his love of retirement, and the necessity of occasional residence in Ireland, precluded him from a regular attendance on his parliamentary duties. During his residence in Ireland, he became acquainted with dean Swift, who professed a high regard for him, and introduced him to the friendship of Mr. Pope. Upon his return to England, in 1733, he retired to his seat at Marlton in Somerfetshire, and amplyd himself in buildings, planting, and improving both his estate and his library. In 1737 he took a house in town, for the convenience of superintending the education of his sons at Westminster school. Having lost his first lady in 1737, he married a second wife in 1758; and with both he enjoyed the most uninterrupted state of domestic felicity. In 1739 he published a new edition, in 2 volumes 8vo. of the dramatic works of his great grandfather, Roger, earl of Orrery, and, in 1743, his letter to a woman in one volume. The full of his own performances, which was imitations of the first and fifth odes of the first book of Horace, with remarks on the peculiar excellencies of this poet, and on the translations of Duke and Sanderson, appeared in 1741, fol. In 1743 his lordship was pronounced, by the university of Oxford, with the honorary degree of doctor of civil law, and he was likewise elected a fellow of the Royal Society. In 1746 he removed to Caledon in Ireland, where he resided, with little interruption, till the year 1756; employing his intervals of leisure in laying out gardens and plantations, and in various substantial and ornamental improvements. On his return to Marlton he pursued these alterations and improvements which he had begun at a former period. In the mean while, the employment of his winter evenings was his "Translation of the Letters of Pliny the Younger, with observations on each letter, and an essay on Pliny's life," which was published at London in 1751, in 2 volumes 4to. and since reprinted in 8vo. This work was well received, and established the reputation of the author as a polite scholar; and it would have still retained its character as a standard work of the kind, if it had not suffered by the inferior elegance of Mr. Mcintosh's translation. In the same year appeared his "Remarks on the Life and Writings of Dr. Swift," in a series of Letters addressed to his second son; which, abound with popular anecdotes, met with a very rapid sale, though it gave occasion to many criticisms and attacks, or account
account of the freedom with which it represented the def-

found as well as the excellences of the character of his old

friend. The portrait it exhibits is, however, deemed more

suitable than several others of a more flattering kind.

In 1743 Lord Orrery succeeded to the Irish titles of Richard the

court and of Burlington and fourth earl of Cork, who died

without male issue. His lordship continued to amuse himself

and the world by occasional writings; and communicated

several papers, chiefly of the humourous kind, to the peri-

dodical publications entitled, The World," and "The Con-

siderator," the former conducted by Mr. Moore, and the

latter by Mr. Thronton and Mr. Colman. In 1744, he

set out on a tour to Italy, and resided nearly a year at Florence,

where he acquired much elegance, and where he collected

materials for his history of Tuscany, which he proposed to

publish in a series of letters; but of these he only finished

two, which were published after his death in 1774. From

1762 he returned to Marden in 1755; but the last

years of his life were rendered peculiarly distressing to him by

the loss of his wife and his eldest son, and by frequent and

frightful paroxysms of the gout. These trials, however,

he bore with a fortitude and resignation which did honour to his

principles and his character, both as a philosopher and a Christian.

In his distress he sought refuge, like Thiny, in his studies,

and amised himself by publishing, in 1759, from an original MS.

"Memoirs of the Life of Robert Cary, earl of Monmouth," with

a preface, explanatory notes, and a tender-dedication to his

youngest son. He also, in the same year, wrote a preface to

Mrs. Lenox's translation of Brumoy's Greek theatre; and

he transcribed "The Dido and Aeneas," the original of the

Greek," "The original of tragedy," and "The parallel

of the theatres." Some smaller pieces, written by his lord-

ship, are interspersed in the periodical publications of his life.

His last work, which was posthumous, is his "Letters from

Italy," written in the years 1754 and 1755, and published

in 1774, by the Rev. John Duncombe, who hath prefixed a

life of his lordship. In his last illness he is said to have burnt

many MSS. and, among them, the continuation of his letters

from Italy, on account of their not being corrected and fairly

transferred. It is also apprehended, that his Florentine

history underwent the same fate. At length this truly ac-

complished and amiable nobleman fell a sacrifice to an

dehydraulic gout, at a comparatively early period, in November

1762, in the 56th year of his age; and his remains were

interred near to those of his second lady, in the burial-place of

his family in Frome church. He was succeeded as earl of

Cork and Orrery by Hamilton, his second son by his first

cousins; and on his death the titles and estate of the family

devolved on Edmund, his son by his second lady, who became

the seventh earl of Cork and Orrery.

From the tribute of just respect paid to his memory by the

writer of his life, we learn, among other particulars, that "in

every domestic and social relation, in all the enduring con-

nections of life, as a husband, a father, a friend, a matter, he

had few equals. The humour which he received from rank and

title, and from the personal merit of his family, he reflected

back, unimpaired and undiminished; and though the poet of

the world, which he chose and preferred, was a "private

station;" though he was neither a flatterer nor a fiddler, like

the first lord Cork, the first lord Orrery, and his own father;

the rival of Paladio, like the late lord Burlington; or the

rival of Bacon, like Mr. Robert Boyle; yet, in a general

taste for literature, and, as they are commonly called, polite

studies, he was by no means inferior to his ancestors." He

loved truth even to a degree of adoration. He was a real

Christian; and, as such, constantly hoped for a better life;

there truly to know the real causes of those effects, which

here struck him with wonder, but not with doubt." Mr.

Duncombe proceeds to exhibit, in several instances, the

striking resemblance between the earl of Orrery and Pliny,

his favourite Roman. With regard to religion, his senti-

ments were rational, and his moral conduct as irreproachable

and exemplary, as his manners were elegant and accomplished.

His political principles were those of a disinterested patriot,

and an ardent lover of liberty. His sentiments and feelings

on this last subject are admirably displayed in the following

lines, extracted from one of his pieces prefixed to his

"Translation of Pliny," and expressing the love of Britons

for liberty:

"With native freedom, as with courage blent,

Chains, and each mark of thraldom we detest.

'Tis heaven's high gift, 'tis nature's great decree.

That none be slaves, whom God himself made free.

Revere we ought those powers which we enthrall,

But to ourselves be absolutely just:

Scorn base corruption, nor, like slaves, dishonour

The laws that fix'd our monarch in his throne:

For well we know, by Truth's eternal rules,

Whence slaves are free, sing, subjects must be fools.

Exert but reason, liberty will reign,

And tyranny exalt her impious head in vain."

Biog. Brit.

Boyle, in Geography, a market and port town of the

county of Roscommon, and province of Connaught, Ire-

land, sometimes, but improperly, called Abbey-Boyle. It

is situated on the river Boyle over which it has two stone

bridges. In 1756, it contained about 260 families, and has

probably increased; its linen markets having of late become

considerable from the improved state of the yarn and linen

manufactures in its neighbourhood. This town had a castle,

which was of great strength, having held out during the

civil war of 1641. It was one of the new corporations in

the reign of James I. and continued to send two members to

parliament until the act of union deprived it of that privilege.

In the neighbourhood, and at present included within the

demise of lord Kinlton, is the ruin of the abbey of Boyle,

finely situated near Lough Key, from which the town

derived its name, and probably its existence. It belonged

to the Cisterian monks, and was founded in 1161, after

three or four other places had been tried, and not found

sufficiently agreeable. The monkish records mention several

noble converts who took the habit of the order, and probably

enriched it with considerable benefactions; and they also

mention some instances of sacrilegious plunder, in the

wars which for so long a time distracted Ireland. When the

dissolution took place, the property of the abbey was found

to be very considerable, and was granted to sir John Kin-

cestor of the earl of Kinlton, by James I. in 1623, in

reward of his services. The remains of this ancient erection

are sufficient to show its former magnificence, and defere

the attention of the antiquarian. The architecture is Gothic,

and the arches are enlivened for their noble elevation and

grandeur; and are of so firm a texture as to have with-

stood the severest shocks. Boyle is 8:4 miles N. W. of

Dublin. N. lat. 53° 58′. W. long. 8° 13′. Beaufort—

Moralitic Hibernicum.

Boyle, or Buell, the name of a river which, rising

in the county of Mayo, flows into a romantic sheet of water

called Lough Gaa; thence meandering through woods

and dales, it enters Lough Kee, or Kinglton lake, a beau-

tiful piece of water, interparagus with several islands, some

of which are adorned with old caddies and ruins; others in

the flat of nature, wooded with lofty timber trees; and

some highly improved without a tree to be seen, but the

more
more pleasing prospect of everlastling verdure. The river again emerges out of the cataract side of this lake, as it were by constraint, and then glides on to pay its tribute to the Shannon, which it joins a little above Carrick.

Boyle's Lectures, a course of eight sermons or lectures, preached annually, set foot by the honourable Robert Boyle, esq. by a codicil annexed to his will in 1691; the design of which, as expressed by the inliterator, is, to prove the truth of the Christian religion against infidels, without deceding to any controversies among Christians; and to answer new difficulties, perplexes, &c.

For the support of this lecture, he assigned the rent of his house in Crooked-lane to some learned divine within the bills of mortuary, to be elected for a term not exceeding three years, by the late archbishop Tenison, and others. But the fund proving precarious, the salary was ill paid; to remedy which inconvenience, the said archbishop procured a yearly stipend of 50 pounds, for ever, to be paid quarterly; charged on a farm in the parish of Brill, in the county of Bucks.

To this appointment we are indebted for many elaborate defences both of natural and revealed religion. A collection of these sermons from the year 1691, to 1732, was printed in 1739, under the title of "A defence of natural and revealed religion," in 3 vols. fol.; and those of several of the preachers have been printed and published in different volumes. An abridgment of these lectures in 4 vols. 8vo. was published by the Rev. Mr. Gilbert Burnet, vicar of Coggelhall, in Essex, who died in 1764. Boiler, See Boiling, and Ebulbition.

Boyston, in Geography, a township of Worcestcr county, in the state of Massachusetts, America, 10 miles N. E. of Worcester, and 45 N. W. of Bolton. It was incorporated in 1786, and contains by survey 14,336 acres of land, of rich soil and well watered, and 839 inhabitants.

Boyne, the name of a considerable river in Ireland, supposed to be the Babinda of Ptolemy. It takes its rise in the bog of Allen, in the county of Kildare, and having separated that country from the King's country, and the southern part of Meath for several miles, it enters the latter county at Clonard, and flowing N. W. divides it nearly into two equal parts, forming the general division of the county, and constituting a boundary to every barony touching its banks. The scenery of this river has been much celebrated, and there are few situations adapted to the purpose of mill machinery that are not occupied. In its course within the county of Meath alone, there are six extensive boulting mills, besides several grist and cloth mills; and one for the manufacture of cotton was erected in 1822. The Boyne navigation, between Drogheda and Navan, runs along the course of the river, and has considerably increased the trade of both those towns. At Navan, it receives the Blackwater, and having passed by Slane and Drogheda, it flows into the Irish sea, a few miles below the latter town, to which it is navigable. The fertility of this river is valuable, and the salmon in particular is highly esteemed. The Boyne, however, is not so noted for any circumstance as for the victory gained by William III. over that insatiable prince James II. on the 11th of July, 1690. The place where the battle was fought is between Drogheda and Slane, and is marked out by an obelisk, founded on a rock, which rises boldly from the river. The advantage of situation was in favour of James's army; and if he had not himself fled before the battle was decided, the event might have been very different. The brave duke Schomberg lost his life on this occasion, and William was often in great danger. It was long customary to celebrate the anniversary of the day on which this battle was gained; but as it served no purpose but that of perpetuating party animosity, the observance begins to be neglected; and it is to be hoped that the different acts will become so united in attachment to their common country, as to afford to forget that they were ever enemies. Thomson's Meet, &c.

Boyne, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Pithiviers; 2 leagues S. E. of Pithiviers, and 7 N. E. of Orleans.

Boyse, or Bois, John, in Biography. See Bos.

Boyse, Joseph, a protestant dissenting minister, was born at Leeds, in Yorkshire, in January, 1659-60. After early infiruation under the care of his parents, he received the first part of his education for the ministry at the private academy of the Rev. Mr. Frankland, near Kendal, in Westmorland, and completed it under the tuition of the Rev. Mr. Edward Veal, who kept a private academy at Stepney, near London. Having continued in these seminaries five years, he procured himself of the opportunities which he enjoyed in the latter situation of attending on the preaching of many able divines, both conformists and non-conformists, he entered on the exercise of his ministry about the year 1680. In 1683, finding that he could not discharge the duties of his function in England without molestation, he accepted an invitation to be joint-pastor with Mr. (afterwards Dr.) Daniel Williams, in Dublin; and had afterwards for his co-adjutor the Rev. Mr. Thomas Emlyn, so well known for his writings and his sufferings. This connection subsisted for more than ten years with mutual friendship and uninterrupted harmony; but it was at length dissolved in consequence of Mr. Emlyn's sentiments concerning the doctrine of the Trinity. On this occasion the zeal of Mr. Boyle for the orthodox led him to take some steps that were thought injurious to his former colleague, and inconsistent with the friendship that had subsisted between them; though he disapproved the prosecution which Mr. Emlyn suffered, and behaved towards him with a greater degree of kindness than any of the other dissenting ministers of Dublin. The latter years of Mr. Boyle's life were embittered by bodily disorders and estranged circumstances. His funeral sermon was preached in December, 1728; but the precise time of his death is not known. He was considered as a pious, learned, and useful divine; affable in the exercise of his ministry, and in his conduct generally esteemed. He had a principal concern in promoting the act of toleration in Ireland. His works were published in 1728, in 2 vols. fol. The first contains 71 sermons, 6 dissertations on the doctrine of justification, and a paraphrase on these passages of the N. T. which chiefly relate to that doctrine. The second volume contains several pieces, of which the principal is "A Vindication of the true deity of our blessed Saviour," in answer to Mr. Emlyn's "Humble inquiry into the Scripture account of Jesus Christ, &c." As Mr. Boyle's answer was published at the time when Mr. Emlyn was under prosecution for his sentiments, his conduct did not escape censure; and was thought not to be candid, liberal, and ingenuous. Biog. Brit.

Boyse, Samuel, the son of the former, was born in 1708, and having received the rudiments of his education in a private school at Dublin, was sent, at the age of 18 years, to the university of Glasgow, probably with a view to the office of a minister. Before he had attained his 20th year, he imprentunately married; and this connection, in addition to the natural extravagance of his temper, involved him in pecuniary difficulties, which obliged him to quit the university.
university before he had finished his studies, and to seek relief for himself, his wife, her sister, and family, from his father at Dublin. Notwithstanding the indulgence he received, very much to the injury of his father's circumstances, his own conduct, which was marked by indolence and dilipation, and that of his wife, who was dissolute and vicious, contributed to cause his distress, and to accelerate his ruin.

After the death of his father, all his resources failed, and he was under a necessity of repairing to Edinburgh, where his poetical talents procured him a considerable degree of patronage. In 1731, he published a volume of poems, to which were annexed a translation of "The tablature of Cebes," and "A letter upon liberty," which had been printed in the Dublin Journal, in 1726. This publication gained him reputation, and recommended him to the patronage of the countess of Eglington, to whom it was addressed.

Upon the death of the viscountess Stormont he wrote an elegy, entitled "The tears of the muses," for which he received a handsome present from her husband, lord Stormont. These tokens of favour, on the part of his lordship, and of the countess of Eglington, served to procure for him the patronage of the duchess of Gordon, who employed her interest in obtaining a place for him in the customs at Edinburgh, but he lost the intended benefit by his own negligence.

Having reduced himself by his own imprudence and indolence to extreme poverty and distress, he was under a necessity of leaving Edinburgh; and with recommendations to Mr. Pope and Sir Peter King, then lord chancellor of England, as well as to other persons of rank, fashion, and influence, obtained from the duchess of Gordon, and from lord Stormont, he removed to London.

But his own indigence defeated the kind design of these recommendations, and he again experienced the difficulties of indigence, without making any attempt to extricate himself, besides writing a variety of mendicant letters. These served to procure him a temporary supply, which he soon expended by the most unaccountable and inexcusable extravagance.

About the year 1740, his penury and wretchedness were so extreme, that he pawned his apparel, and even his bed-cloaths, and confined himself in his lodgings and his bed, with no other covering besides a blanket. Wrapped only with this covering, he sat up in bed, having cut a hole through it large enough to receive his arm; and placing the paper on his knees, he scribbled in the bell manner the verses he was obliged to make. When he was under a necessity of appearing abroad, he occasionally supplied the want of a shirt by slips of white paper round his wrists, and neck. In this state he remained for several weeks, without any other subsistence except what he could obtain by writing verses for the magazines, and from benefactions procured by the most abject supplications, and by the meanest arts of deceit.

When he was employed in translating from the French, it was his constant practice, after sending a sheet to the press, to pawn the original, and to repeat this as often as it was redeemed during the course of his work. After passing through various scenes of a wretchedness that is scarcely parallelled in the records of human misery, in the viscidflutes of spinning-houses, garrets, and ale-houses, he resided at Reading, in 1745, where, having lost his wife, he was employed in completing his historical work, entitled "An historical review of the transactions of Europe, from the commencement of the war with Spain in 1739, to the insurrection in Scotland in 1745, &c." and published in 1747 in 2 vols. 8vo.

This work, for which the author was paid at a very low rate, is not defiuite of merit, and contains much useful information respecting the history of that period. After his return from Reading, he married a second wife of low condition, but he assumed a more decent behaviour, and some hopes were entertained of his reformation. He was employed by a bookseller to translate Fenelon's "Demonstration of the being of a God." At this time his appearance was very different from that to which he had been accustomed, and he seemed to pay some regard to his character. Towards the close of his life, and during a lingering illness which preceded his dissolution, the principles which he had imbied, contrasted against the licentiousness and profligacy of his conduct, produced a degree of remorse and self-reproach, which he could not evade or suppress. So deep, indeed, and so permanent were the impressions of his good education, that his whole life was a kind of conflict between his vicious inclinations, and his sober reason. It was, as it is said, from the experience of this mental struggle, that he wrote his poem, entitled "The recantation." He died in indigence and obliqity in London, in the month of May 1744, and was buried at the expense of the parish. Few instances occur, in which distinguished talents have been so lamentably perverted, than in the case of Mr. Boyse. Besides his genius for poetry, he possessed a taste for painting, music, and heraldry; and if his powers had been diligently cultivated and exercised, he might have acquired a higher degree of excellence than he ever attained; and he would certainly have escaped the ignominy and wrath of his conduct, which were the consequences of his misconduct. His poetical effusions, if they were collected from the periodical works in which they were published, would make several volumes. Two volumes were published in London during his life. The most celebrated of his poetical productions was his religious poem, entitled "Deity," and published about the year 1741. This poem received the public commendation of two very different writers, viz. Hervey, in his "Meditations," and Fielding in his "Tom Jones," and it was so popular, as to have passed through three editions in 1752. Of this piece, Mr. Boyse said, that Mr. Pope, upon being asked if he was the author of it, disclaimed the work, but at the same time acknowledged, that there were many lines in it, of which he should not be ashamed. The best of Mr. Boyse's productions are admitted into Dr. Anderson's collection of the poets of Great Britain, printed at Edinburgh. In Ogle's Canterbury tales of Chaucer, modernized, several appear under Mr. Boyse's name, and are executed with spirit. His ode entitled "Alison's triumph," was written on occasion of the battle of Dettingen in 1743, and published without his name. Cibber's lives of the poets, vol. v. Biog. Brit.

BOYERSTEIG, in Geography, a calcareous mountain of Germany, near Stuttgard, the capital of the duchy of Wurttemberg.

BOYUANA, in Zoology, the name of an American kind of serpent, of a long and slender form, the colour entirely black. It is related of the boyuana, that it has exactly the semblance of a fox, but so strong, that no one can endure to be near it. The particular species, or even genus is uncertain. Several of the serpent races have an offensive scent; that of some of the boa tribe is known to be intolerable, when they have seized upon their prey, and begin to anoint it with their saliva, preparatory to swallowing it.

BOZE, Claude Gross, in Biography, an eminent antiquary, was born at Lyons, in 1680, and after first applying himself to jurisprudence, devoted his whole attention to antiquities and medals. In this study he was encouraged by the chancellor Pontchartrain, Bignon, Vai'llant, and Hardouin, who became attached to him on account of both his amiable character and extensive erudition. In
BOZ

1705, he was admitted into the academy of inscriptions and belles letters, and in the following year appointed perpetual secretary. He became a member of the French academy in 1715; and in 1719, he was appointed keeper of the royal cabinet of medals, the treasures of which he augmented by his journey to Holland in the ensuing year. Upon his return to Paris, he devoted himself wholly to his academical and official duties, except that he contributed also some occasional papers to the "Journal des Scavans." He died, much esteemed for the gentleness and politeness of his manners, in 1754.

His publications are, the 15 first volumes of the "Memoirs of the Academy of Inscriptions, &c." to which he added the historical catalogues of its members, published separately in 2 vols. 12mo., and much valued as elegant and judicious compositions, particularly the latter of them; the second edition of the "Medallie history of Lewis XIV." brought down to that king's death, 1727, fol.; "The history of the emperor Tetricus, illustrated by medals;" and several dissertations on medals and other subjects of antiquity, in the academical memoirs. A catalogue of his valuable library was published in 1745, and is highly prized by bibliophiles. Another was published after his death, 1753, 8vo. Moreiri. Nouv. Dicr. Hiflor.

Bozen, in Geography, an island and river in the island of Sardinia. The town is on the south side of the river, which falls into the ocean on the west; and the island of this name lies off the west to the south, between the mouth of that river and another situate to the south of it.

BOZEN, See BozanO.

BOZENTIN, a town of Poland, in the patinate of Cracow, seated at the foot of the Kalkberg mountain, and surrounded with a wall and rampart.

BOZIN, Bosin, Basimek, Basina, or Bazinium, a small, but handsome, free royal city of Lower Hungary, in the upper outward district, seated on a rising ground. The inhabitants are industriously employed in the cultivation of vineyards, trade, and handicrafts. In 1605, 1626, and 1655, this place was laid in ashes.

BOZICK, or Brzick, a small town of Hungary, with a castle, in a district of the same name.

BOZOLS, a town of France, in the department of the Acreydon, and chief place of a canton, in the district of Rodos, or Rhodes, and 10 miles N. E. of it. The town contains 2,360, and the canton 6,627 inhabitants; the territory comprehends 23½ kilometres, and 12 communes.

BOZRAH, in Ancient Geography. See Bostra.

Bozrah, in Geography, a town of America, in New-London county, and state of Connecticut; 36 miles E. from Norwich.

BOZASOTRA, Anthony, in Biography, a celebrated professor of medicine in the university of Naples, his native country, flourished the early part of the 16th century. His works are "Quintus de calido monto," Napoli, 1542, 4to. "De veneficiis in uterum gerenti, adverto negantes hujusmodi auxillium pro cautione abortus," Rome, 1545, 4to. The author thaws that the prohibition of Hippocrates, to the bleeding of pregnant women, arose from the rude custom of bleeding ad consummationem; but that blood might be drawn in small quantities from women in that state, not only safely, but with advantage. "Traütäs quattuordesim medendi methodi, ex Galeno," Napoli, 1549, 8vo. He died Jan. 15, 1557. Haller, Bib. Med. Eloy. Dict. Hist.

BOZZOLO, in Geography, a town and small principality of Italy, in the duchy of Guaitella, adjoining to the Cremona, formerly belonging to the duchy of Mantua, from which it was separated. The town was fortified in 1734. It is situate 15 miles W. of Mantua, and 20 E. of Cremona.

BRA, Henry de, in Biography, commonly called Henry de Bra, a physician of considerable eminence, born at Dunkin, in Wiltshire, on the 25th of September, 1555, was initiated into the study of medicine by his father, who was pensionary physician to the town. To improve his knowledge his father sent him to visit the different universities in France, Italy, and Germany. After spending eight years, he returned by Baden, where he took his degree of doctor in medicine, under John Babine, the elder. He now went to Kempen, where he practiced about eight years, but was at length invited to Zutphen, and made pensionary physician, and there continued to the end of his days. His works, which were in request in his time, are "Medicamentorum simplicium et facie parabolium ad icterum et hydropeum, catalogus, et quomodo iis utendum," Leid. 1590, 8vo. "De curandis venenis per medicamenta simplicia, et facie parabolica," Arnheim, 1612, 8vo. with others of a similar kind. "De novo quodam mortui generi, Filiis et Welfsbazat pecuniari," published in the works of Petrus Forelius. Haller, Bib. Med. Eloy. Dict. Hist.

Bra, in Geography, a town of Italy, in the principality of Piedmont, including 3 parish churches; 10 miles S. E. of Cargnolagni, and 2 N. W. of Cherasco.

BRAAN, a river of Scotland, which runs into the Tay, near Dunkeld, in the county of Perth.

BRAAWICKEN, or Bravicken, a gulf of East Gothland, on the west side of the Baltic sea, about 30 leagues S. W. from Stockholm, into which the river Motola discharges itself near the town of Nordkiopin.

BRABANCIONES, in Middle Age Writers, a kind of Netherland soldiers, infamous for rapine, being little better than commissioned banditti, who hired themselves to fight for any that could pay them belt.

The word is variously written by the historians of those days; all given them from the country of Brabant, which was the chief nursery of those troops. They are also frequently confounded with the Rotarii, Roturiers, Raptoria, Rotarini, Cetera, &c. Daniel. Hist. de la Mil. Fran. liv. iii. chap. 8.

Towards the close of the 12th century, when the government in all the states of Europe was relaxed, and it was almost impossible to enforce any general execution of the laws, troops of banditti under their denominations were emboldened to disturb the public peace, to infest the highways, to pillage the open country, and to brave all the efforts of the civil magistrates, and even the excommunications of the church, which were fulminated against them. Some of these troops were occasionally enlisted in the service of one prince or baron, and others in that of another; they often acted an independent manner, under leaders of their own; the peaceable and industrious inhabitants, reduced to poverty by their ravages, were frequently obliged to betake themselves to a like disorderly course of life; and a continual insidious war, pernicious to industry, as well as to the execution of justice, was thus carried on in the bowels of every kingdom. These mercenary ruffians formed a kind of society or government among themselves, which fet at defiance the reft of mankind. The greatest monarchs were not ashamed, on urgent occasions, to have recourse to their assistance; and as their habits of war and depredation had given them experience, hardihood, and courage, they generally composed the most formidable part of those armies, which decided the political quarrels of princes. Accordingly Henry II. enlisted numerous troops of them in his service; and the situation of
BRABANT, DUchy or, a province of the Netherlands, bounded on the north by Holland and Gelderland, on the east by Gelderland and the principality of Liege, on the south by Namur and Hainaut, and on the west by Flanders and Zealand. The circumference is estimated at about 50 leagues, and it contains twenty-six walked towns, besides several others of inferior importance; the principal cities are Louvain, Antwerp, and Bruxelles. It was first erected into a duchy in the 7th century, and formerly belonged to the Frankish monarchy; but it afterwards became a fief of the German empire. The last duke of Brabant, of the race of Charlemagne, was Otto, on whose death, in 1097, it came to Lambert I. count of Louvain, who married the sister and heirest of Otto. By his polity it descended to Philip II, duke of Burgundy; and from him in the line of his family to the emperor Charles V., and by him to Philip II. king of Spain. In the 17th century the republic of the United Netherlands took possession of the northern part of the duchy of Brabant, which it retained at the peace of Westphalia. This comprehended the quarter of Bois-le-Duc, (which fee,) and a part of the quarter of Antwerp. Charles III., afterwards known by the title of the emperor Charles VI., after the battle of Ramillies, in 1706, took possession of the Austrian part of this duchy, confining the town and quarter of Louvain, thesee of Bruxelles, and thesee of Antwerp. A small part towards the south was known by the name of Walloon Brabant. When the French passed the Rhine they established themselves in Brabant; and by the new partition of their territories and conquests, in consequence of the third article of the treaty of Campo Formio, in 1797, and the second of the treaty of Lunville, in 1801, which excised the Austrian Netherlands to the French, the eastern part of Brabant was formed into the department of Deux Nethers, and the southern part into that of Dyle. The air of Brabant is good, and its soil fertile. It produces a great quantity of flax, and is watered by several rivers, of which the chief are the Dommeil and the Dener, which, after receiving the smaller rivers of Ghute, Dyle, Seene, and Nethre, takes the name of Rupel, and discharges itself into the Scheld. The religion of this country is the Roman catholic. Mr. George Foster, who travelled through this country in 1799, gives a very unfavourable account of it. See his travels, vol. iii. In no place, he says, has ignorance ever established its dominion so firmly, nor diffused so palpably a darkness, as over the minds of the Brabanters; and nowhere has the iron yoke of implicit faith so deeply degraded the human understanding. Never, he adds, since they were deluged with blood by Philip and Alva, have these provinces attracted the notice of mankind, except when foreign armies made them the theatre of war, or when, like an absolute property they were transferred from one princely family to another. Nothing can be a greater proof of the stupidity and inoffensibility to which the people were sunk, than the indifference shown by the Brabanters, and the opposition made by the Flemings, to the design of the emperor Joseph II. to open the navigation of the Scheld. Indeed the picture which he gives of the decayed state of their manufactures, of the wealth and power of the church, of the insolent spirit of the nobles, and of the superstition which prevails among all ranks, is sufficient to convince us that the inhabitants of these countries were so exceedingly degraded by civil and religious tyranny, that they were become totally insensible to everything that can dignify human nature. Of the people, however, he observes, that their good qualities are their own, but that their faults are derived from their teachers. They are remarkably phlegmatic, but humane, good natured, and friendly; even amid the violence of passion, they are neither cruel nor implacable. The measures which Joseph II. concerted, however arbitrary in their first appearance, imprudent in their arrangement, and precipitate in their execution, were designed for restraining the power of the insolent priests, and for abolishing the greater absurdities of popery. But the insurrections occasioned by them, and the revolution in which they terminated, were attended with consequences which the people had reason to lament. By throwing off their allegiance to the emperor, they fell under a heavier yoke, and groaned under the most intolerable of all despotisms, that of an absolute arbitrariness. How far their condition has been improved since their country has been made a part of Belgium, by the extension of the French conquests, time must determine, and their own experience may clearly in some measure be able to testify. See Netherlands.

Species. B. Stellatifolium, (Syth. Nat.) Stellatifolium, (fp. plant.) Breyn. Cent. 1. pl. 1. Pluk. 457, pl. 265. La Mark, pl. 847. African almond. A native of the country about the Cape of Good Hope, where it grows to a tree of a moderate size, but in Europe it seldom grows above eight or nine feet high. Stem straight, short, full of pith, covered with a brown bark, throwing out horizontal branches at each joint, which gradually diminish from the bottom to the top so as to form a sort of pyramid. Leaves lanceolate, of a deep green on their upper, and a pale rufet colour on their under side, reticulated with a few blunt serratures at their edges, and growing in whorls on short peduncles, round the joints or knots of the branches, from five to seven in a whorl. Aments axillary, growing also in whorls, a little shorter than the leaves. The fruit is called, at the Cape of Good Hope, the wild chefnut, and is greedily eaten by the wild boars.

The foregoing generic character and description have been drawn up from a careful comparison of Linnaeus, Martyn, La Mark, and Boëc, who all agree in calling the brabeium
bein am amantaceous tree. But Linnaeus must have used the term in a lax and improper sense; he would otherwise have placed the genus in his natural order of amantaceae, and not among those whose natural character he deemed dubious. When La Mark wrote his description in the Encyclopaedia Methodica, he had in his possession only a dried specimen without flowers, brought to Europe by Sonnerat; he consequently described the fructification from preceding authors. Where he obtained the figure published afterwards, and how he would now describe the plant, is not known, the letter-per- to that part of the work not yet published; but certain it is that the fructification, as it is there delineated, has not the appearance of an ament. It corresponds much better with the following natural character by Jussieu. (The corolla of other authors.) Cal. small, four-cleft, at first constricted, afterwards rounded, the segments bearing the stamens at their base. Stamens, four, anthers oblong, attached to the inner part of the filaments. Style, one or two. Drupa, villose, one-seeded. Leaves (of the Theophrastus) nearly in whorls; flowers in axillary spikes, falcate, the falcace confiding of three or more flowers connected with a single bractea, (the scale of the ament, of other authors.) The calyx sometimes five-cleft, with five lalans, and a greater number of masculine flowers.

Whether what Jussieu calls B. theophrastus be a new species, we have not at present the means of ascertaining; but the information in La Mark's figure we should rather call a race more than a spike.

The Brachia capensis, Mantissa, 18, 157, is judged by Professor Martyn to be probably the same tree bearing hermaphrodite flowers. La Mark pronounces it to be so without hesitation. Bosc makes no mention of it, either under brachia, or in a separate article. Linnaeus says, that though it resembles the bracbea, its fructification is altogether different. His description of it in Mant. 1. is as follows: Banchetis, rigid, purplish, fringed, subvillose. Leaves, seven in a whorl, petioled, lanceolate, rather rigid, a hand's breadth long, smooth above, reticulated underneath. Petioles, erect, pubescent. Aments, oblong, cylindric, petioled, round, erect, lateral, often two within each leaf, shorter than the leaves, rather rigid, two inches long, imbri cate. Scales, ovate, acute, pubescent, many-flowered. Corolla, funnel-shaped, five-cleft. Stamens, five. Style, one.

Propagation and Culture. This tree is propagated in Europe only by layers, and that with difficulty. The layers should be made of the former year's shoots, and slit at a joint, as is practised in laying carnations. The best time is in April, when the plants are beginning to shoot; but they will often be two years before they produce roots strong enough to be taken from the old plants. They must have little water given them, especially in winter. The plants must be placed in a good greenhouse in winter, but in summer should be set abroad in a sheltered situation. See Martin's Miller's Dict. The bracbea does not occur in the Hortus Kewensis.

BRABERUTUS, or BRACERUTUS, formed from Bracerus, prize, or reward; in antiquity, an officer who presided at the public games, and decreed the prizes to the victors. The Latins called him Praepositus, and munenarius. The generalness of writers confounds the bracereus with the agonotheta, between whom there however appears to have been this difference, that the former presided at the gymnastic combats, the latter at the sacred ones. The number of bracereus was not fixed; sometimes there was only one, but more commonly there were nine or ten.

BRACONIACUM, in Ancient Geography, a place of Britain, mentioned in the Nautica Imperii, and supposed by Mr. Horley to be the same with Bremetonicus.
clothing, and born in 1382, at Terranuova, a small town of the republic of Florence, not far from Arezzo. Deriving from his father no hereditary advantages of rank or fortune, he fought eloquence and dilution in the cause of literary pursuits. Having acquired a competent knowledge of the Latin and Greek languages at Florence, where his studies were directed by Manuel Cryoforos, he removed to Rome about the year 1402; and here his literary reputation introduced him to the notice of Boniface IX., who took him into his service, and promoted him to the office of writer of the apostolic letters. At the period immediately preceding the admission of Poggio into the pontifical chancery, the Italian states had been convulsed by war and faction; but a treaty having been concluded, just before his arrival, between Boniface and the Florentine republic, the Roman court, relieved from its distraction and anxiety, was become a scene of luxury and dissipation. Poggio, however, relished the temptations which presented themselves to his lively fancy and ardent constitution; and as the emoluments of his office afforded only scanty means of gratification, he devoted himself the more avidly to the prosecution of his studies, and to the cultivation of an acquaintance with those whose conversation might lead to the improvement of his mind. Literary pursuits were now become fashionable, and the character of the scholar was often found united with that of the man of the world. To this circumstance it is natural to ascribe the union of learning, politeness, and knowledge of the human heart, which shines so conspicuously in the writings of Poggio. In 1404 he sustained a considerable loss by the death of his patron, Boniface; but his distinguished merit recommended him to the favourite notice of the successor to the papal see, Innocent VII.; who continued him in his office, and treated him with particular kindness and respect. During the distractions of the Roman court, which succeeded the death of Innocent in 1406, Poggio exchanged the intrigues and dissensions of the pontifical palace for the tranquil delights of friendship, which he enjoyed at Florence in the society of its literary acquaintance, and particularly in the patronage and cordial esteem of the celebrated Niccolo Niccoli. He seems, however, to have retained his situation in the pontifical chancery; and having acted as apostolical herald to Alexander VI., he occupied the same office in the household of John XXII., that pontiff's succesor. At the council of Constance, in 1415, the death of Manuel Cryoforos, the instructor of his youth, gave him an opportunity of celebrating his praises in a funeral oration, and of dedicating to his memory an appropriate and elegant Latin epitaph. Upon the deposition of John at this council, and the consequent disfigurement of the pontifical household, Poggio remained at Constance, and employed his intervals of leisure in studying the Hebrew language, under the direction of a Jew who had been converted to the Christian faith. But in this language he seems to have made no great progress; nor, indeed, was he desirous of profusing himself, by a knowledge of the oriental tongues, with the weapons of religious controversy. As he was not disposed to call in question the prevailing creed, he was inclined to think that St. Jerome's translation of the Jewish Scriptures was amply sufficient for all the purposes of his Christian faith. Biblical studies seem not to have suited his taste and inclination; and therefore his proficiency in them was not very considerable. The vigour of his mind might likewise have suffered some relaxation from the precariouslyness of his situation, and the gloomy and disquieting prospects which presented themselves with regard to his future preferment. Finding no amelioration in varying or extending his literary pursuits, he altogether suspended his studies; and in the spring of the year 1416, he availed himself of the leisure afforded him, by the termination of his functions as secretary to the deposed pontiff, to make an excursion to the baths of Baden. On his return to Constance he was present at the trial of Jerome of Prague; and of this trial and the last end of Jerome he gave a very circumstantial and interesting account, in a letter to his friend Leonardo Aretius. "He stood undaunted and intrepid," says Poggio, "not merely contending, but, like another Cat he, longing for death. He was a man worthy to be had in everlasting remembrance. I do not commend him for entertaining sentiments hostile to the constitution of the church: but I admire his learning, his extensive knowledge, the gravity of his eloquence, and his ability in reply. But I am afraid that all these endowments were bestowed on him by nature, in order to effect his destruction." He thus concludes: "He may have been heretical in his notions, and obdurate in perverting them, but he certainly died like a philosopher. I have relented a long life, as I wished to employ my leisure, in relating a transaction which furphases the events of ancient history. For neither did Mutius suffer his hand to be burnt for patiently as Jerome endured the burning of his whole body; nor did Socrates drink the hemlock as cheerfully as Jerome submitted to the fire." The feeling manner in which he describes the trial and execution of Jerome, evinces a heart, which daily intercourse with bigotted believers and licentious hypocrites could not deaden to the impulses of humanity. The man, indeed, whose he took in the fate of a man, who was held up by the church as an object of unqualified abhorrence awakened the fears of Leonardo on his account; and he advised him to exercise a greater degree of caution. During the vacancy of the pontifical throne, Poggio improved his leisure by an expedition of so small importance to the interests of literature. Having received information that many ancient MSS. of classic authors were scattered in various monasteries, and other repositories in the neighbourhood of Constance, he determined to rescue them from the hands of those who, ignorant of their value, were sufferiing them to perish. In the monastery of St. Gall he found, among other MSS., a complete copy of Quintilian, buried in rubbish and dust; and also the three first and one half of the fourth books of the Argonatique of Valerius Flaccus, and Aenonianus Pidanius's comment on eight of Cicero's orations. In a monastery of the monks of Cluny, in the town of Langres, he found a copy of Cicero's oration for Cæcina; and in his other researches he discovered the following orations of the same author, the loss of which had been long deplored by the learned; viz. "De lege Agraria contra Rullum, lib. I. et lib. II.;" "De Agr. leg. Agr. ad populum;" and "In L. Pisonem." A copy of these orations is preserved in the abbey of Sta. Maria at Florence, with a memorandum ascribing the discovery of this and also of three others, viz. "Pro C. Rabirio Pisonfo;" "Pro C. Rabirio perduellionis reg.;" and "Pro Rufco comadeo," to Poggio; but the three last are torn from the volume. To him also, in concurrence with Bartolomeo di Montepelecano, we are indebted for restoring to light the poem of Silius Italicus, Lactantius's treatise, "De ira Dei et opificio hominis," Vegetius "De Re militari," Nonius Marcellus, Ammianus Marcellinus, Lucrécius, Columella, and Tertullian. Poggio likewise added to the eight comedies of Plautus, known before his time, twelve more; and by the affability of his own researches, and those of others employed by him, he discovered a fragment of Aulus Gellius, a copy of Julius Frontinus, "De aquæductis," and eight books of Firmicus's treatise on the mathematics. From Cologne he procured the fifteenth book of Petronius Arbiter; and to his exertions we owe
ew the entire work of Columella, the preservation of Calpurinus’s Bucolic, and the recovery of the works of Manilius, Lucius Septimius, Cæper, Eutychius, and Probus.

After the deposition of John XXII, Poggio remained for some time in suspense with regard to his future destination; and it does not appear that he held any office under Martin V, who was elected to the papal see, although, after the dissolution of the council of Constance in 1418, he travelled in the suite of the new pontiff to Mantua. At this time he paid a visit to England, in consequence of an invitation from Beaufort, bishop of Winchester; but disappointed in his expectations of preferment, adequate to his views and wishes, he impatiently waited a favourable opportunity of returning to his native country.

At length, viz., in 1420, when the diffusions respecting the pontificate were finally settled, and Martin V. was recognized as the true successor to the papal throne, Poggio arrived at Rome, and accepted the office of secretary, to which he was recommended by the cardinal of St. Eufebius. A quarrel having taken place between his two friends Leonardo Aretino and Nicolò Niccolò, he interposed as mediator, and succeeded in accomplishing a reconciliation. In 1429 he availed himself of an interval of tranquillity, in presenting to public notice his first literary production, which was a “Dialogue on Avarice,” and which seems to have possessed considerable merit. In this dialogue he took occasion very severely to satirize those Christian friars, who were distinguished by the title of “Fratres Observantiae,” a new order founded by Bernardo di Siena. This was followed, at a more advanced period of life, by a “Dialogue on Hypocrisy,” a composition which abounds in the keen sarcasms of polished wit, and in acute observations on the human character. In both these dialogues he boldly expresses the contempt he entertained for those ecclesiastics, who adopted the religious habit as a convenient cloak for the concealment of indolence or luxury; and who, by the mere appearance of extraordinary sanctity, endeavoured to attain that worldly honour which at the same time they affected to despise. The freedom with which he exposed the vices not merely of individuals, but of whole classes of religious hypocrites, manifested a great degree of virtuous resolution, and merited no mean praise. After the accession of Eugenius IV. to the papal throne, a contenc occurred between him and the council of Balli, which terminated in the deposition of the pontiff, and his flight to Florence; and Poggio, in attempting to follow him thither, was captured, and for some time detained in confinement. However, by the payment of a ransom, which his pecuniary circumstances rendered very oppressive, he was set free, and finally accomplished his retreat to Florence. During his residence in this city, he had an opportunity of telling his ardent attachment to the humble of Medicis, by entering into a literary contest, or rather a kind of lampoon war, with Filippo, an avowed enemy of that family, in which they seem to have vied with each other in inventing falsehoods of the most atrocious kind, and in disgracing their pages by the most malicious and indecent calumnies. This contest between two of the most learned men of the age was conducted in a manner, which, however it may have contributed to the amusements of their contemporaries, entails lasting disgrace on both parties, in the judgment of posterity. Poggio, soon after the termination of this contest, determined to fix his permanent residence in the Tuscan territory, and with this view he purchased a villa in the pleasant district of Valdarno. The Tuscan government favoured his purposes of retirement, and passed a public act, which exempted him and his children from the payment of all public taxes.

Poggio’s fortune was inconsiderable; but he contrived to render his humble mansion an object of attention to the lovers of the liberal arts, by the treasures of his library, and by a small collection of statues, which he dispersed in such a manner as to constitute a principal ornament of his garden, and the appropriate furniture of an apartment which he intended to dedicate to literary conversation. His attention seems to have been long engaged by the study of ancient sculpture; nor was he left unfruitfully in returning its relics from obscurity, than in searching for the best writers of antiquity. With this view he made a diligent survey of the ruins of ancient Rome, and inserted in the proemium to his dialogue, “De Varietatibus Fortunae,” a catalogue of the relics of Roman architecture, which has been introduced by Mr. Gibbon in the 7th chapter of his “Decline and Fall of the Roman empire.” Poggio’s researches extended beyond the precincts of Rome, and his zeal for the restoration of the monuments of ancient sculpture induced him to visit Crypta, Ferrata, Tufulum, Ferentum, Alba, Arpinum, Alatrium, and Tiburtum; and by means of friends he directed his researches to Rhodes, Greece, and other countries. While he was engaged in collecting ornaments for his rural residence, he was employed at the request of a friend, Scipio of Ferrara, in composing a dissertation on the comparative merits of Cæsar and Scipio; which he closed with the following general statement of his opinion, “that the youth of Scipio was distinguished by the purest morals, whilst the early years of Cæsar were rendered infamous by his vices; that the former, inspired with the spirit of patriotism, by his splendid military achievements refuted his country from destruction; and that the latter, prompted by ambition, too successfully exerted his extraordinary talents to effect the subversion of the commonwealth: that consequently, whilst Scipio was by no means inferior to Cæsar in the fame of his military exploits, he was greatly his superior in virtue, which alone constitutes the character of a truly great man.” Soon after the termination of a controversy which this publication occasioned, an event occurred which, in all the circumstances that attended it, reflects no great honour on the character of Poggio. At the age of 55, he married a young lady of a wealthy and honourable family in her 18th year; and to this alliance he sacrificed a mildness, by whom he had had 12 sons and 9 daughters, and, moreover, set aside a bull of legitimacy which he had procured for them, in order that they might be enabled to inherit his fortune. Not long after this event, in 1437, his friend Niccolo Niccolò died; and Poggio composed and published his funeral eulogium, in which are several traces of eloquence and pathos. Although Poggio devoted much of his attention to domestic duties, and to the improvement of his Tuscan villa, he found leisure to renew his disgraceful literary contest with Filippo; and to compose a work, which redounded much more to his honour, entitled “A Dialogue on Nobility,” and published in 1440. This was followed by his “Dialogue on the unlamented princes,” in which he dwells with so much energy on the vices of exalted rank, as to afford room for supposition, that resentment and indignation had at least as much influence in its composition as the suggestions of philosophy. However, the effusions of malignity that occur in this dialogue are interposed with precepts of found morality, and the historic details with which it abounds are both entertaining and instructive.

In 1444 he left Leonardo, the sole surviving companion of his youthful years; and on this occasion he published a funeral oration, which was at once dignified and pathetic.

Poggio, though he had held the office of apostolic secre-
tary under seven pontiffs, had never been promoted to any of the desired departments of the Roman chancery. But when Nicholas V. ascended the pontifical throne, his prospects were brightened; and he indulged the hope of spending the remainder of his days in a state of independence, if not of influence. With a view of improving his interest with the new pontiff, he addressed to him a congratulatory oration, which was recomposed by very liberal presents. This was succeeded by a defunct epistle, introducing to his patronage a dialogue: "On the vicissitudes of fortune," and the most interesting of Poggio's works, and inculcating maxims of sublime philosophy, enforced by a detail of splendid and striking events. Confiding in the pontiff, he also published the dialogue: "On hypocrisy," already mentioned. At the request, and under the patronage of Nicholas, he also contributed to the illustration of Grecian literature, by a Latin translation of the works of Diodorus Siculus, and the Epitome of Xenophon. During the plague, which raged in various parts of Italy in 1450, Poggio visited the place of his nativity; and availing himself of this interval of relaxation from the duties of his office, he published his "Libri Facetarum," or collection of jocose tales, containing anecdotes of several eminent persons who flourished during the 14th and 15th centuries. This work acquired a considerable degree of popularity, and was read, not only in the native country of its author, but also in France, Spain, Germany, and Britain. In 1451 he dedicated to the cardinal Prosper Colonna, his "Pictor's delectative con- vivalia." In 1453 Poggio was elevated to the chancellorship of Florence, and at the same time, he was chosen one of the "Factor dignitatis," or presidents of the trading companies. These offices he held till his death, which happened on the 30th of October, 1456. Notwithstanding the multiplicity of his business, and the advance of age, he pre- cipated his studies with his accustomed ardour; and published a dialogue: "De saecularis humanae conditionis," and a version of Lucian's: "Alex," with a view of establishing a point of literary history, which seems to have been till that time un- known, namely, that Apollonius was indebted to Lucian for the fancies of his: "Amus aures." The last literary work in which he engaged, was his "History of Florence," divided into eight books, and comprehending the events in which the Florentines were concerned from the year 1355, to the peace of Naples in 1455. This history was trans- lated into Italian by Jacopo, the son of Poggio; but the original was published by Recanati, and has been republished in the collections of Gravina and Muratori. Poggio concluded his career in the possession of universal respect, and in the tranquil enjoyment of local and domestic comforts. His remains were interred with solemn magnificence in the church of Santa Croce at Florence; and his fellow citizens paid him their respect for his talents and virtues, by erecting a statue to his memory on the front of the church of Santa Maria del Carmine. As the citizen of a free state, which he deemed a high honour, he improved every opportunity that occurred for increasing and displaying the glory of the Tuscan republic. Although he was honoured by the favour of the great, he never sacrificed his independence at the shrine of power, but uniformly maintained the ingenuous sentiments of freedom. The licentiousness which disfigured the early period of his life, and the indecent levity which occurs in some of his writings, were rather the vices of the times than of the man; nor did they deprive him of the counte- nance of the greatest ecclesiastical dignitaries, or cause him to forfeit the favour of the pious Eugenius, or of the moral and accomplished Nicolas V. To those with whom he main- tained a personal intercourse, he recommended himself by the urbanity of his manners, the strength of his judgment, and the sportiveness of his wit. As a scholar, Poggio is entitled to distinguished praise. By affuluous study, he be- came a considerable proficient in the Greek language, and intimately conversant with the works of the Roman classick authors. In selecting as his exemplar in Latin composition, the style of Cicero, he manifested the discernment of true taste. When compared with the works of his immediate predecessors, the writings of Poggio are truly affluishing. "Rising to a degree of elegance, to be sought for in vain in the rugged Latinities of Petrarca and Coluccio Salutati, he prepared the way for the correctness of Politiano, and of the other eminent scholars whose gratitude has reflected such splendid lustre on the character of Lorenzo de' Medici." Shepherd's life of Poggio Bracciolini. 4to. 1603.

BRACE is commonly taken for a couple, or pair; and in this sense is applied to huntingmen to several beasts of game; as a brace of bucks, foxes, hares, &c. They also say, a brace of greyhounds.

Brace, in Architecture, denotes a piece of timber framed in with bevel-joints; serving to keep the building from swerving either way. When a brace is framed into a king-piece, or principal rafter, it is called by some a frut.

Brace, Bracchio, or Brasse, in Meatal joinery, denotes a foreign long measure, answering to our fathom.

Brace is also used for a measure taken from the length of the arm when extended, and is used in divers cities of Italy, in lieu of the foot or yard. Its length is various: the brace of Bergamo, according to Seamozzi, is nineteen Paris royal inches, and a half; according to M. Petit, fifteen inches two-thirds; the brace of Bologna is fourteen inches; that of Dreffe, seventeen inches seven lines and a half, according to Seamozzi; and according to M. Petit, seventeen inches five lines; the Mantuan brace is seventeen inches four lines; that of Milan, twenty-two inches; those of Parma, twenty inches one-third; of Sienna, twenty-one inches two-thirds; of Florence, twenty inches two-thirds, according to Maggi; twenty-one inches four lines and a half, according to Lorini; twenty-two inches two-thirds, according to Seamozzi, and twenty-one inches one-third, according to Picart.

Brace, in Writing, a term used to signify a crooked line, (as I) made at the end of two or more articles in an ac- count, the amount of which is usually placed in the centre of the brace. It is also used in printing, to enclose an entire paragraph in a triplet, &c.

Brace the yards in, in Sea-language, signifies to move them, by means of the braces, to any direction required. To brace about, is to brace the yards round for a contrary tack. To brace fipg, is to brace the yards in a position, in which they will make the least possible angle with the keel, for the ship to have head-way. To brace in, is to safe off the lee- braces, and round-in the weather braces, to assist the motion of the ship's head in tacking. See the next article.

Brace, a rope at each extremity of all the yards of a ship, except the mizen yard, which is provided with ropes called rangs, for the purpose of bringing the yard in a proper position, that the sail may be full, whether the ship is lying, or large. All braces ought, if possible, to lead aft, for the greater security of the masts; in ships, therefore, the braces of the yards belonging to the fore and main-masts lead ast; but in square-rigged vessels with two masts, those, only, of the yards belonging to the foremost, lead ast. The braces of the yards of the after- mast of a square rigged vessel, lead forward. The braces of the principal yards are double, being recived through blocks,
blocks, at the ends of the yards, or at pendants fixed to the yard-arm. The braces of the top-gallant, and sprit-fall yard-arms, are angles.

BRAIDED, in Heraldry, is used in speaking of chevronnels which are intermingled. He bears a chief or, and these chevronnels braided, in the base of the escutcheon, by the name of Five-High. See Braid.

BRACELET; an ornament usually wound round the wrist. The word is French, bracelet; which Menage derives farther from bracteatum, a diminutive of bracte, a word occurring in writers of the Julian time; all formed from the Latin brachium, arm. It amounts to the same with what was called by the ancients, armilla, brachiale, eccetus; in the middle ages, boga, boga, armpepta.

Among the ancient Romans, the men as well as the women wore bracelets; but the latter, it is to be observed, never wore them till they were betrothed.

In the times to which the Scripture history refers us, the bracelet seems to have been an ensign of royalty; and this accounts for Saul's wearing this ornament at the time of his death, and for the Amalekite's bringing the bracelet which he found on Saul's arm, together with his crown, to David. 2 Sam. i. 10. It is well known, that the bracelet has been at such later times used in the East as a badge of power. D'Herbelot informs us, that when the caliph Caicm Bemrnillah granted the investiture of certain dominions to an eastern prince, which his predecessors had possessed, and among the rest of the city of Bagdad itself, this ceremony of investiture was performed by the caliph's sending him letters patent, a crown, a chain, and bracelets. Although Grotius, referring to Num. xxxxi. 50, observes, that the bracelet was an ornament used by the men as well as women of those nations; yet it does not seem to have been so common as some writers have supposed: for though the word bracelet frequently occurs in our translation, the original word in this text is found only in two other places; and as the children of Israel found one or more of these bracelets among the spoils of Midian, so they killed, at the same time, five of their kings. Num. xxxiii. 8. In the other passage, if. ii. 20. mention is made of female ornaments; but allowing the word to be the same, might not the women of that age wear an ornament which, from its likeness to one of the ensigns of royalty, might be called by the same name. We read in Gen. xxiv. 22. that the bracelets of Rebekah weighed ten shekels, or about five ounces; a weight which some have thought to be very extraordinary. But Sir John Chardin affirms us, that ornaments so heavy, and even heavier, were worn by women of the East when he was there. He says, with a reference to the ornaments of Rebekah, that the women wear rings and bracelets as of great weight, through all Asia, and such as are much heavier. They are rather much heavier than bracelets. There are some as large as the finger; the women wear several of them, one above the other, in such a manner as sometimes to have the arm covered with them from the wrist to the elbow. Poor people wear as many of glass, or horn. They hardly ever take them off; they are their riches.

Bracelets were at first properly military ornaments or rewards, frequently conferred among the ancients, by generals and princes, on those who behaved gallantly in fight. They became afterwards arbitrary decorations, affixed at pleasure; and are sometimes said to have been worn for health as well as ornament; and particularly as amulets, to break the force of charms and incantations. Among the Romans, we meet with divers species and denominations of bracelets; as the bracchalis, which covered the whole length of the arm; the destralis, or destruxherium, only the wrist, and that only of the right arm; viria, or circlet, peculiar to the male sex; spinulum, to the women, being worn on the left arm; corvus, used as an amulet; amphibolus, worn either on the arm, or about the neck; calicium, or galerum, worn by generals in their triumphs. Luc. Lex. Ant. tom. i. & ii. Du-Cange. Gloss. Lat. tom. i. & ii. Renart. Rom. Ant. Not. V. II. hist. iv. cap. 16.

Bartholin has a treatise on the bracelets of the ancients. The northern people used also to wear on their bracelets, to render contracts more inviolable.

Bracelets are still much used by the savages of Africa and America, made of meat, glasses-beads, shell, and the like. In civilized countries they form a common part of the ornaments of the ladies.

BRACELET is also used, in Anatomy, to denote the circular ligament which invests the corpus, called also ligamentum annulare.

BRACELETS; in some Ancient Law Books, denote beagles, or bounds of the smaller kind.

BRACES, in Geography, are two sand-banks lying across the entrance into the channels for the river Hugli, at the bottom of the bay of Bengal.

Braces, in Ship building, that security to the rudder which is fixed to the stern-pole, and bottom of the ship, and to which the rudder is hung.

Braces of a couch, denote the thick and strong strips of leather on which it hangs.

BRACHERIUM, or BRACHERIOLUM, a kind of fleri bandage worn about the hips, and used for the retention and cure of ruptures. Du-Cange Gloss. Lat.

BRACHIAEUS, or BRACHIALIS, internus, mufculus, in Anatomy, is the deeper situated flexor of the elbow joint. It arises fleshy from the middle of the os brachii, and from all the lower and fore part of the bone. It crosses over the joint, and adheres firmly to the ligament. It is invested by a fibrous ftring joining the coronoid processes of the ulna. Its use is to bend the fore arm, and to prevent the capitule of the joint from being pinched.

BRACHIALIS, coraco. See NERVES.

BRACHIALIS, coraco. See CORACO-BRACHIALIS.

BRACHIATE, in Botany, a term applied to branches when they grow opposite to each other, one on each side of the stem, and when each pair points in a different direction so as to make a right angle with the pair above or below it.

BRACHIOBOLUS, a name given by Allioni to a genus of plants formed for such species of sisyphrium as have a short spike. It corresponds with Haller's radica. See SYDRERMUM.

BRACHIUM, in Ancient Geography, Gerba, an island in the Mediterranean sea, situate on the coast of Africa, 15 leagues S. E. of Tazacor. Scylax.

BRACHIONUS, in Zoology, a genus of Vermes infusoria, having the body contractile, covered with a shell, and furnished with ciliate rotatory organs at the head. The species of this genus Linnaeus includes in his genus Veritcula, from which they are distinguished by modern naturalists by the spiny covering of the body; the vorticella being definite of a shell.

The species of this genus are urceolariis, patella, irus, cirratus, tripus, uncinatus, muronatus, cernua, calyciflorus, tubificz, quadridentatus, and patina, which see.

BRACHIPE, in Ecclesiastical History, a branch of Manichees, who appear in the third century.

BRACHIUM, the arm. in Anatomy, is that part of the upper extremity which intervenes between the joints of the shoulder and elbow.

BRACHIUM,
BRACHIA.

**Brachium** in Botany, a term employed by Linnaeus as a measure of plants. It denotes the distance from the summit to the base of the middle finger in a middle-sized man, and is about 24 inches.

**Brachium versum fauculis,** in Anatomy, a name given by Vesalius, and other of the old writers, to the muscle now generally called deltoid.

**Brachium ventriculi quinste,** the name by which Vesalius calls the muscle generally known under the name of *trunci falcis.* Fallopius, and many others, have also called it *fascia humeri.*

**Brachium inferius,** a name given by Vesalius and others to a muscle since called, from its shape, *tector major,* and *rectus major.*

**BRACHYURE,** in Zoology, an epithet given by the French naturalists to many animals that have short wings, the word being derived from the Greek as in Brachypus, e. c.

**BRACHYERCHE, FRISCH,** in Ornithology, *Alauda campstris,* the meadow lark.

**BRACHMANS,** a branch of the ancient Gymnosophists, or philosophers of India, remarkable for the severity of their lives and manners. See Gymnosophist.

The Greeks usually give them the name Gymnosophists; but among ancient authors, both Greek and Latin, we find different accounts of these Indian sages. Ptolemy considers them as distinct from the Gymnosophists; and he places the Brachmans, whom he calls Magi, in a southern district of India, between the rivers Solanus and Chaberus, not far from the sea; whereas he assigns to the Gymnosophists a situation in the north-eastern part of that country, near the western bank of the Ganges. On the other hand, Megasthenes, cited by Strabo, (Geog. tom. ii. p. 1938) affirms, that the Gymnosophists were divided into two branches or sects, viz. the Brachmans and the Germans. Diodorus Siculus, in one place, represents the philosophers of India, who were the Brachmans of Megasthenes, as equivalent to the priests of other nations; but, in another passage, he considers them as a separate nation, sect, or body of men, settled in one particular part of India. Arrian (De Expd. Alexand.) fixes the Brachmans among the Malni and the Mucceani; and Pliny, (Nat. Hist. 1. 6. c. 17.) says the appellation Brachman was applied to many nations, and intimates, that it did not denote a distinct class or order in society. Porphyry (De abstin. I. 4.) affirms, that the Gymnosophists were divided into two sects, the Brachmans and the Sarmatians; and that of the Brachmans, some lived in a mountainous tract, and others about the Ganges. Arrian, Anuleius, Clemens Alexandrinus, and Plutarch, differ in several particulars relating to these Indian sages; though they all seem to agree in celebrating their love of divine wisdom, their knowledge, their abstemious way of life, their singular temperance, and their contempt of all the good, as well as evil things of this world, so much defied or dreaded by the bulk of mankind. Upon the whole, it seems to be evident from various records, concerning the ancient Brachmans, that they were not so much a distinct nation, or particular class of philosophers, as a tribe or body of men, or rather a numerous family, descended from one common ancestor, who existed at some remote period, and who was different from the progenitors of the people among whom they lived. They deduced their origin from Brahma, the first of the three beings whom God created, and whom he afterwards employed as his agents in forming the world. Some have supposed that this Brahma was the supreme being; but others have rejected this supposition as absurd and incredible. It has been a generally received opinion among some of the best Jewish writers, adopted by Sherefan, an Arabian author of great repute, and sanctioned by the authority of the learned Dr. Hyde (De rel. ver. Pers. p. 343.), who has offered some ingenious conjectures in defence of this notion, that the progenitor of the Brachmans was the patriarch Abraham, whom in their language they call *brahma, or brama.*

Polellus (In comm. ad Jezeb.) takes these Brachmans to have been descended from Abraham by his wife Keturah, whence he calls them *Abrahamites;* and believes that the true religion prevailed among them; and, indeed, from the accounts given of them by the ancients, it seems to appear, that they acknowledged one supreme being, and a future state of rewards and punishments. It also farther appears, that some of them worshipped this supreme being with great fervency and adoration, spending the greater part of the day and night in singing hymns in honour of the deity, praying and fasting almost incessantly, and defiling every thing in this world for his sake. Hence, some have derived their name from the Hebrew *bra-* or *pray,* because this was their principal occupation. Most of them lived in solitude, without marrying, or polluting any effluvium: and from this circumstance of their retiring into the country and living in deserts, P. Thomassin deduces the original of the appellation by which they are distinguished; supposing it to have been derived from the Hebrew *bra-* or *pray,* or *sigh.* These Brachmans, according to the accounts of Arrian and Porphyry, were held in great veneration in their own country, enjoying perfect liberty and total exemption from taxes, and officiating, not only as the priests of the Indians, but likewise as the principal councilors of their princes. Thus they served their country, both in a civil and religious capacity, as the Magi did among the Persians. They affixed at the public sacrifices; and if any person desired to sacrifice in private, one of them must be present, otherwise the Indians were persuaded they would not be acceptable to the Gods. It was their peculiar province to consult the Rasa, and to practice divination. According to Strabo's account, they believed that the world had a beginning, and that it will have an end; that its form is circular; that it was created by God, who presides over, and fills it with his majesty; and that water is the principle of all things. With regard to the immortality of the soul, and the future punishment of the wicked, they followed the doctrine of Plato; intermixing it, like that philosopher, with some fictions, in order to express or describe those punishments. The Brachmans are celebrated all over the ancient world for their wisdom, the austerity of their lives, and their invincible fortitude and patience. Their food consisted altogether of herbs, roots, and fruits, and their drink was water. They wholly abstained from the flesh of animals, and thought themselves defiled by touching them; they thought it highly criminal to deprive the most inconsiderable animal of life; and as they held the doctrine of the Metempsychios, they supposed that the souls of men transmigrated into those of brute animals. Pythagoras is said to have studied their doctrine and maners, and to have received his notion of the transmigration of souls, or Metempsychios, from them. Persuaded that it is below the dignity of a man to wait calmly for death, when he finds himself oppressed by age or afflictions, they carelessly with for the moment when the soul shall leave the body, and hold it to be glorious and laudable to preclude the approach of their last hour, and to burn themselves alive. Among them, no honours were paid to those who died merely of old age; and they conceived, that their funeral pile, and the fire that was to reduce them to ashes, would...
be polluted if they did not move to it with a firm and
quick step, and ascend it with fortitude and animation.
Cicero, in his Tusculan Questions, (I. v. n. 78.) expresses
his admiration of the invincible patience, not only of the
Indian fages, but also of the women of that country, who
used to contend for the honour of dying with their common
husband. This privilege was reserved for that wife to
whom the husband was most affectionately attached; and
it was decided in her favour by the sentence of persons ap-
pointed for that purpose, who never pronounced judgment
until they had made a strict examination, and heard the alle-
gations on all sides. The wife, who was ultimately pre-
ferred, ran to meet death, and ascended the funeral pile
with incredible firmness and joy; whilst the surviving wives
withdrew with the most deprewing regret and sorrow, and
with their eyes bathed in tears. Some of the Brahmans,
however, lived in cities, and associated with their own spe-
cies; and so far from confederating suicide, or a premature
surrender of themselves to death, as a virtuous and brave
action, they looked upon it as a weakness in man not to
wait patiently the stroke of death, and as a crime to antic-
unate the will of the Gods. The Brahmans were all of one
tribe; and in this respect, they differed from the Gymno-
osophists, and particularly from the Sammanans, who might
have belonged to any family or Indian tribe. They formed
the first and principal of the four castes that subsisted
from time immemorial among the Hindoos, and that were sup-
posed to be derived from Brahma. See CAST.

In ancient times it should seem, that the Brahmans were
not hereditary, or a distinct Levitical tribe; but that any mem-
er of the other castes might enter into this order, which was
of course deemed inferior to the chief secular or military cast.
But in latter times the caste has been very different; for
the meanest Brachman will not now condescend to cat with his
sovereign. The Brahmans from the time of their birth
were put under guardians; and as they grew up, had a
succession of instructors. They were in a state of pupillage
till 36 years of age; after which they were allowed to live
more at large, to wear fine linen and gold rings, to live upon
the flesh of animals not employed in labour, and to marry
as many wives as they pleased. Others of them submitted,
through their whole lives, to a stricter discipline, and passed
their days upon the banks of the Ganges, with no other
food besides fruits, herbs, and milk. The rigours practised
by the Brahmans are almost incredible, and would hardly
be believed, if they were not attested by the best authorities,
and by the reports of modern travellers concerning the cru-
culies, penalties, and even tortures, which are commonly
practised without scruple by the Indian Brahmans. Pliny
relates, (N. H. l. vii. c. 2.) that some have fixed with their
eyes steadfastly upon the sun from morning to night,
and that others have remained, in one and the same painful
posture, upon the burning sands, for whole days. For a
further account of the tenets and practices of the ancient
Brahmans, see Gymnosophists and Samanians.

Among those Brahmans, that are mentioned with parti-
cular respect by the Greek writers, who treat of the time
when Alexander visited India, and particularly by Strabo,
(geog. l. 14. c.) are Mandanis and Calmanis. The former is
celebrated for the boldness with which he cenured the in-
temperance and licentiousness of Alexander and his army,
in a conference which he held with Onefericus. The latter,
when he saw Alexander’s messengers clothed with fine linen
garments and elegantly adorned, laughed at their effemi-
nity, and requested them, if they wished to hold any con-
ference with the Brahmans, to lay aside their ornaments,
and, like them, recline naked upon the rocks. Of him, it
is also related, that when he found the infirmities of age
coming upon him, he devoted himself to voluntary death,
and ascending the funeral pile, said, “Happy hour of de-
parture from life, in which, as it happened to Hercules, af-
aer the mortal body is burned, the soul shall go forth into light!”

The modern Brahmans of Hindostan derive their name
from the ancient Brachmans, and pretend to derive their
doctrine and practice from the same origin. In sever-
ral particulars, the resemblance is manifest; and although
much inferior, both as philosophers and men of learning,
to the reputation of their ancestors, as priests their reli-
gious doctrines are still followed by the whole nation,
and as preceptors they are the source of the greatest part of
the knowledge which exists in Hindostan. However, Sir
William Jones, and several other intelligent authors on that
subject, caution us against confounding the ancient Brach-
man with the modern Brahmans. The religion of Bouddha,
(see Boou and Birman empire,) still retained by the
Birmans and other adjacent nations, it is said, was the real
ancient system of Hindostan; but the artful Brahmins have
introduced into it many innovations, in order to increase
their own power and influence. If the conjectures of Sir
William Jones, relative to the inscriptions found at Mon-
guerto, and on the pillar at Buddha, (Asian Researches, vol. i.
p. 123, &c. 8vo.) be well founded, it appears that the
governing power on the banks of the Ganges, as late as
about the time of the birth of Christ, belonged to the feft
of Bouddha. Although the Brahmans had then introduced
themselves into Hindostan, and had obtained lands, and
even the rank of prime minister to the great Rajah; they had
not persuaded him to change his religion, a change which,
when accomplished (says Dr. Buchanan, Asiatic Ref. vol. vi.
p. 165.) proved equally destructive to the prince, and to
the people. He adds, “however idle and ridiculous the
legends and notions of the worshipers of Bouddha may be,
they have been in a great measure adopted by the Brahms,
but with all their defects monstrosly aggravated: rajaks
and heroes are converted into gods, and impossibilities are
heaped upon improbabilities. No useful science have the
Brahmans diffused among their followers; history they have
totally abolished; morals they have deprewed to the nm-
most; and the dignity and power of the altar they have
erected on the ruins of the state, and the rights of the sub-
ject. Even the laws attributed to Menu, which, under the form
in use among the Burmas, are not ill suited for the purpose
of an absolute monarchy; under the hands of the Brahms
have become the most abominable and degrading systen
of oppression, ever invented by the craft of designing men.”
From the account which Mr. William Chambers has
given of the sculpture and ruins at Malavipurum, (Asiat.
Ref. vol. i. p. 160, 161.) we have very good reason for
believing, that the worship of Bouddha once extended
over all India, and that it was not rooted out by the Brahmas
in the Decan so late as the 9th, or even the 12th century of
the christian era. Dr. Buchanan observes, (Asiat. Ref. vol.
p. 163.) that this opinion of the late introduction of the
superstition now prevailing in Hindoostan is not contradicted
by the almost singular remain of the Hindo history; the only
one which has escaped the destructive research of the cunning
Brahma; i.e. the history of Cashmere preferred to the sultan
Akber on his first entrance into that kingdom. We are
told, (Ayee Akaibry, ii. 175.) that the Sultan caused this
book to be translated, and of this translation Abul Fazil
has given an abridgment. This informs us, that when
Cashmere was freed from an inundation, by which it had
been covered, a certain Kuhup brought the Brahmas to
inhabit the new land; that, after a long time, a general
assembly
assembly of the inhabitants was called, who elected a man celebrated for his virtue to be their king; and that from thenceforward monarchy was established in that delightful region. The name of the first successor to this king, that is mentioned, is Owingun, contemporary with Kithen; referred by Dr. Buchanan to the year before Mahomed 879, or B. C. 448. These Bramins, whom Kalkh brought to Cailmere, could not, our author apprehends, be the Bramins of the prophecies, as they cultivated the earth, and were the only inhabitants of the country; but they must have been one of the Brachin nations, several of which, according to Pliny, were dispersed over India; and these again, he conjectures, are the same with the Bramins of the Rig Veda, satisfied by them to have been the first inhabitants of the earth. "That must be the meaning of the history of Cailmere (he says) seems plain; as we are told, rajph Jannick the 45th prince, and who, according to my theory, must have lived about the year of Christ 292, established in his reign the Brahmy rites. His successor Jelowk, the most powerful of the princes of Cailmere, tolerated the doctrine of Bolwids; and in that delightful valley it was not till the reign of Nerh, the 59th prince, A. D. 342, that the Brahmins got the better of the followers of Bolwids, and burned down their temples." In process of time, as the Brahins, or priests of Godama, in the Birman empire, were entirely prohibited the study of astrologers, and as the people were much addicted to all kinds of divination, the Bramins availed themselves of their credulity, and established themselves in considerable numbers all over India beyond the Ganges. It does not seem, however, that they have any concern in the religion of those countries; but they are merely employed about the courts, and in the houses of the great, as the Chaldeans were about the kings of Persia, as chief-layers and oracles. They annually compose almanacks; they perform incantations, under the throne of the king, before an audience is given on solemn occasions; they are consulted in all matters of importance, for determining the fortunate hour or season in which they ought to be undertaken; and they bellow on their protectors, amulets, charms, and such trifles. By such means the Bramins have rendered themselves important and useful in the Birman empire, and have obtained many privileges, confirmed even by the written law of the kingdom. However, their introduction into the Birman kingdom is a very recent event. The knowledge of the Birman Bramins is chiefly confined to astrology, and it is said, that they are very ignorant of astronomy; in so much that, when they attempt to calculate eclipses, they do not pretend to ascertain either the hour of their commencement, or the extent of the obser:

It is also asserted that the Bramins of Hindostan are not much farther advanced in science than those of Amaraapura, notwithstanding the improvements they have introduced from time to time, as they were able to procure information from their conquerors, Mahomedans and Christs.

The lunar zodiace, in use among the Bramins, has been exhibited by Sir William Jones, (Af. Ref. vol. ii. 291, &c.) and is supposed to have been communicated to the Birman from Chaldea by the intervention of the Bramins; nor is it unreasonable to imagine that the Bramins have derived astronomical knowledge from the Greeks and Arabs.

The religion of the Bramins, according to the opinions maintained by Paulinus and Sir William Jones, is essentially the same with that of the Egyptians; and M. Anquetil du Perron concurs with the latter in supposing that Egypt was the source from whence the Bramin worship has been spread over a great part of the Eastern world. The Bramin priests in India adopted and extended it, and, as we have already observed, gained a superiority over the priests of Bouddha about the time of Christ; and about 900 years afterwards, they totally overthrew his doctrine in its native country. The Vedas, which are the oldest books of the Bramins, are inferior in antiquity to the time of Bouddha, because they mention the name of that personage. Against the Egyptian origin of the Brahminical worship, the cosmogony of the Bramins has been adduced: this is nearly the same with that of the Rahans, and seems to have been framed in the north of Hindostan. However, we may reasonably suppose the Bramins to have been a colony of Egyptians, who formed their first establishment in the vicinity of Bombay; as the images in the cave at Elephants (which see) seem to those of the gods of the Bramins. By degrees they engraven their superstition on the ignorance of the Hindoos, adapting the African deities and mythical philosophy to the Asiatic fables and heroes, and cautiously introducing the Egyptian cast and ceremonies, with all their dreadful concomitances. Some have supposed, that the religion of the Bramins was introduced from Egypt into India as early as the time of Seekar; but to this opinion it has been objected, that the object of his military expeditions, if indeed we allow their reality (see Seckar), appears to have been plunder, and the capture of slaves, rather than the propagation of religion or philosophy. The perfections of the Egyptian priests by Cambyses is an event more likely to have produced an extensive migration into India; nor is it improbable that the Egyptians, who before this time traded to India, might have communicated some knowledge of their science to the Hindoos.

Whatever was the precise era of the introduction of the Bramins into India, it seems to be unquestionable, that, in the usual course of human affairs, a contest arose, at some period or other after their settlement, between the regal and ecclesiastical powers. The latter, instead of being subdued, as in China and Japan, acquired the superiority, as in Tibet. But in Hindostan, from a most refined and cunning policy, the priesthood averted the divine institution of the several gods (see Cast), and, in the natural progress of their power, pronounced their own to be the supreme, and possessed of innate and hereditary sanctity. It seems to be allowed that Bouddha was a deified philosopher; and it is also probable, that Brahma was the sophist who invented the new casts, and was not only deified, but placed in the first rank of the gods, by the grateful priesthood, which assumed the sole direction of the national mythology. The chief modern deities of the Bramins are Brahma, villainus, and Siva, i.e. the creator, the preserver, and the destroyer, corresponding to the three characters under which the Greeks represented their Zeus or Jupiter. But the fundamental principle of the whole fabric of Indian mythology, conformable to the universal system of the cast, was the belief in a supreme creator, too inefable and sublime for human adoration, which was therefore addressed to inferior, but great and powerful divinities. The names and attributes of the gods and goddesses (for the voluptuous Hindoos delight in female divinities), are very numerous, and, as human ideas and objects are most universally the same, correspond in many instances with the Greek and Roman polytheism. The chief divinities of the Hindoos are well represented in Sonnerat's decorated publication; and we have an elaborate account of them in a tract "On the Gods of Greece, Italy, and India," published in the first volume of the Asiatic Researches, p. 221—275.
the most sacred; and to them belongs the province of studying the principles of religion, performing its functions, and cultivating the sciences. They have been for a long time, whatsoever be their origin, and whether it be more ancient or more modern, the priests, the instructors, and the philosophers of the nation. Such is the superiority of their cast or order, even to that of the monarchs of India, with regard both to rank and facility, that they would deem it degradation and pollution, if they were to eat of the same food with their sovereign. Their pursons are sacred, and even for the most heinous crimes they cannot be capitaly punished; their blood must never be shed. On important occasions, it is the duty of sovereigns to consult them, and to be directed by their advice, as was the case with respect to the ancient Brahmins. Their admonitions, and even their counsels, must be received with submissive respect. From some accounts preferred in India of the events which have happened in their own country, we find, that princes, who violated the privileges of the cast, and disregarded the recommendations of the Brahmins, have been deposed by their authority, and put to death. The discoveries of modern times, procured and furnished by those who have visited India during the course of the three last centuries, afford us a considerable degree of authentic information concerning the state of science among the Brahmins. The distinction between matter and spirit appears to have been known at an early period by the philosophers of India; nor can any description of the human soul be more suited to the dignity of its nature than that given by the author of the "Mahabarn," an epic poem, in high estimation among the Hindoos, composed, according to their account, by Kreekitha Dwypayan Vicas, the most eminent of all their Brahmins, above 3000 years before the Christian era. This poem contains more than four hundred thousand lines. Mr. Wilikins has translated above a third part of it; but only a short epitome, entitled "Baghvat-Geeta," is published. "Some," says the author, "regard the soul as a wonder; others hear of it with astonishment; but no one knoweth it. The weapon divideth it not; the fire burneth it not; the water corrupteth it not; the wind driveth it not away; for it is indivisible, incomposable, incorruptible; it is eternal, universal, permanent, immutable; it is indivisible, incomposable, and unalterable." With regard to the knowledge of logic and metaphysics, for which the Brahmins have been celebrated, we learn from Abul Fazl's compendium of the philosophy of the Hindoos in the Aycen Akyber (vol. iii. p. 95, &c.); from the speciments of their logical discussions contained in that portion of the "Shaster," published by colonel Dow (Dissertation, p. 39, &c.); and from many passages in the Baghvat-Geeta; that the same speculations which occupied the philosophers of Greece had engaged the attention of the Indian Brahmins; and the theories of the former, either concerning the qualities of external objects, or the nature of our own ideas, were not more ingenuous than those of the latter. That sceptical philosophy, which denies the existence of the material world, and affords nothing to be real but our own ideas, seems to have been known in India as well as in Europe; and the fates of the East, as they were indebted to philosophy for the knowledge of many truths, and were able to define with accuracy, to distinguish with acuteness, and to reason with subtlety, were not more exempt than those of the West from its delusions and errors. To the subject of ethics the Brahmins had directed particular attention; and their sentiments seem to have been various; so that, like the philosophers of Greece, they were divided into sects, distinguished by maxims and tenets often diametrically opposite. From several passages that occur in the Baghv at Geeta we may infer, that the distinguishing doctrines of the Stoical school were taught in India many ages before the birth of Zeno, and inculcated with a persuasive earnestness nearly resembling that of Epictetus. From India the western world derived their knowledge of the modern mode of notation by 10 cyphers or figures, which have been universally adopted, and found so convenient for performing every operation in arithmetic with the greatest facility and expedition. (See Arithmetic.) The astronomy of the Indians affords a proof still more conspicuous of their extraordinary progress in science. To M. de la Loubere, on his return from an embassy to Siam, A.D. 1657, we are indebted for an extract from a Siamese MS. which contained tables and rules for calculating the places of the sun and moon. The epoch of these tables corresponds to the 15th of March, A.D. 638. Another set of tables was transmitted from Christianobum, in the Carnatic, the epoch of which answers to the 16th of March, A.D. 1491. A third set was brought from Narrpou, the epoch of which is between the 17th and 18th of March, A.D. 1566. The fourth and most curious set of tables was published by M. Le Gentil, who received them from a learned Brahmin of Trivalore, on the Coromandel coast. The epoch of these last tables is very ancient, and coincides with the beginning of the celebrated era of the Collee Jogne, which, according to the Indian account, commenced 302 years before the birth of Christ. The calculations of M. Bailly, founded on these four sets of tables, have been verified by Mr. Playfair, who has also illustrated and extended his reasonings, in a learned dissertation published in the Transactions of the Royal Society of Edinburgh, vol. ii. p. 137. From the inquiries, reasonings, and calculations that relate to Indian astronomy, it has been inferred, that the motion of the heavenly bodies, and more particularly their situation at the commencement of the different epochs to which the four sets of tables refer, are ascertained with great accuracy; and that many of the elements of their calculations, especially for very remote ages, are verified by a surprising coincidence with the tables of the modern astronomy of Europe, when improved by the latest and most nice deductions from the theory of gravitation. The Indian Brahmins annually circulate a kind of almanack, which contains astronomical predictions of some of the most remarkable phenomena in the heavens, such as new and full moons, the eclipses of the sun and moon; and they seem to profess certain methods of calculation, that involve a very extensive system of astronomical knowledge. M. Le Gentil, while in India, had an opportunity of observing two eclipses of the moon, which had been calculated by a Brahmin; and he found the error in either to be very inconsiderable. The method of calculating eclipses, adopted by the Brahmins, is very different from that which was practised among rude nations in the infancy of astronomy, and founded on an analysis of the motions of the sun and moon, which indicate a considerable acquaintance with these motions. Indeed, the modern Brahmins, though they are guided in their calculations by scientific principles, do not understand them; nor are they acquainted with the method of constructing the tables, to which they recur in their computations. Of course the ancient Brahmins, who constructed the tables and rules now in use, must have possessed an extensive and tolerably accurate acquaintance with the elements of geometry, and also with the principles of plain and spherical trigonometry. See Benares.

With regard to the religious institutions of the Brahmins, they seem to be artfully contrived with a view of extending their own authority, and maintaining their influence over the people. They form, indeed, a regular and complete system of superstition, strengthened and upheld by every circumstance that can excite the veneration, and secure the attach-
The temples consecrated to their deities (see Pagodas) are magnificent, and highly ornamented with the most exquisite works in painting and sculpture; the rites of their worship are pompous and splendid, and the performance of them constitute an essential part of the more munificent transactions of common life; and the Brahmins themselves, who are the ministers of religion, and profuse in all its functions, are of an order elevated above all others, acknowledged to be sacred, and, by a gradation of rank among themselves, adapted to maintain subordination to each other and to their devotees, who have enriched their pagodas. The number of their deities, the attributes, and characters they ascribed to them, and the various rites by which they conducted their worship, are such as indicate their origin in the mythology of society, and such as are adapted, in their nature and design, to answer the purposes of their introduction and establishment.

The manners of the Indians, though distinguished, from the time when they became known to the people of the West, for midnights, feasts, in a remoter period, to have resembled those of other nations. Accordingly, several of their deities were fierce and awful in their nature, and were represented in their temples under the most terrible forms. The known influence of superstition shall be able to account for the establishment of a ritual of worship suited to the character of such deities, among a gentle people. Every act of religion, performed in honour of some of their gods, seems to have been presided by fear; and a variety of mortifications and penances was introduced among them, the recital of which is accompanied with horror. Although it is repugnant to the feelings of an Hindu to find the blood of any creature that has life, many different animals, not excepting the most useful, such as the horse and the cow, were offered up as victims upon the altars of some of their gods; and their pagodas were even polluted with human sacrifices, as well as the temples of the West. But religious institutions, and ceremonies of a less severe kind, were more adapted to the genius of a people, formed by the extreme facility of their mental and corporeal frame, to an immediate love of pleasure. Accordingly, there is no part of the earth, in which a connection between the gratification of sensual desires and the rites of public religion is displayed with more shameful indecency than in India. In every pagoda a band of women was set apart for the service of the idol honoured there, and devoted from their youth to a life of pleasure, for which the Brahmins prepared them by an education, which added to many elegant accomplishments to their natural charms, that what they gained by their proficiency often brought no inconsiderable accession to the revenue of the temple. It is the office of these women, in every service performed in the pagoda, and in every public procession, to dance before the idol, and to sing hymns in his praise; and it is difficult to say, whether they triumphed against decency by the gaiter which they exhibit, or by the verbs which they recite. The walls of the pagoda are covered with paintings in a style no less indelicate; and in the innermost recess of the temple is placed the "Lingam," an emblem of productive power, which it would be improper to explain.

If we advert to the theology of the Brahmins, we shall find, amid all their polytheism and superstitition, they acknowledge and reverence one Supreme Being, the creator of all things, and from whom all things proceed. "They all," says Abul Fazil (Ayeen Akbery, vol. iii. p. 37) "believe in the unity of the godhead; and although they hold images in high veneration, it is only because they represent existential beings, and prevent the thoughts of those who worship them from wandering." To the same purpose, the Pandits, who translated the "Code of Gentoo laws," declare, that "it was the Supreme Being, who by his power formed all creatures of the animal, vegetable, and material world, from the four elements of fire, water, air, and earth, to be an ornament to the magazine of creation; and whose comprehensive benevolence selected man, the centre of knowledge, to have dominion and authority over the reft; and having bestowed upon this favourite object judgment and understanding, gave him supremacy over the corners of the world." These refined sentiments the modern Brahmins derive from the writings of their ancient Pandits, to which they are also indebted for the wisdom which the most learned members of their order now possess. The most profound mysteries of the Hindu theology, which had been long carefully concealed by the art of the modern Brahmins from the body of the people, have been unveiled by the translations from the Sanscrit, or Shanscrit language lately published. The principal design of the Baghvat-Gecta, already cited, seems to have been to establish the doctrine of the unity of the godhead, and, from a just view of the divine nature, to deduce an idea of that kind of worship which will be most acceptable to a perfect being: and we find in this poem descriptions of the Supreme Being, equal in sublimity to any which we derive from the Greek philosophers. Dow, in his "Disertation," (p. 40) quotes a passage from one of the sacred books of the Hindoos, from which we may infer what were the general sentiments of the learned Brahmins concerning the divine nature and perfections: "As God is immortal, he is above all conception; as he is invisible, he can have no form; but from what we behold of his works, we may conclude, that he is eternal, omnipotent, knowing all things, and present everywhere." To men capable of forming such ideas of the deity, the public service in the pagodas must have appeared to be an idolatrous worship of images, by a superstitious multiplication of frivolous or immoral rites; and they must have perceived, that it was only by sanctity of heart, and purity of manners, men could hope to gain the approbation of a being perfect in goodhefs. This truth is sedulously inculcated in the "Mahabarat;" but, at the same time, with the prudent reserve and artful precautions natural to a Brahmin, ludicrous neither to offend his countrymen, nor to diminish the influence of his own order. We find, however, a very lamentable mixture of ignorance and error in all the theories of the Brahmins, in common with the fages of other countries, concerning the perfections and operations of the Supreme Being. As they held that the syllem of nature was not only originally arranged by the power and wisdom of God, but that every event which happened was brought about by his immediate interposition; and as they could not comprehend how a being could act in any place in which it was not present, they ascribed the deity to be a vivifying principle diffused through the whole creation, an universal soul that animated each part of it. Every intellectual nature, particularly the souls of men, they conceived to be portions separated from this great spirit, to which, after fulfilling their destiny on earth, and attaining a proper degree of purity, they would again be re-united. In order to efface the stains with which a soul, during its residence on earth, has been defiled, by the indulgence of sensual and corrupt appetites, they taught that it must pass, in a long succession of transmigrations, through the bodies of different animals, until, by what it suffers and what it learns in the various forms of its existence, it shall be so thoroughly refined from all pollution, as to be rendered meet for being absorbed into the divine essence, and returns like a drop into that unbounded
boundless ocean, from which it originally issued. These doctrines of the Bramins, concerning the deity, as the soul which pervades all nature, giving activity and vigour to every part of it, as well as the final union of all intelligent creatures to their pristine source, coincide with the tenets of the Stoical school. In the errors also of their theological speculations we may discover a great similarity. As it was maintained by many among the Greek and Roman philosophers, that the vulgar and unlearned had no right to truth, the Bramins of India adopted similar ideas, and they regulated their conduct in the same manner with respect to the great body of the people. To their order belonged the exclusive right of reading the sacred books, as well as of cultivating and teaching science; and therefore they had in their power most effectually to prevent all who were not members of the order from acquiring any information beyond what they were pleased to impart. Hence it happened, that, like many of the cities of Greece, the Bramins of India carried on, with studied artifice, a scheme of deceit, and, according to an emphatical expression of an inspired writer (Rom. i. 18.), they 

detained the truth in unrighteousness. Whilst they themselves knew and approved what was true, whilst they harboured in the soul of mankind to support and perpetuate what was false.

The Bramins of Hindoostan have a language peculiar to themselves, which they call Sanscrit of Shanscrit (which fee); and in this language they have ancient books written, as they allege, by their great prophet and founder Brahma; such as the 

Bheda, or Vedan, delivered, as they say, to their lawgiver, Brahma, by the Deity; the Shulter, or Shukth, which is their 

biblic; and Puram, or Purnam, a history which they deem 

sacred, and which they pretend to have been dictated by God himself, containing also the explanation of the flatter. For an account of these books, see each of these terms. These sacred books are kept in close custody by the Bramins; nor do they suffer their contents to be communicated to their own laity, much less to strangers. The flatter contains a summary of their moral and ceremonial laws, together with the distribution of mankind into tribes and castes, and an account of the rules of conduct appropriated to each. (See Shastar.) From this book, on the precepts of which the Bramins profess to found their practice, it appears, that their religion, and particularly the ceremonial part of it, consists in frequent ablutions in their rivers, and more especially in the Ganges, muttering over divers prayers under green trees, and in their temples, accompanied with proccedings, thinking of bells, offerings to images, incantations, and similar rites, the observance of fasts and festivals, pilgrimages, invocations of saints, and divers strange and unaccountable penances. From their Vedan they pretend to derive several privileges, peculiar to their own order; such as those of celebrating the feast called "Iagam," at which they kill animals, and eat flesh, and offer a beast for sacrifice, which they trample, in order to avoid shedding its blood; of teaching the Kutteries the manner of celebrating this feast; of reading the Vedan, and of teaching it to their own tribe, and that of the Kutteries; of demanding but not of giving alms; and of never being punished with death, even for the most enormous crimes. Their office is to teach others not only reading, writing, and arithmetic, but the principles of their religion. As a recompense for their time and labour, the kings, or rajahs, assign for their support the revenues of certain villages, and they also receive contributions from the inhabitants of the several countries in which they reside. They are also allowed to officiate as merchants, and to practice physic, but are strictly forbidden to employ themselves in tillage, or any handicraft trade; or to perform any

fertile office, even for the king. An offence of this kind would incur degradation and expulsion from their tribe; however, they are permitted to act as secretaries, ambassadours, or counsellors to their sovereigns, and, indeed, they almost wholly engross these honourable offices to themselves. The birth, baptism, and education of the Bramins are attended with circumstances and ceremonies peculiar to themselves. At their baptism, they are not only washed with water, but anointed with oil, which rites are accompanied with prayers and benedictions. At an early age, they are invested with a small cord, which is hung on the left shoulder, and descends low on the right side, and which they retain as an essential article of their attire. The Bramins never contract marriage out of their own tribe, and that they do at a very early period of life. On this occasion they receive a second little cord, resembling the first, and to this also they usually annex a third, which serves instead of an upper garment. When the Bramins arrive at maturity and more advanced age, they are allowed to take wives out of the other tribes; but they never marry their children to near relations, as incest is deemed by them one of the five mortal sins which is scarcely ever to be forgiven. Among the Bramins polygamy is indulged to great excess; and as an apology for it, they allege, that the Vedan has not forbidden it. For concubinage and adultery they have no punishment; but a Bramin who finds his wife to be unfaithful, confines her, and supplies her with food while she lives; and if he be much attached to her, he requires her to serve at a feast, to which he invites several of his tribe, and after the guests have received viands from her hand, she is regarded as an honest woman. Their diet, like that of the ancient Brachmans, is simple and temperate, and consists solely of rice, roots, fruits, and herbs, and their drink is water and milk. They never use any intoxicating liquor; for they abhor drunkenness, and reckon it among their mortal sins. Although the Bramins decline eating flesh, because they deem the slaughter of animals for this purpose to be a great sin; they are, however, charged with inconsistency by the Kutteries and Soudras, who eat fish and flesh, as they dilodge many fowls from their bodies by plucking up roots and plants, which, upon their system of transmigration, are endowed with souls as well as animals.

The Bramins, as we have already observed, are priests both secular and regular, and have amongst them an established hierarchy, composed of several orders, that are variously distinguished in the several provinces of Hindoostan. The learned Bramins constitute two classes; the first of which is called "Kuru," and belongs to the priesthood; the second, denominated "Satiavir," or "Shantiavit," comprehends the professors of the different systems of theology. Besides these two classes of learned Bramins, there are many others, not much inferior to them in wisdom and erudition, whose chief business is to instruct youth in those points which relate to the ceremonies used in public worship, and solemn festivals. The ministerial function of the Bramins consists in praying with the people, and reading their law. To them it also belongs to educate the young persons of the same tribe, who advance by various gradations to the priestly office. When they are set apart to this office, they are enjoined not to change their tribe; to observe all things contained in the law of the Bramins; and not to communicate the mysteries of their religion to any of a different persuasion.

The Bramins are divided into six sects; viz. Weilnonua, Sevia, or Aradhya, Smartu, Shaavakka, Palenda, and Chetkea, who are distinguished by certain differences in their tenets, and ceremonial practices. For a further account of
BRA

the doctrine, worship, character, customs, &c. of the Brahmins, we may refer to the La Porte Ouvr. of M. Rogier, chaplain to the Dutch factory at Poohean on the coast of Coromandel; the travels of Bernier and Sommerv; the Difficulties of Orme, Dow, sir William Jones, &c. &c.; the Code of Gentoo Laws; the Asiatic Researches; Robertson's Difficulties concerning India, &c. See also the articles above referred to, and also Belom, Hindoo, Hindostan, &c. in this dictionary.

Robert de Nobili, an Italian Jesuit, and one of the Indian missionaries, in the beginning of the seventeenth century, in order to secure favours to his mission, assumed the title and appearance of a Brahman, and at length persuaded the credulous people, that he was, in reality, a member of that venerable order. He forged a deed in the ancient Indian characters, showing that the Brahmins of Rome were older than those of India, and that the Jefuits of Rome defended in a direct line from the god Brahma. He farther declared on oath, that he derived his origin from this Indian deity. By this imposture he profited twelve hundred Brahmins, whose influence proved very favourable to his mission. After his death, the Portuguese Jesuits carried on the imposture with very considerable success. These millions, however, were supplicated and abandoned, in consequence of a papal mandate, issued out in the year 1744, by Benedict XIV. who declared his disapprobation of the articles that had been used in the conversion of the Indians. Mothere's Eccles. Hist. vol. iv. p. 211. &c. 8vo. edit.

BRACHMANUS, in Ancient Geography, a river of India, on the other side of the Ganges, between this river and Catabeda.

BRACHMEA, Cangy-Varan, a town of India, in the peninsula on this side of the Ganges, according to Ptolemy. It was situated in the interior of the country, at an equal distance from the eastern coast of the peninsula and the town called Arcatis, and occupied by the people denominated by Ptolemy "Brachmanii Magni."

BRACHODES, the name of a promontory in the Mediterranean, on the coast of Africa. Ptolemy. Strabo calls it "Ammonis promontorium," and Procopius "Caput Vada."

BRACHSEN, in Ichthyology. See Brama Cyprinus.

BRACHVOGEL, in Ornithology, the name given by Frisch to the frugelus arquata, or common curlew.

BRACHURI, in Zoology, a term applied by Dr. Hill to a genus of aminoacules of a roundish figure, with tails shorter than the body. The vermes of this description have undergone of late years much accurate investigation, especially by Müller, the result of which is, that the genus brachuri is exploded by modern writers on the animalcula infusoria.

BRACHYACANTHUS, in Entomology, an insect of the Ichneumon genus found in Europe. The colour is black; spots on the head and thorax; small line on the femur, and tip of the abdomen white; wing very short; shanks fuscous, whitish at the base. Linn. &c.

BRACHYACANTHUS, a species of Ichneumon, the colour of which is black; antennae fuscous; abdomen and legs yellow; wing very short, Linn. Inhabits Europe.

BRACHYCOLON, from βραχυς, short, and κολον, member, is when one member of a period is shorter than another.

In which sense, the word stands contradistinguished from ἥκτος, where the members are equal, or confimed of the fame number of syllables.

covnt, cylindrical, equal. Down plumeo.

Species, 1. B. repanda. Leaves ovate, repando-filiate. 2. B. roundifolia. Leaves nearly round, very entire. Forster.

BRACHYGLOTTIS. See Cineraria.

BRACHYGRAPHY, (from βραχυς, short, and γραφη, to write) denotes the art of short-hand writing, called also tachography. See Short-hand.

BRACHYLOGY, from βραχυς, short, and λεγη, expression, in Rhetoric, brevity, the expressing anything in the most concise manner. This, so far as consistent with perspicuity, is a virtue and beauty of style; but if obscurity be the consequence, which is often the case, it becomes a blemish and inexcurable defect. Quintilian gives us an instance of brachy
logy from Sallust: Mithridates, corpore ingenti periculo armatus: Mithridates, as he were armed with the help of his stature. Inf. Or. lib. viii. cap. iii.

BRACHYOTOS, in Ornithology, a species of Strix, or Owl, of the horned kind. It is specifically distinguished by having the horn-feather or tuft very short; the body is fuscous above; feathers edged with yellow; beneath pale yellow, longitudinally streaked. Forr. Penn. Donov. Brit. Birds. &c. Buffon calls this kind of owl l'oulonet, or grande chevêche. It is the short-eared owl of English ornithologists. The length is fourteen inches. Found in America as well as Europe.

BRACHYPNEA, in Medicine, a term expressing short breathing, a symptom which occurs in various affections of the lungs, both acute and chronic, from βραχυς, short, and πνευμα, to breathe. See Dyspnea.

BRACHYPOTE, a term applied to persons labouring under acute diseases, who drink but little, and with difficulty; from βραχυς, short, and ποτη, a drinker. This term has been applied by some modern physicians to persons labouring under hydrophobia.

BRACHYPTERA, in Entomology, a species of Mantis, found by Pallas in Russia. The colour is cinnereous; thorax dentated; wings half the length of the abdomen. Haunts sandy deserts.

BRACHYPTERA, in Ornithology, the name of a genus of birds of the rapacious kind, in Willughby's System. The birds of this genus he distinguishes by the shortness of the wings, the gola, the wing being derived from βραχυς, short, and πτερον, a wing; these, when folded, not reaching so far down as the extremity of the tail. Of this genus were the gobby, sparrow hawk, and three kinds of butcher-bird. Neither the generic term, nor the discriminating character laid down for it are recognised by modern ornithologists.

BRACHYPTERUS, in Entomology, a species of Cimex, defribred by Linnaeus, the colour of which is pale; body linear; wing-cases a third part the length of the abdomen. Inhabits Europe.

BRACHYPTERUS, a species of Gryllus, (Tettigonia, Fab. Locútia, Gmel.) Inhabits the north of Europe. This kind feeds upon the grass; it is of a greyish fuscous colour, and is distinguished further by having the wings, and wing-cases
scares half the length of the body, a circumstance to which its specific name alludes.

**BRACHYPYRENA.** from *brachy,* short, and *pyrex,* nucleus, in Natural History, a genus of fossils of the class *Septaria.* The brachypyrena have a short roundish nucleus, included by, and contained within, the body of the units.

**BRACHYTELOSTYLA.** the name of a genus of crytals.

The word is derived from *brachy,* short, and *tele,* far, and *ystyl,* a column, and expresses a perfect crytal, with a short intermediate column.

The bodies of this genus are crytals composed of a short rectangular column, terminated at each end by an hexagonal pyramid. Of this genus there are six known species. Hill's Hill. Fossils, p. 103.

**BRACHYURA.** in Entomology, a species of *Eqnkius,* that inhabits Italy. It is briefly described as being entirely yellowish.

This is the short-tailed sparrow, and short-tailed Italian sparrow of English writers. Britton names it *passerulus* bononiae.

**BRACHYURUS.** in Entomology, a species of *Ichnespidius,* that inhabits Germany. The colour is fulvous: feeted fulvous; thorax, eyes, and abdomen, (which is linear at the base,) black. Schrank.—Abdomen and head tealaceous; legs yellow.

**BRACHYURUS.** in Ornithology, a species of *Lanius,* described by Pallas. The head above is ferruginous grey; eyes-brows whitish; a black band from between the eyes to the ears; body above greyish, cincinnous; beneath yellowish white; tail rounded. This is the short-tailed *furry* of Latham. Found but rarely in Hungary.

**BRACHYURUS.** the short-tailed crow, a species of *Corvus,* of a green colour; beneath tawnyish, and lined on the head with the same colour; wings with a white spot.

This bird inhabits the islands of the Indian ocean. The species admits of no less than seven distinct varieties, according to some writers, of which number Gmelin describes three, *corvus* Philippinus, *corvus* Bengalensis, and *corvus* Moldogofaricns.

**BRACHIEUX.** in Geography, a town of France, in the department of the Loire and Cher, and chief place of a canton, in the district of Belize, 3 leagues N. E. of Belize. The place contains 790, and the canton 10,250 inhabitants; the extent of the territory comprehends 345 kilometres and 14 communes.

**BRACKE.** a town of Germany, in the circle of Westphalia, and county of Oldenburg; 18 miles N.N.E. of Oldenburg.

**BRACKE, or Brake.** a town of Germany, in the circle of Westphalia, and county of Lippe; one mile S. E. of Lemgow.

**BRACKENWITZ.** a town of Germany, in the circle of Upper Saxony, and middle mark of Brandenburg; 3 miles S. of Treuenbrieten.

**BRACKET.** in Building, denotes a kind of wooden stay, in form of a knee or shoulder, serving for the support of shelves, &c. or a cramping-iron, which serves as a stay in timber work. The word is also written *braget,* and seems derived from the Italian *brachetto,* a diminutive of *braccio.*

Madillons are a sort of *brackets,* to the corona of an entablature.

**Brackets.** in Artillery. See *Cheeks of a Mortar.*

**Brackets.** in Ship-building, small knees serving to support the galleries, and commonly ornamented with carving. Also, the timbers fixed under the galleries and frame of a ship's head to support the gratings.

**BRACKISH water,** a mixture of fresh and salt water.

**BRACKLEY,** in Geography, an ancient borough town of Northamptonshire, England, comitial of the two parishes of St. James's and St. Peter's, and a hamlet called Old Brackley. Leland states, that this place confounded of many streets, in his time, and that it was a flourishing town during part of the Saxon dynasty, till the Danes "raided it." Edward the 11th. made it a wool flane, and gave it a corporation; but it was not invested with borough privileges till the last parliament of Henry VIII., when two members were returned. "There was a fair cattle," says Leland, "in the south-west end; the site and hill where it stood is evidently seen, and beareth the name of the Castle Hill, but not any piece of wall standing." Here were also three ancient catholic crosses, one of which, says this respectable antiquary, "was decorated with divers tabernacles, with ladies and men armed. Some say the flapers of the town made it; but I rather think some nobleman, lord of the town." This crose, 28 feet high, was taken down in 1706, by the duke of Bridgewater, to build the handsome town-house in its place. Robert Beauf, earl of Leicester, founded an hospital here in the time of Henry III. John, son of lord chancellor Ellempere, was created viscount Brackley 14th James L., earl of Bridgewater the following year, and marquis, afterwards duke of Bridgewater, to George I. On Bayard's Green, between Brackley and Mitty, was held a famous tournament in 1249; and another was held here about the same time. The river Oufe rises near this town, and supplies it with water. Here are a weekly market on Wednesday, and five fairs annually. It is 13 miles from Northampton, and 6; N. W. from London. The two parishes and hamlet contain 183 houses, and 1495 inhabitants, of whom 253 are employed in manufactories. Gough's edition of Camden's Britannia; Bridge's history of Northamptonshire, &c.

**BRACKWAD, a town of Germany, in the circle of Westphalia, and county of Ravenburg; 4 miles S. E. of Bielefeld.

**BRACLAW, or Braklaw,** a city of Poland, and capital of a palatinate of the same name, called allo of Lwow, seated on the river Bag.

**BRACSEA,** a thin flake or spangle of any substance; it is used by many authors in the same sense with the word *lamina,* but usually in a sort of diminutive sense, expressing a small plate.

**BRACSEA, BracT, in Botany, a name given by the Latins to very thin plates of gold, silver, or other metal, and applied by Linnaeus to the floral leaves of a plant, first distinguished and described by himself. They consist of scales, or of small leaves, which differ from the other leaves of the plant generally in figure, and often in colour. They are placed sometimes on the peduncle, and always near the flower, so that in some cases they are liable to be mistaken for a perianth; they may, however, be distinguished from it by their continuing as long as the proper leaves, whereas the perianth withers as soon as the fruit becomes ripe. Good examples of bracteae may be found in *tilia* (linden or lime-tree), *malpuryum* (cow-wheat), *monarda* (ofewgo balm), &c.

According to the physiology of Linnaeus, and his immediate pupils, they are formed in the bud, by a kind of anticipation, and become proper leaves of the new shoot or branch in the second year, if the state of inflorescence be not hastened on by the force of the medullary principle; but when that takes place, as in certain circumstances it naturally does, part of the nourishment which they would otherwise have received, being diverted to the use of the fruiti-
fructification, they do not acquire their full vigour, and in consequence, dwindle into floral leaves. In proof of this theory, it is alleged, that if the fructification he prematurely delayed by injury, or purposely cut off, they regain sufficient influence, and assume the form and size of perfect leaves. See the introduction to the second volume of the Systema Naturae, and the two dissertations, entitled Protocols Plantarum, published in the Amoretium Academy.

The bracteae are placed by Linnaeus under the head of what he fancily calls frutes, props, or supports, from an idea that they sustain or strengthen the whole plant, or some of its parts. In the Syboma Nature they are distinguished according to their duration, into caducous, falling off before the end of the summer; deciduous, falling off at the end of the summer; and persistent, remaining beyond the end of the summer; but it does not appear how the exception laid down in the Philosophia Botanica, to discriminate a bract from a petiole, is to be applied to those that are caducous. They are fixed comose, when they shelter the flowers in the form of a crown, tuft, or coma (head of hair) as in the frutillaria imperialis (crown imperial), bromelia amans (pineapple), &c. but in this case they do not very happily correspond with the generic appellation fullum. They have the character of imbricate, when they are placed among the flowers so close to them and to one another, as to form a kind of spike or head, as in prunella (self heal), and orizymum (marjoram).

Bracteae not only afford excellent specific differences, but are sometimes admitted into the generic character, as in many genera of the natural order, umbellifer, and in some of the class dicotyledon, and are there laid by Linnaeus to constiute an involution, one of his species of calyx. They are however, truly bracteae; and would, doubtless, have been so considered by him, if, under that denomination, they had not interfered with the established principle, that generic characters are to be taken solely from the parts of fructification.

Bractea, in Entomology, a species of phalena of the noctida family, the wings of which are variegated, and in the middle of each of the anterior pair is a large shining golden spot. Fabr. &c. Found in England, though very rarely, more common in the south of Europe.

Bractearia, in Natural History, the name of a genus of sowths of the tribe Clas, the characters of which are, that they are composed of small plates in form of spangles, and each of these, naturally very thin or stifile, into very thin ones.

The word is derived from the Latin bracteae, a spangle or small and thin glittering particle of any thing.

There are many species of this genus denominated from the variety of their colours; as mica aurea, or gold-glimmer, and mica argentata, silver-glimmer, etc. &c.

Bracteata, in Entomology, a species of cicada (membracis, Fabr.) of a small size, that inhabits Cayenne, the thorax of which is green, and without spots.

Bracteated, among Antiquaries, denotes a coin covered over with a thin plate, or leaf of some richer metal. See Medal.

Bracteated coins, or medals, nummi bracteati, are usually made of iron, copper, or brass, plated over, and edged with gold or silver leaf, and then dipped with the hammer or milled. Medallists find some bracteated pieces even among the truly ancient coins. The French call them fourres.

Bracteatus, in Entomology, a species of monocus, the shell of which is orbicular and unarmed. Mill. The shell of this kind is very pellucid, antennae and legs furnished with bristles, eyes not conspicuous. Inhabit pure fresh water.

Bracton, Henry de, in Biography, a celebrated English lawyer and judge of the 15th century, was, according to Prince (Worthies of Devon), a native of Devonshire; and having gained distinguished reputation by his study of both the canon and civil law at Oxford, he was appointed by king Henry III. one of his judges itinerant about the year 1544, and afterwards, as some say, lord chief justice of England. In the exercise of this office he conducted himself with exemplary integrity; but his fame is principally owing to his excellent treatise on the laws of England, generally entitled De legibus et consuetudinibus Anglie, though he himself gave it the title of "Britto," whence many mistakes have occurred in writing his name. This work has always been esteemed one of the most accurate and methodical treatises on our laws. It was first printed at London, in 1563, in folio; and reprinted, in 1569, in 4to., from a collection of various manuscripts for the amendment of the text. Some inconsistencies have been charged on Bracton from the citation of different passages in his book; in some he seems to discover too great an attachment to the authority of the pope; and in others he gives such various representations of the regal authority in this kingdom, as seem to favour sometimes the extension, and at other times the restraint and limitation, of the royal prerogative. These inconsistencies, however, have been ascribed by candid writers to the unsettled times wherein he lived, in which the power of the king and that of the barons were alternately prevalent, and charters of liberty were no sooner signed than violated. The time of his death is not precisely ascertained; but he probably survived his master, and died in the reign of Edward I. Biog. Brit.

Brad, in Geography, a town and capital of a district of the same name, in the county of Wiltshire, in Transylvania.

Braddock's Field, a place in America, situate on Turtle creek, on the N. E. bank of Monongahela river, 6 miles E. S. E. from Pittsburg, and rendered memorable by the defeat of general Braddock, who with 1400 men, the first division of his army, fell into an ambuscade of 400 Indians, by whom he was defeated and mortally wounded, July 9th, 1755. The American militia, disadvisedly placed in the rear, continued unbroken, and served as a rear-guard; and under Col. Washington, afterwards president of the United States, preferred the regulars from being entirely cut off.

Braddock's boy lies on the south side of lake Ontario, 42 miles west from Great Sodus, and 65 east from fort Niagara.

Bradfield, a market town of England, in the county of Essex.

Bradford, John, in Biography, a protestant martyr, who flourished in the reign of queen Mary, was born at Manchester, in the early part of the reign of king Henry VIII. Having received a good education, not only in the Latin tongue, but particularly in writing and accounts, he was recommended to sir John Harrington, treasurer, pay-master of the forces, and principal engineer at Boulogne, and was employed by him as his clerk. In this employment, for which his education had eminently qualified him, he continued many years, approving himself to his principals, and deriving from his office considerable emolument as well as honour. In the discharge of his trust, however, he seems to have availed himself of his acuteness and dexterity, as an accountant, in a manner that rendered him uneasy in his own mind, more especially after he had heard a sermon from Latimer on the subject of "Restitution;" and he immediately determined to procure an adjustment of his accounts with the crown, and to apply to his master, sir
BRA

Sir John Harrington, for this purpose; for John demurred and delayed, and thought Bradford conscientiously precise and scrupulous. This incident gave a new direction to his views and pursuits; and though for some time he pursued the study of the law at the Inner Temple, he resolved to remove to Cambridge, and to devote himself to the profession of a divine. In this new situation he applied to his studies with singular diligence, and first took his degree of M.A.; and was afterwards elected fellow of Pembroke Hall. During this time the recollection of his former misconduct oppressed his spirits, nor was he able to recover the tranquillity of his mind till, by successive payments, as his circumstances would allow, he had discharged the full sum of 500l. as a repetition to the king. By this act of just retaliation, performed voluntarily on his own part before the king and council knew of the offence, did he give the most unequivocal proof of the sincerity of his repentance, and lay the firmest foundation of that reputation and usefulness for which he was afterwards distinguished. Having thus pacified the accusations of his conscience, he proceeded in his studies with unabated vigour; and his character for piety was likewise so eminent, that bishop Ridley, in 1550, sent for him to London, induced him to receive death's orders, gave him a licence to preach, and soon after appointed him one of his own chaplains. Mr. Bradford acquired great popularity as a preacher, both at St. Paul's Cross in London, and in his native county; and continued the exercise of his ministry with unintermitting ardour and singular succefs until the close of king Edward's reign, and after the commencement of that of queen Mary. But with the change that took place on this occasion, he, as well as many others, suffered the severity of persecution. His undaunted resolution and zeal exposed him to peculiar danger; and his popularity as a preacher, which afforded him an opportunity of preserving the life of a popish priest, who, by a furious declaration against the late king, and in favour of popery, had incensed the multitude that formed his auditory at St. Paul's Cross, was interpreted by his enemies into an occasion of offence; and in consequence of this act of humanity and kindness, for which he merited recompence even from the powers that then prevailed, he was arrested by order of the queen's council and bishops, and committed to prison under a charge of sedition and heresy. During his close confinement, for about a year and a half, in various prisons, he manifested an invincible attachment to the principles of the reformation; and exerted himself by private admonitions and epistolary addresses, for which he availed himself of every opportunity that occurred, in representing the delusions of popery, and in confirming those who were wavering in their adherence to the protestant faith. Many of his letters and discourses are extant; and they abound with expressions of the most fervent piety and unyielding constancy. In the beginning of the year 1554, he was brought before a commission specially appointed for his examination; but, as he persisted in an undaunted avowal of his opinion, he was finally condemned. After his condemnation, he was remanded to prison, where he remained near half a year longer; manfully refuting every attempt that was made with a view of inducing him to abandon the cause to which he was devoted, and recommending himself to mild treatment on the part of those who had the custody of him, by the gentleness of his temper and manners. During the successive intervals of his confinement, he preached constantly, and was allowed to receive the visits of his friends, who refrained in great numbers to enjoy the benefit of his discourses. So irreproachable and exemplary, indeed, was his conduct, and to such a degree did he attach the esteem, and interest the humanity of those who had access to him, that many papists were induced to express their wishes for the preservation of his life. To his fellow prisoners he communicated faithful counsel and pious addresses, from the several circumstances required; and he was eminently useful in reclaiming the erroneous, and in reforming the vicious and profane. At length, however, the day of his execution arrived; and when it was announced to him, he lifted up his eyes to heaven, and said, "I thank God for it; I have looked for it a long time; therefore it comes not suddenly, but as a thing waited for every day and hour; the Lord make me worthy of it." On the 11th of July, 1555, he was brought to the scaffold at Smithfield, in company with a Yorkshire youth, named John Lyefe, then an apprentice in London, whom he animated to constancy by his example of calm and undaunted fortitude; and having killed a faggot and the flake, he pulled off his cloaths, and prepared for the last tremendous scene. At the flake, he exclaimed aloud, with his hands and face lifted up towards heaven, "O England, England, repent thee of thy sins; beware of idolatry, beware of Antichrists, lest they deceive you," and then forgiving, and interceding for the souls of all the world, he comforted his companion, and embracing the flames reeds that were near him, uttered these words, the last which were distinctly heard: "Strait is the gate, and narrow is the path;" and thus expired. Biog. Brit.

BRADFORD, East and West, in Geography, townsip of America, in the county of Chelker, and state of Pennsylvania.

BRADFORD, a township of Essex county in the Massachusettts, been on the south side of Merrimack river, opposite to Haverhill, and 10 miles west of Newbury port. It has two parishes, and contains 1,571 inhabitants. In this place is a manufactory of leather shoes for exportation, and some vessels are built in the lower parish. Several streams fall into the Merrimack river from this town, which support a number of mills of various kinds. Also, a township in Hillsborough county, New-Hampshire, containing 2,179 inhabitants, incorporated in 1760; 20 miles E. of Charlestown. Also, a township in Orange county, Vermont, on the west bank of Connecticut river, about 20 miles above Dartmouth college, having 674 inhabitants. In this township is a remarkable ledge of rocks, about 200 feet high, which appears to threaten the passing traveller; the interval between it and the river is fearfully wide enough for a road.

BRADFORD, a market and manufacturing town in Wiltshire, in England, 100 miles W. from London, and 7 N. E. from Bath. Its name appears to have been derived from the Saxon term Bradenforde; so called from the broad ford which formerly crossed the river at this place. Though not a town of large extent, it has acquired considerable importance from the great quantities of fine broad cloth manufactured here, as from ten to twelve hundred pieces are sent away annually. One manufactory alone employs nearly fifteen hundred persons, and the number of clothiers is between sixty and seventy. Its situation is peculiarly romantic, being principally built on the declivity of a hill, and consists of three streets rising one above the other. These are narrow and irregular, yet many good houses present themselves to the eye of the passenger. The church, a plain stone building, with a square tower and small steeple, is situated at the foot of the hill, and consists of a nave, S. aisle, chancel, and a small chapel on the S. side. In the chancel are several large and handiome monuments, and the church is ornamented with two windows of modern stained glass, which were given by John Pellet, Esq., a native of Bradford; who also left a donation of ten pounds to be laid out in bread, and distributed among the poor monthly. Near the church is a free-school for boys, and in the town are two charitable
At Pulley, 4 miles from Bradford, is a large religious house, belonging to the Moravians; and consists of a chapel, refectory, dormitory, school, \\&c. See Moravians. Aikin's Description of the country round Manchester, 4th.

BRADING BAY, lies in the Isle of Wight, at the east end of the island, almost opposite to Portsmouth, and not far from St. Helen's road. It is generally dry at low-water, and when the tide is in, has only a narrow channel for small vessels, on account of a bar at the entrance.

Male Flowers.

Calyx none, (Schreb.) five or six leaves, perfoliâted, (Gartner.) Corol. petals five, ovate, concave, spreading, nearly equal. (Schreb.) none, (Gart.) Stæm. filaments three, very minute; anther cylindrical, erect, consisting of three united, didymous anthers, tipped with a sharp-pointed appendix. (Schreb.) fix. (Gart.)

Female Flowers.

Cal. none. Cor. one-petalled, fix-parted, inferior, three of the segments interior. (Schreb.) Cal. and Cor. as in the male. (Gart.) Pyl. germ globosum, fix-furrowed, superior; style none; stigmas, from fix to eight, very small, convolvulaceâs. (Schreb.) 'style thick, fix-parted above, stigmas simple, obulate. (Gart. from the papers of Salmon.) Pericarpium capellus depresso, with twelve furrows, fix cells, and fix valves, delicient. Seeds, solitary, roundish, (Schreb.) two in each cell, (Gart.)

Species 1. B. finnisca. (La Marck. illus. pl. 772. as branch in fruit,) a shrub. Leaves, alternate, lanceolate, veined. Flowers, axillary, single, pedunculated. 2. B. eclyptica. A shrub. Calyx, monophyllous, fix-parted. (Gart.) Flowers more than one on a peduncle. (La Marck.) 3. B. Glochidion. (Philippica, Cavanilles. pl. 374.) A tree. Leaves, alternate, lanceolate, smooth, axillary, very small and numerous.

Bradlesea is nearly allied to phyllanthus; but the structure of the seeds is singular, that it ought to be made a distinct genus.

BRADLEY, JAMES, in Biography, an eminent astronomer, was born at Shireburn, in Gloucestershire, in the year 1692, and received the first rudiments of education at a grammar school in North-Leach. He was admitted a commoner of Balliol college, in the University of Oxford, March the 15th, 1716-17; and took the degree of B. A. October the 24th, 1714, and that of M. A. January the 21st, 1716-17. In 1719, he was ordained deacon and priest; and preferred in the same year by the bishop of Hereford, who had made him his chaplain, to the vicarage of Bridgwater in Herefordshire. The sinecure rectory of Landewy Welfry in Pembrokeshire was also procured for him soon after, by the honourable Mr. Molynueux. With such patronage he might have indulged reasonable expectations of more considerable preferments, and of attaining to eminence in the church; but his predilection for mathematical and astronomical studies gave a different direction to his views and pursuits. In these he was assiduous and encouraged by his uncle, Dr. James Pound, who then resided at Wansley in Essex, where our astronomer was curate, and where he commenced those observations that laid the foundation of his future fame.

On the 31st of October, 1721, he succeeded Dr. John Keil, as Savilian professor of astronomy at Oxford; and determining to devote himself to astronomy, so congenial to
his taste and talents, he refin'd his preferments in the
church. In 1734, he communicated to the Royal Society
his observations on a comet, which had appeared towards
the close of the preceding year; and, in 1726, he communica-
ted to the same body, of which he had become a mem-
er, a paper containing a comparison of some observations
made at Lisbon, with those made by himself at Wanstead,
on the eclipses of the first satellite of Jupiter, and published
in the Philosophical Transactions, No. 396. (See Abr.
vol. vii. pt. i. p. 412.) These communications were follow-
ed by his celebrated theory of the aberration of the fixed
stars, the discovery of which was announced in 1729, and
published in the Philosophical Transactions, No. 406. (See
Abr. vol. vii. pt. i. p. 129.) For a particular account and
illustration of this theory, of the principles on which it is
founded, and of the important purposes to which it is
applicable, see the articles Aberration, Light, and Star.

Our author's theory, established by the most accurate ob-
servations, was approved by the most eminent mathematicians;
and whilst the publication of it served in a very high
degree to advance his reputation, it was the means of intro-
ducing him to the acquaintance and friendship of the earl
of Macclesfield, sir Isaac Newton, Dr. Halley, and several
other person of the most distinguished character.

In 1730 Mr. Bradley was appointed lecturer of astronomy
and experimental philosophy in the University of Oxford:
the duties of which office he performed till within a few
years of his death. His observations on the comet that
appeared in the beginning of the year 1737, were published
in the Philosophical Transactions, No. 446, and an abstract
About this time Dr. Halley, who was then the astronomer
royal, and who had conceived a very high opinion of Mr.
Bradley's talents and attainments, formed a design of refi-
ing in his favour; but his death prevented the accomplish-
mint of his purpose. However, after that event, he obtained
the appointment in February 1741-2; and was, at the same time,
honoured with the degree of doctor of divinity by a diploma
from Oxford. He was now in a situation peculiarly favourable
for the prosecution of his favourite science; and he had no
opportunity of cultivating it by the number and accuracy
of his observations. Accordingly, in 1747, he announced
to the Royal Society his important discovery of the mo-
tion of the earth's axis; which was published in the Philo-
sophical Transactions, No. 485; and is preferred in the
Abridgment, vol. x. pt. i. p. 32. For a particular account
of this discovery, see Note. The Royal Society,
duly apprized of its value, conferred on Dr. Bradley their
annual prize medal. By means of the excellent instruments,
constructed by Mr. George Graham, Dr. Bradley, who knew how to use them, and what allowance ought to be
made for the errors to which they were subject, was enabled
to observe celestial phenomena, which had escaped the notice
of former astronomers; and to the vigilance and accuracy
of his observations we are indebted for the above-mentioned
discovery. Sensible, however, of the importance and utility
of good instruments, our excellent astronomer availed himself
of the yearly visit of the Royal Society to the Royal Ob-
servatory at Greenwich, to recommend an attention to this
business; and he succeeded in obtaining, by the interpo-
sition of the society, in 1748, a grant of 1000l. from
his majesty George II. to be laid out under his direc-
tion for the improvement of the astronomical apparatus.
Mr. Graham and Mr. John Bird assisted him in the accom-
plishment of this object. To him the world is peculiarly in-
debt'd for the new naval quadrant, as well as for those other
instruments which were set up in the Royal Observatory.

What use he made of them will further appear in the sequel
of this article.

In 1748, Dr. Bradley was chosen a foreign member of
the Royal Academy of Sciences at Paris; and about the
same time he became entitled to bishop Crew's beneficentio
of 50l. a year to the lecturer in experimental philosophy
at Oxford. In the year 1751, on occasion of a vacancy in
the valuable living of Greenwich, it was thought to be
conveniently situated for the Royal Observatory, and offered,
upon the part of the king, to Dr. Bradley. But he alleged
that the duty of a tutor was incompatible with his other
studies, and necessary engagements; and from the most con-
firmatory and laudable motives declined accepting this val-
able preferment. The king, however, determining that
he should not lose by his integrity, granted him a yearly
allowance of 250l. (Feb. 15, 1752); which was continued till his
death by his present majesty, and has since been regularly
paid to the astronomer royal.

In 1753, Dr. Bradley was elected one of the council of
the Royal Society; in 1754, he was appointed a member of
the Academy of Sciences at Peterburg, by diploma from
the whole body; and in 1757, he was admitted into the
Academy of Sciences at Bologna; and he was also a
member of the Prussian Academy of Sciences and Belles
Lettres at Berlin. His observations on the comet of 1757,
were published in the Philosophical Transactions, vol. i.
part 1. p. 498.

Dr. Bradley professed his studies and observations with
unabated vigour and industry, till within about two years of
his death; when, probably, as the effect of his intense and
little varied application, his spirits began to be depressed,
and he was disquieted by an apprehension that he should
survive his rational faculties: a calamity, however, which he
never experienced. Nevertheless, in 1760, his bodily strength
decreased; and about the end of June, 1762, he was attacked
with a total suppression of urine, in consequence of an inflam-
mation of the kidneys, which terminated his life, at Chal-
ford in Gloucestershire, on the 13th of July, in the 70th
year of his age. He was interred at Mitchin Hamiton,
in that county, in the same grave with his mother, and his
wife, whom he married in 1744, and by whom he had one
dughter, who survived him.

"The public character of Dr. Bradley," says one of his
biographers, "as a man of science and discernment, is well
established by his works. His private character was in
every respect estimable. Temperate in his enjoyments,
mild and benevolent in his disposition, indifferent to
the calls of wealth, distinction, and even of fame; he was indebted
to his uncommon merit alone for the friendship and regard
of the most eminent men of his time. His manner was
engaging and communicative, and his language in conver-
sation clear, impressive, and fluent, though he was rather
dispofed to listen than to speak. That he published
with a keen spirit to his ferocious accuracy which rendered him deficient, or more probably to the calm
and placid temper of his mind, which did not strongly urge
him to solicit that attention he could at pleasure command.
"His observations made at the Royal Observatory during 20
years, comprised in 13 fol. and two quarto volumes, unfor-
unately for the interests of science, were taken away at his
death by his representatives, who, upon preparations being
made by government for recovering them by process of
law, (and an actual commencement of a suit for that pur-
pose,) presented them to lord North, by whom they were
transferred, in 1776, to the University of Oxford, of which
he was chancellor, on condition of their printing and pub-
lishing them. In June, 1791, fifteen years after the Obser-

vations
vations had been given to the university on this condition, and nearly thirty years after the death of Dr. Bradley, the Board of Longitude, fearing no prophet of their being published, passed several spirited resolutions, respecting the public right to their Observations, and the importance of the publication of them, which were transmitted to the vice-chancellor of the university; after considerate delay, in March, 1792, the Board was informed that the delegates of the prize in the university were proceeding with the work. About the same time in the following year the Board renewed its application to professor Hornby, under whose direction the Observations were to be published; and in reply, engaged that the first volume should appear on or before March 1794, in the following year. At length, however, after long delay and renewed application, and successive interruptions occasioned by the ill health of Dr. Hornby, the first volume was published in 1798, in a splendid form, more worthy indeed the magnificence of a great university, than suitable to the use of the practical astronomer; under the title of "Astronomical Observations made at the Royal Observatory at Greenwich, from the year 1750, to the year 1762," folio: the price in sheets being fifty guineas. Dr. Hornby, after having waited in a precise the causes of the delay attending the publication, proceeds to give some account of the instruments used by Dr. Bradley. The tables contained in this volume are "Observed transits of the fixed stars;" "Meridian distances of the fixed stars;" "Meridian distances of the fixed stars from the zenith, northward;" "Meridian distances of the fixed stars from the zenith, southward;" "With zenith fector;" and likewise "Apparent right ascensions;" the whole comprising 757 pages. Biog. Brit. Gen. Biog. Proceedings of the Board of Longitude in regard to the recovery of the late Dr. Bradley's Observations, &c. 1795, folio.

BRADLEY, Richard, professor of botany, in the university of Cambridge, fellow of the Royal Society of London, and foreign associate of the Academy of Sciences at Paris. He appears to have been indefatigable in his researches, and to have bestowed no less ingenuity than zeal for the promotion of his favourite study; yet no memoirs have been published of his life, and we only know the time in which he lived from the date of his several publications. "Historia plantarum fucculentarum," published in five parts, in 1716, 1717, 1725, 1727, and 1728, 4to.; they were afterwards published together in 1734, with figures. "A new improvement of planting and gardening, both philosophical and practical," first also in parts; and then collectively, in 1733, 8vo. In this he gives the anatomy of plants, and their sexes. He demonstrates the circulation of the sap, from the progress of a disease of the branch, downward to the root. He also brings, as a further proof, an experiment on the lime-tree, which being planted inverted, with the branches downward, produced leaves and flowers from the roots. "The virtues and use of coffee, with regard to the plague and contagious diseases," 1724, 8vo. with an engraved figure of the plant. "Philosophical account of the works of nature." He here also contends for the double sexes in plants. He gives an historical account of the principal gardens in Europe, and gives the preference to the public garden at Amsterdam. "New experiments relative to the generation of plants," 1724, 8vo. "Tentative concerning the nature of following ground, raising of grass beds, and training of line and hemp," 1724, 4to. "Survey of ancient horticulture and gardening, collected from the Greeks and Romans," 1725, 8vo. with many other similar works; also "Dictionarium botanicum," 8vo. 1728. in which he gives the medical properties and the countries from which the plants were originally brought. See Haller Bib. Botan. for a complete catalogue and account of his works.

BRADNINCH, in Geography, an ancient corporate and market town in Devonshire, England, is situated on the banks of the river Colnmb, in the great road from Exeter to Bath, 8 miles from the former, 2 from Collampton, and 163 W. from London. This barony belonged, in the time of Edward the Confessor, to Brickwood, a Saxon: and at present it is vested in his royal highness the prince of Wales. Bradninch sent members to a parliament holden at Westminster, the sixth year of Edward II., and likewise to another at Windor in the following reign; but on account of the trouble and expence, the members were excused from further attendance.

The original charter of incorporation was granted by Reginald, earl of Cornwall, (natural son of King Henry I.), who gave his seal to be used by them, which is still continued; the corporation consists of a mayor, recorder, twelve masons, a town-clerk, and twelve ferenets at mace.

The town consists principally of one irregular street, nearly a mile in length; the houses, in general, indifferently built, and covered with thatch, are estimated at 253, and the inhabitants 1157, who are nearly equally employed in agriculture and manufactures; of the latter, paper-making is the chief; there being within two miles of the town, five mills constantly at work.

Here are a market on Thursdays, and two fairs. The church dedicated to St. Denis, is an ancient edifice; the body and fourth aisle appear to have been built in the end of Edward III.'s reign, or early in that of Richard II. On the breaking out of a rebellion in the north of England, in the 28th year of Henry VIII., this town was appointed the head-quarters for the troops under the command of the marquis of Exeter, who was employed to act against the rebels.

BRADS, in Carpentry, a slender kind of nail, used in building, having no spreading heads as other nails have.

Of these, some are called "joiners' nails," and are for hard wainscots; others, "batten-rams," for soft wainscots; and some "bill-rams," or "quarter-heads," used when a floor is laid in halfe, or for shallow joints subject to warp.

BRADSBERG Lush, or jef, in Geography, a district of Norway, in the diocese of Chriftiania, containing the district of Tillemarken. The inhabitants are distinguished for their hardinesses and valour, and have been always accounted the most warlike people of Norway. In this district are several iron furnaces.

BRADWORTHIE, Thomas, in Biography, designated the "profound doctor," was born at Hatfield, in Suffolk, (according to Godwin), or at Harfield, in Suffex, (according to Bale), towards the beginning of the 14th century, and educated at Merton college, in the university of Oxford, of which he was proctor, in 1325, and where he took the degree of doctor in divinity. He was introduced to court under the patronage of Stratford, archbishop of Canterbury, and became confessor to Edward III. canon of Lincoln, and chancellor of St. Paul's cathedral in London. He accompanied the king in his warlike expeditions to France, and to his sanctity and prayers the supernatural of the aged abed the victories of this monarch more than to the bravery of the soldiers, or the skill of their general. In 1348, he was elected by the chapter of Canterbury, to succeed Stratford as metropolitan; but, in deference to the king and pope, who preferred John Ulford, he surrendered to him the archiepiscopal chair, but upon his death he was again
again elected, and confirmed by the king and pope. His consecration took place at Avignon, but his premature death prevented his being enthroned. As a theologian, and also as a mathematician and philosopher, he gained great reputation, and his character for an attention to the duties of his elevated station is highly commended. His works are lectures delivered at Merton college, and entitled "De caetu Dei, et de veritate caelestis contra Pelagium," libri ii. published by Henry Savile, in London, in 1613, fol.; "Geometria Speculativa," and "Arithmetica Speculativa," printed together at Paris, in 1513; and "Tractatus Proportionum," Venct., 1552. Moheim, probably referring to the first of the works above recited, says, "the learned Bradwardine, an English divine, advanced many pertinent and ingenious things towards the confirmation of Christianity, in a book upon Providence." Cave, Hist. Lit. t. ii. p. 429.

BRADY, ROBERT, a learned English historian and physician, was a native of Norfolk, and admitted, in 1643, to Corpus college, at Cambridge, where he took his degree of bachelor of physic, in 1673, and that of doctor in the same faculty, by royal mandate, in 1686. By the same mandate he was also elected master of his college. About the year 1670 he was appointed keeper of the records in the Tower of London, and some time after he was chosen regius professor of physic, in the University of Cambridge. A letter to Dr. Sydenham, written in 1679, and propounding certain questions, which were answered in Sydenham's "Epistle remonstrance due," is his only performance in the line of his profession. His practice was probably inconsiderable, as he employed himself chiefly in historical investigation, and was one of the representatives for the University, in the Oxford parliament of 1681, and in that of James II. in 1685. He was, however, physician in ordinary to the king. He, among others, attested the birth of the prince of Wales in 1688. He died in 1700. His principal historical works are, "An introduction to the old English history," and "A complete history of England, from the first entrance of the Romans unto the end of the reign of king Richard II." in 3 vols. fol. The first work was printed in one volume in 1684, and the sublitude of it may be comprised in the three following propositions, viz. 1. That the representatives of the commons in parliament were not introduced till the 40th of Henry III. 2. That William duke of Normandy made an absolute conquest of the nation. 3. That the succession to the crown of England is hereditary, and not elective. The second work was printed in two volumes; the first in 1685, and the second in 1700. The principal aim of Mr. Brady is to shew, that all the English liberties are derived from the crown by way of concession from the princes; and he addsuces a collection of copious materials, chiefly epitomised from Matthew Paris, in order to prove that the Normans imposed on the English nation their own system of laws and customs. The system adopted by Brady, in consequence of some hints resulting from his obligations to the crown, and his personal attachments, and ably supported, is the basis of the general doctrine maintained in Hume's history. To this purpose it is observed by the learned Dr. Gilbert Stuart, (View of Society in Europe, p. 327) that "Mr. Hume, truck with the talents of Dr. Brady, deceived by his ability, disposed to pay adulation to government, and willing to profit by a syslem formed with art, and ready for adoption, has executed his history upon the tenets of this writer. Yet, of Dr. Brady it ought to be remembered, that he was the slave of a passion, and that he meanly prostituted an excellent understanding, and admirable quickness, to vindicate tyranny, and to destroy the rights of his nation." besides his three volumes of history, Dr. Brady also wrote, "A treatise on Burghs," in a thin folio. Biog. Brit.

BRADY, NICOLAS, an episcopal divine, was licentually defended from Hugh Brady, the first Protestant bishop of Meath in Ireland, and born at Bandon in the county of Cork, in 1659. At the age of 12 years he was removed from Ireland to Westminster school, and from thence elected student of Christchurch at Oxford. After remaining in the University about four years, he went to Dublin, where his father resided; and in the University of that city he obtained the degrees of B. A. and M. A. and, afterwards, in a manner peculiarly honourable, he received the degree of D. D. His first ecclesiastical preferment was to a prebend in the cathedral of St. Barry, at Cork, and to the parish of Kinglashley, in the county of Cork, to which he was collated by bishop Wettenhall, to whom he was domelc chaplin. His attachment to the revolution, and his zeal in promoting it, exposed him to much suffering; and, such was his interest with Mr. Carty, king James's general, that in 1690, when the troubles broke out in Ireland, he thrice prevented the burning of his native town. Having been deputed by the people of Bandon to come over to England, for the purpose of petitioning parliament for a redress of some grievances which they had suffered, while king James was in Ireland, he resigned his Irish preferments, and settled in London. In this country he was much esteemed for his pulpit talents, and obtained several preferments, amounting in the whole to 600l. per annum; the lasts of which was the rectory of Clapham in Surrey, which he held, together with Richmond, to the time of his death. He was also chaplin to their majesties, king William and queen Mary, and afterwards to queen Anne. He died May 20, 1726, in the 67th year of his age. His works are a translation of the "Anecdotes of Virgil," published by subscription in 4 vols. 8vo.; "Three volumes of sermons, published by himself; and "Three other volumes," published by his son, in 1730; and "A new version of the psalms," in which he was assisted by Mr. Tate. This version was licensed in 1666; and is now used in most churches of England and Ireland, instead of the old and obsolete version by Thomas Sternhold and John Hopkins, made in the reign of king Edward VI. Biog. Brit.

BRADYPE, in Zoology, (in French) synonymous with Bradypus, the sloth.

BRADYPEPSIA, in Medicine, a term signifying slow digestion, from Bradys, sloth, and παίξις, concision. See Dyspepsia.

BRADYPUS, in Zoology, the first genus of animals in the order brutes, the character of which stands thus in Gmelin: no fore-teeth; grinders in each jaw fix, obliquely truncated, cylindrical, the two anterior ones longest, and far distant: body covered with hair. The species are tridactylus and didactylus, which see. Dr. Shaw defines the general character of the sloth, or bradypus genus, in a manner somewhat different from the preceding. He observes that there are no cutting-teeth in either jaw; that the canine teeth are obsolete, single, longer than the grinders, and placed opposite; grinders, five on each side, which are obsolete; fore-legs much longer than the hind; and the claws very long. The two species tridactylus and didactylus are obtained by this writer, under their old Linnaean names; a third species is also added, the urine sloth, bradypus urinatis, the uniform sloth of Pennant, and petre sloth of Cattan.

It should be observed, that the immense fossil skeleton, of which Mont. Cuvier has given an accurate description under the name of megalætherium, in the opinion of that writer, must have belonged to an animal much more nearly allied to the genus
BRA

genera bradypus, orloth, than to any other at present known. The skeleton of a whale was found in the vicinity of the river It is Plata in it, a helmeted cet beneath the surface of a family hall. It is 24 French feet long, and six in height. The original is at Madrid.

BRAE-MAR, in Geography, a mountainous district of Scotland, in Aberdeenshire, 7; miles N. W. from Aberdeen. In this territory the last Earl of Mar began to raise a rebellion in 1715.

BRAEG, a name given to a game at cards, from the nature of it; the principal stake being won by him who has the best hand, or who challenges the other gamblers to produce cards equal to his. In this game a pair of ace is the best hand, a pair of kings the next, and to this; and a pair of any sort wins the stake from the most valuable single card. The kneve of clubs pairs with any other card in hand; but a hand of cards of less value in this game has sometimes gained the stake from one of superior value, by the confidence and art of bragging: the contest being given up on the part of the latter through fear of losing. One stake is gained by the highest card that is turned up in dealing, three cards being dealt round to each player, and the last turn made; the highest card is the ace of diamonds: the other stake is won by the person who first makes up the cards in his hands one and thirty; each distinguished card palling for ten, and drawing from the pack. Each gambler deposits three stakes, one for each card.

BRAGA, in Geography, the Bracara of Antonius's itinerary, a city of Portugal, and capital of the province of Entre-Douro-e-Minho, is situated in a broad open vale, cultivated and shaded by trees, near the small river Cabeço. It is subject to the archbishop of the place, who has a revenue of above 100,000 escudos, and appoints judges and two tribunals, the one spiritual and the other temporal; so that this is the only city where the king does not appoint a corregidor, or a juiz de fora. In the courts, or privileged places round the town, his sentence is final in criminal affairs, but not on the inhabitants of the town. Braga contains about 13,000 inhabitants, 5 parishes, and 7 monasteries. Several of the streets are wide and open, but most of the houses are small. Among the objects of curiosity in this town, we may reckon the large old Gothic cathedral, with its antiquities and treasures; and also the church and monastery of São Fructuoso, with its treasures and relics, and standing very commodiously on a hill without the town. Braga claims a very ancient origin. The Romans called it Augusta Bracara, and Roman coins are often found in the neighbourhood. Although it has much declined from its former importance, it has a hat-manufactory, which supplies a large part of Portugal with hats for the common people; and it has an admirable manufacture of knives. It exhibits signs of industry and activity; and the women are everywhere seen knitting, weaving, or making linen. The rich inhabitants are reckoned very wealthy and unfeeling toward their neighbours in the other towns of Minho; and they are accused of being quarrelsome, fond of scandal, and of disgraceful manners. N. lat. 41° 25'. W. long. 8° 15'.

Braga, Ha, is now called Fort Dauphin, in the island of Cuba.

Braga, the name of a liquor brewed in Ruffia from wheat, which, as well as the beere, that is brewed only from malt, is turbid, foaming, affecting the head, and drunk by the common people. On the Terek, a sort of beer is brewed, called "terilatia braga," by foaming milk in warm water; and when it is found like milk, it is boiled, boiled soft, and so poured upon melted-ice and barley. By the malt the beverage is sweet, and in this flat oasts are added; it is then left to ferment, and the huks of the fluid driven from the drink, it is fit for use. It is of good colour, always turbid, rather clammy, distasteful to the palate, and very intoxicating.

Gen.Ch. Colfx none. Corol. one-petalled; tube globular, with ten stamens; border divided into three, equal, obtuse, recurved segments. Stem anthers fix, fiddle, oblong, adhering to the middle of the tube. Pfr. style thick; stigma concave; germ linear, inferior. Perianth long, quadraangular, four-celled, four-valved. Seeds, many.

There is only one known species, a shrub about five feet high. Leaves large, alternate, lanceolate, very entire, veined. Flowers in racemes, axillary, brown red. It grows on the mountains of Cochinchina.

BRAGANZA, in Geography, a city of Portugal, and capital of a dukedom of the same name, in the province of Tras-l-os-Montes, seated on a spacious plain near the river Ferreira. It consists of a city, fortified with towers and a castle; and a town, defended by a fort. Braganza contains two parish churches, two hospitals, four convents, and about 2700 inhabitants. It is one of the most ancient towns in the kingdom, and is said to have been built by Augustus. Its manufactures consist of silk flutes, velvets, and programs. It was erected into a dukedom by Alphonso V. in 1542. John II. its eighth duke, was crowned king of Portugal by the name and style of John IV.; and it confers the title of the present reigning family. N. lat. 41° 57'. W. long. 5° 45'.

BRAGANZA, a small town on the frontiers of the March of Trevianno, in the territory of the republic of Venise.

BRAGOT, derived from the old British word brag, which signifies male, and gots, a banchoor, a sort of drink made in some parts of England, of malt, with honey, spices, and other ingredients.

BRAGA, or Bregnetz, in Geography, a town of Norway, in a district of the same name, in the diocese of Christiana, seated on the side of the river Dramme, opposite to Storosmo and Tanger. These three towns lie in a fertile vale, at small distances from each other, at the bottom of some rugged rocks, and on the margin of a bay. They are distinguished by the general name of Dramme, because they are situated on that river. Each of them has its own church, and separate jurisdiction. The inhabitants are industrious, and carry on a considerable trade. The principal exports are timber and planks. The imports are chiefly corn, and led from England for smelting the silver ore at Kongberg. In the district of Bragnas-lehni there are several iron-works, and also a gruis-house. N. lat. 59° 45'. E. long. 10° 25'.

BRAGOS, a river of Spain, in Catalonia, which runs into the Segre, 6 leagues N. W. of Balaguer.

BRAGU POINT, lies at the mouth of the great river Awa (see Awa); and is supposed by M. Godfren (Geography of the Greeks and Latins) to be the "Magnus Promontorium," which M. d'Anville concludes to be cape Roman, at the extremity of the peninsula of Malaccas.

BRAGUZ, a town of Germany, in the county of Tyrol; 127 miles W. of Trent.

BRAHE, Tycho, in Biography, a celebrated astronomer, was the descendant of a noble family of Sweden, settled in Denmark, and born December the 16th, 1546, at Knudshof, a small lordship near Holmiborg in Scania or Schonen. His father;
father, Otto Brahe, having a large family, the charge of his education was undertaken by his uncle, George Brahe, who adopted him as his heir. This was a fortunate circumstance for Tycho, as his father thought literature inglorious, and wished all his sons to follow the military profession. After a course of private instruction in the Latin language, his uncle sent him, in 1559, to study philosophy and rhetoric at the academy of Copenhagen; where he was casually invited to the study of astronomy by an eclipse of the sun, which happened August 22nd 1560, at the precise time predicted by astronomers. Hence he was led to regard that science as divine, which accurately described the motions of the celestial bodies, and predetermined their relative positions. From this time he devoted himself to the study of astronomy, and by means of the tables of Stadius, which he purchased, he acquired a knowledge of the theory of the planets. In 1562, he was sent to study the civil law at Leipzig, in which he made a very considerable proficiency; but, in withdrawing the remonstrances of his tutor, and the application with which he was required to prosecute the study of the law, his predominant inclination led him to perfect himself in astronomy. With this view he expended the money that was allowed him for his private expenses, in the purchase of books, the difficult passages of which were explained to him by his private tutor Scultens; and by means of a small celestial globe, and nightly observations of the heavens while his preceptor was in bed, he became acquainted, in the course of a month, with the names and positions of the constellations, and the apparent motions of the celestial bodies. Inspired with the same ardent zeal in the prosecution of his favourite science, he acquired a competent knowledge of mathematics, without the assistance of a master, and invented several mathematical instruments. Having passed three years at Leipzig, it was his intention to have pursued his travels through Germany; but the death of his uncle in 1565, and the estate which was bequeathed him, required his return to his native country. Disheartened, however, in his favourite pursuits by his relations, he made the necessary arrangements of his affairs; and before the expiration of a year, he abandoned his country, and set out on his travels. Accordingly he first went to Wittenberg, and on occasion of the plague, which broke out in this town, he removed, in 1567, to Rostock, where an accident occurred that endangered his life. At a wedding-feast to which he was invited, a dispute arose between him and a Danish nobleman, on some subject of mathematics, which terminated in a duel; and having lost his nose in the conflict, he continued to supply the defect completely, by an artificial composition of gold, silver, and wax, that it could hardly be distinguished from the natural organ. From Rostock, Tycho continued his travels through the principal towns of Germany and Italy, and in 1569 he repaired to Augsburg, where he formed an acquaintance with the celebrated Peter Ramus, who admired his skill in the science of astronomy. After his return to Copenhagen, in 1574, he was favoured by his maternal uncle, Sten Bille, with a convenient retreat from the ceremonies of the court, and the intrinsic value of the capital, at his castle of Heritzvold near Kandtorp; which also afforded him a commodious situation for the construction of an astronomical observatory, and a chemical laboratory. During his residence with his uncle, Tycho, besides his astronomical researches, prosecuted, with his natural ardour, the study of chemistry, or rather of alchemy, to which he seems to have had an early inclination, with the chimerical view of obtaining the philosopher's stone, that he might amass wealth sufficient to enable him to settle in some foreign country. At Heritzvold he observed, in 1572, a new star in the constellation Cassiopeia. Soon after this period he incurred the resentment of his relations, by marrying a beautiful country girl, whose name was Christiana, and who was the daughter of a neighbouring peasant. Although he offered various reasons in justification of his choice, the connection with a person so far below his rank alienated his family from him; and they refused to hold any intercourse with, until Frederic II., interposed, and authoritatively effected a reconciliation. Tycho himself seems not to have repented of his choice; but found in his Christiana, to whom affection had attached him, a grateful companion, and an obedient wife. In 1574, he commenced his lectures at Copenhagen, by the express desire of the King; and in these lectures he took occasion to explain the theory of the planets, introducing his explanation by a learned oration on the history and excellency of astronomy, and the litter-ladies, with some remarks in favour of judicial astrology, a study no less congenial to the times than to the inclinations of Tycho himself. Disgusted by the conduct of his relations, and with his countrymen in general, our philosopher determined to quit Denmark and settle abroad. After travelling through Germany and Italy, he at length formed a purpose of fixing his residence at Bafle, to which he was induced by the fertility of the soil, the cheapness of living, the celebrity of the university, and the opportunity this situation would afford him of maintaining a correspondence with the astronomers of France, Germany, and Italy. With this view he returned to Denmark; but whilst he was preparing for his removal, he received an unexpected message from the King. Frederic, secretly apprised of his intentions, was unwilling that Denmark should be deprived of so great an ornament; and in order to retain him in his dominions, offered him protection, and, with a liberality which did honour to the monarch as well as to the philosopher, presented him with the island of Hven, and promised to erect the buildings and to provide the apparatus necessary for his scientific pursuits. He also settled on him a pension of 2000 crowns a year, and gave him a fee in Norway, and a canonry of Rosendal, which produced a thousand more.

This liberal offer Tycho gratefully accepted; and repairing to Hven, he was present, on the 8th of August, 1576, at the laying of the first stone of a magnificent house, which he afterwards called Uraniborg, or the Castle of the Heavens. This was a building 60 feet square, containing a spacious suite of apartments, an observatory, and a subterraneous laboratory; for the erection of which the King supplied 100,000 rix-dollars (20,000l.), and Tycho himself expended no less a sum. He afterwards constructed a detached building for his observatory, which he called Sterndberg, or the Mountain of the Stars. In this retreat he passed 20 years, and, by his observations and studies, greatly contributed to the improvement of the science of astronomy. He maintained ten or twelve scholars, whom he instructed in mathematics and astronomy, and whom he employed as his amanuenses in his observations. His retreat was not, however, that of an hermit, who secluded himself from society; but he lived in a frugal and hospitable manner, affording free access and liberal entertainment to all visitors. Among these were persons of the highest rank, such as Ulrice, duke of Mecklenburgh, with his daughter Sophia, queen of Denmark; William, landgrave of Hesse-Cassel; and James VI. king of Scotland, and afterwards James I. of England, on occasion of his repairing to Copenhagen in 1590 for the purpose of concluding his marriage with the princess Anne. James remained with Tycho eight days; and, on leaving him, made him a handsome present, granted him a royal licence for the publication of his works, accompanied with an honourable testimony to his talents and learning, and competed fomic
same Latin verses in his praise, more expressive of elegance and admiration, than remarkable for classic elegance. In 1592 Tycho had the honour of a visit from his own sovereign, Christian IV., then in the 15th year of his age; who ex- pressed great satisfaction in examining his astronomical and chemical apparatus, and proposed to him several questions on various points of mathematics and mechanics, and particularly on the principles of fortification, and the construction of ships. He was also highly delighted with a gilt tin globe, which represented the face of the heavens, and being turned on its axis, exhibited the rising and setting of the sun, together with the motions of the planets and heavenly bodies. The king, upon being presented with this curious machine, acknowledged the favour by the donation of a gold chain, and by an assurance of inviolable protection and encouragement. Notwithstanding these assurances, the ene- mies of Tycho, jealous of his merit, or offended by the violence of his temper, and the severity of his satire, con- trived, in 1596, under various pretences, to divert the young king’s attention, and to induce him to deprive the astrono- mer of his pension, his fee, and the canony of Roskilde. Thus deprived of the means of supporting his expensive establishment at Uraniburg, Tycho was reduced to the nece- ssity of quitting his favourite residence, and repairing to Copenhagen, where for a short time he continued his observa- tions. But the malicefulness of his enemies pursued him; and therefore, after having transported from Uraniburg all those parts of his apparatus which could be removed, he departed from Copenhagen with his wife and family, landed at Rosice, and remained a year at Wanbeck, with his learned friend Henry Rantzau.

About this time he published his astronomical treatise, intitled “Astronomia infinita mechanica”; and having dedicated it to the emperor Rodolphus II., who had a rule for mechanics and chemistry, he received from him an invitation to settle at Prague, whether he removed, towards the close of the year 1598. The emperor granted him a magnificent house, assigned him a pension of 2000 crowns, and promised him a fee for himself and his dependants. Here he seemed to have obtained a fixed settlement for himself, and his sons, and his scholars, among whom was the famous Kepler; but he did not long enjoy the advantages of this situation. About a year before his death, he felt symptoms of declining health, occasioned, probably, by his intense application, and by the chagrin he had suffered on his removal from Uraniburg; to which he was himself con- cious, though he concealed them as much as possible from his friends. But the immediate cause of his decease was a strangled, brought on by drinking more than he was acc- ustomed to do, at the table of a lord named Rosenburg, and by an immoderate abuse of wine; and attended with exasperating torments, which occasioned a violent fever, and a temporary delirium; in the paroxysms of which he was heard frequently to exclaim, “Ne frustra vivi X videar;” i.e. that he may not seem to have lived in vain. When the fever subsided, and he recovered his senses, he was well app- rised of his approaching end. In the prospect of it he gave necessary orders with composure and resignation, an- mitted himself with composing an extempore copy of verses, sung various hymns, offered up prayers to the Supreme Being, recommended to his family and friends piety and submission to the divine will; charged his sons, that none of his works should be lost; exhorted his pupils to perchance in their studies, and converted with Kepler on the abstruse parts of astronomy, and requested him to complete the Rodolphine tables which he had commenced for regulating the motions of the planets. Thus employing his last moments, he expired so quietly, that he was neither heard nor seen by any of those who were present, to breathe his last. He died October the 24th, 1601, in the 55th year of his age; and was very magnificently interred in the principal church at Prague, where a noble monument was erected to his me- mory. His wife, two sons, and four daughters, survived him.

Tycho Brahe was a man of moderate figure, with light red hair, and a countenance that was rather handsome. As to his mental powers, he combined energy and activity; and thus endowed, he was admirably qualified for arriving at thse eminent attainments by which he was distinguished. His merit as an astronomer is unquestionable; for though he rejected the simple and beautiful system of Copernicus, and endeavoured to reconcile the absurdities of the Ptole- maic hypothesis, he formed a system conformable to the more obvious phenomena, but which did not require any notion of the planet which we inhabit. To this system (for an account of which, see System) he was so zealously attached, that, in his last moments, he defined his favourite scholar, the great Kepler, to follow his hypothesis rather than that of Copernicus. For a further account of his discov- eries, as well as for a concise abstract of his history, see Astronomy. As a poet, Tycho wrote some Latin verses, which are not altogether delusive of classic elegance. He had also a taste for building; he drew the plan of the castle of Cronberg, and sketched the design for the noble mausoleum of Frederic II., which was executed in Italy, and erected in the castle of Roskilde. As a medical practitioner, he was fond of being consulted, and gave his advice and medicines gratis; he invented an elixir, which he calls an infallible remedy for epidemic disorders, and of which he published the recipe in a letter to the emperor Rodolphus. He was likewise a good mechanic, and constructed several automata, which he took delight in exhibiting to the pen- vants; and in his apartments at Uraniburg he had several contrivances, which were calculated to deceive and allanith those who came to visit and consult him. He was also very much devoted to the study of chemistry; and expended as much on the terrestial astronomy, as he styled it, as on the celestial; but he has left no writings on this subject. In- deed, his researches in this department of science, like those of his contemporaries, were directed to the visionary ideale- rata. To judicial astrology he was addicted to a degree that is truly astonishing; and he manifested a proneness to credulity and superstition, very unphilosophical to his learning and judgment. He was an attentive observer of good and bad omens; infomuch, that if he met an old woman on first leaving his house, or a hare crossing him upon his journey, he would instantly return home. He took pleasure in being con- sulted as a fortune-teller; and pretended, that his know- ledge of the heavenly bodies enabled him to observe horo- scopes, and to foretell future events. At his house at Uraniburg, he kept an infane person, who fat at his feet during the time of dinner, and whom he fed with his own hand; and he noted down any incoherent expressions which were uttered by this person, under a pretence, that the mind, in a state of emotion, was capable of predicting future events; and he even believed, that, if any inhabitant of the island was taken ill, this idiot could predict his recovery or decease.

As to his natural disposition, it was irritable, impetuous, morose, and inflexible; and he indulged a humour for rail- lery, to a degree that gave offence; but while he railed others without reserve, and becoming cautious, he was easily provoked by the raillery of others. If, however, we divert our attention from the unfaovourable to the brighter parts of
his character, we shall be justified in adopting the eulogy of his panegyrist Joffenus, in his "Funeral oration," who observes concerning him, that "his studies were life; meditation, delight; science, riches; virtue, nobility; and religion, his constant guide." Gaffius, in his "Equinorum Tychoeae Brachii Astronomorum Corporei vita," gives the following list of his principal writings:

3. "A treatise on the comet of the year 1577, immediately after it disappeared." Upon revising it nine years afterwards, he added a 10th chapter, printed at Uraniborg, 1599.
4. "Another treatise on the new phenomena of the heavens," in the first part of which he treats of the refutation, as he calls it, of the sun, and of the fixed stars; and in the second part, of a new star which had then made its appearance. 5.
6. "Nuremberg, 1602, and Frankfort, 1610. It was dedicated to Maurice, landgrave of Hesse; because it contains a considerable number of letters of the landgrave William, his father, and of Christoph Rothmann, the mathematician of that prince, to Tycho, and of Tycho to them. 6.
11. "The Rudolphine tables," revised and published by Kepler, according to Tycho's desire. 11.
14. "Hilfmann celestis; or, a history of the heavens, in two parts," the first containing the observations he had made at Uraniborg, in 16 books; the latter containing the observations made at Wittenberg, Prague, &c. 14.

The apparatus of Tycho Brahe, after having been transported from place to place, during his life, was, after his death, purchased of his heirs by the emperor Rodolphus for 22,000 crowns of gold. The persons to whom customarily they recommended them, concealed them from inspection; and thus they remained useless till the time of the troubles of Bohemia, when the army of the elector palatine plundered them, breaking some of them, and applying others to different uses. The great celestial globe of brass was preferred; carried from Prague, and deposited with the Jesuits of Neyfia in Silesia, whence it was afterwards taken, about the year 1633, by Udachec, son of Christian, king of Denmark, and placed in the hall of the royal academy at Copenhagen. Gaffius, uti supra. Moret. Cosse's Travels in Denmark, Kr. vol. v. p. 701, &c. 8vo. Gen. Dict.

its nutrition, from the dura mater, than from the pericranium.

The dura mater, which is a very thin, dense, and inelastic membrane, consists of two layers, intimately connected in general, but separated from each other at particular parts, so as to leave vacuities between them called sinuses, into which the veins of the brain pour their blood. (For an account of the sinuses, see Venas, distribution of.) Its structure is obviously fibrous; the fibres not following any regular distribution, but intersecting each other in every direction. After being macerated for some time in water, it is resolved into a firm tenacious kind of cellular texture. The sides of the membrane are covered by the ramifications of the arrecta meningea media, which are very conspicuous on the mere removal of the skull cap, each branch being accompanied by two veins. (For the description of this artery, see Art. Arteries, distribution of.) In the middle of the superior surface of the membrane is a depression, extending from the lower part of the os frontis to the tentorium, which denotes the situation of the superior longitudinal sinus.

We also observe, on the upper part of the dura mater, clusters of little white granular bodies, termed glandula Pacchioni. These vary in number and situation; sometimes they rise in little heaps on the side of the longitudinal sinus, and are lodged in considerable cavities formed in the bone for their reception. In other instances the clusters of these glands are so small and few in number, that they may escape observation. In dissecting the brain, we are in the next place to cut the dura mater round on a level with the bone which we have torn, except in front and behind, where the falx is situated. We are then enabled to reflect it on either side, from those membranes which immediately invest the brain. Its inner surface is smooth and shining, and has no connection with the pia mater, except at the upper part, near to the longitudinal sinus. The connection at this part is of two kinds: one by means of large veins, which, coming from the surface of the brain, pass between the layers of the dura mater to terminate in the longitudinal sinus; the other by means of clusters of glandula Pacchioni, which adhere equally to the under layer of the dura mater, and surface of the membranes, which more immediately invest the brain. These glands are found not only in the outer and inner layers of the dura mater, but frequently they communicate and make one cluster through an opening in the membrane. They are also found attached to the inner surface of the longitudinal sinus. The use of these glands, as they are called, is not known.

The internal layer of the dura mater forms, by its secessation from the outer, a convexit for the support of the brain: the principal of these are, one which descends perpendicularly between the hemispheres of the cerebrum, and is called the falx cerebri, from the shape of its lower edge, and which proceeds transversely, supporting the back lobes of the cerebrum, and separating them from the cerebellum. As this is stretched across over the cerebellum, it is called the tentorium cerebelli. The falx is a duplicature of the internal layer of the dura mater, which begins to proceed from the external at the sphenoid bone, and inclines the critta galli of that bone. It proceeds in like manner from the spine, and from the middle of the os frontis, from the sagittal suture of the parietal bones, and from the upper half of the perpendicular ridge of the occipital bone, and it terminates behind in the tentorium, gradually increasing in breadth to its termination.

The arteria meningea media is the principal source of the arterial supply of the dura mater: it receives some small branches in front from the internal carotid, ophthalmic, and pharyngeal arteries: behind from the occipital and vertebral vessels. Its veins open into the nearest sinuses. The accurate researches of Lobel's and Wrisberg have shown that no nerves can be traced to this membrane. (See Comment Gutttingius: an. 1777, Ludwig collect. scrip. neurol. minor. tom. 1.)

After the connection of the dura mater with the subjacent membranes is broken, the front of the falx is to be divided from the cribrum galli, and that proceeds to be turned back from between the hemispheres of the brain. Then the brain and its immediate investing membranes become fairly exposed to our examination. These membranes were considered as one, and called the pia mater, till Ruyfch demonstrated that they were two. The outer one is uniformly spread over the visible surface of the brain, is of a pale white colour, yet in some degree transparent, very thin, devoid of evident vessels, and is named the tunica arachnoidea. It is seen most distinctly when it passeth between the two lobes of the cerebellum: in most other parts of the brain it adheres very firmly to the pia mater. Although the tunica arachnoidea has in its natural state no visible vessels, yet, when it is inflamed, its vessels become enlarged and evident, and there can be no doubt but that it contributes at all times to secrete its share of that liquor which separates it from the dura mater. In inflammation of the pia mater and tunica arachnoidea, it is common to have a turbid and sometimes puriform fluid effused between it and the dura mater, which is doubtless secreted by the inflamed membrane.

The membrane which lies beneath the tunica arachnoidea is called the pia mater; it covers the whole surface of the brain, sending down processes between all its convolutions. It is extremely vascular, and a great portion of the blood, which the brain receives, is spread out upon its surface in minute vessels: from these others proceed capable of admitting very suble injections. From the great number of vessels, which ramify on this membrane, Socinian calls this membrane, membrana vaeclusa cerebri. Its vessels are fewer and smaller where it covers medullary parts, than where it is in contact with the cortex. The processes which pass from its inside no where touch medullary matter. The outer surface is tolerably smooth; the inner universally villous, from the torn orifices of innumerable vessels which entered the substance of the brain.

The membranes of the brain having been examined, may be removed; and then the surface of the cerebrum is brought into view, which appears convoluted, so as to resemble the windings of the small intestines. These convolutions do not in general penetrate more than one inch, or one inch and a half, into the substance of the cerebrum. A very deep sulcus is however observed extending itself obliquely upwards, and backwards, from the alae of the sphenoid bone; and this is called the sifura magna Sylvii.

The encephalon or brain is divided into the cerebrum, cerebellum, and medulla oblongata.

The cerebrum is the uppermost portion, and by much the largest, and that which first claims our attention in dissection. It rests upon the tentorium and petrous portions of the temporal bones behind, and upon the sphenoid bone, and the orbitary processes of the frontal bones in front. Its superior surface presents a regularly convex oval, narrower in front than behind. This oval is divided into two equal parts named hemispheres, by a deep longitudinal sulcus, into which the falx cerebri descends. The depth of this cleft being greater than the breadth of the falx, the opposed plane surfaces of the hemispheres are loosely united below the inferior edge of the falx, by vessels and cellular sub-

stance.
flance. The hemispheres are conjoined below, and the part
which unites them can be perceived at a considerable depth
from the surface, by dissecting the hemispheres from each
other. It is about three inches in length, and is called
the corpus callosum. (In a singular instance, which occurred
to Mr. Carlile, the falx was deficient, and there was no division
into hemispheres. See Trans. of a Society for the
improvement of medical and chirurgical knowledge, vol. i.
p. 212.) Each hemisphere is divided into two lobes. This
subdivision is the consequence of the projection of the tran-
verse fissure process of the sphenoid bone, which divides
the bottom of it into two surfaces; and it is from this
division that the fissura Sylvii commences. All that part
of the hemisphere which is in front of the fissura Sylvii, and
which rests on the orbit, is called the anterior lobe; and all
that which is supported by the sphenoid ale, by the
petrous part of the temporal bone, and tentorium, is called
the posterior lobe. Such is Haller's division of the cerebrum,
which has been generally adopted by anatomists. Some
authors, however, divide the posterior or great lobe into two
parts, calling that portion of it, which rests in the middle
fossa of the half crani, the middle lobe of the brain; and
that which is supported by the tentorium, the posterior
lobe.

As there are no distinguishable parts in the upper portions
of the hemispheres of the cerebrum, so in dissection it is
 customary to pare all these away, nearly to the level of the
corpus callosum, in order that we may be able more easily
to open, and more particularly to examine, certain cavities
which are situated on either side of that body, and which are
called the lateral ventricles. On making a section of the
brain we perceive that it is composed of two substances,
an exterior one which is of a grey colour, and an interior one
which is white. These are termed simply the cerebral and
white substanacies, or sublunaria cinesa and alba; or, from
the former surrounding the latter, as the bark does the wood
of a tree, they are named in contra-distinction, the cortical
and medullary substanacies of the brain. The cortical part
receives so great a supply of blood, that after a successful
injection it appears almost composed of vessels; the medul-
lar substanacy on the contrary has very few vessels. In the
crura cerebri is a small portion of a black substanacy, named by
Soemmerring locus niger; and, in some places, a fourth
substanacy, partaking of the appearances of the cortical and
medullary matter, is described, as in the under surface of
the posterior lobe, and is named by Soemmerring portio
intermedia.

When the substance of the two hemispheres has been re-
moved by repeated horizontal sections, as low as the surface
of the corpus callosum, we see the greatest extent of
medullary matter, that can be demonstrated in the brain.
The medulla of the two hemispheres is united by the corpus
callosum. The margin alone is grey; all the rest is
white. This appearance is the centrum ovale of Villenuev:
The maximus medullae orbis of Soemmerring: a more complete
view of the corpus callorum is now obtained. This part is
overlapped by the edges of the two hemispheres, in such a
manner that it is completely hidden, until the hemispheres
are either held asunder, or removed by dissection. Its
length is equal to that of one half of the hemisphere, and it
is placed in such a situation, that a space equal to one third
of its own length is left, between its anterior extremity and
the front of the cranium, and another twice as long between
its posterior part and the back of the skull. The breadth of
this part is about 3/ of an inch, but less in front. Its upper
surface is convex. It turns downwards in front and behind,
so as to form two rounded extremities, which are the
bourrelets antieur and posteiior of Vieq d'Azyr. Two
prominent lines run through the whole length of the corpus
callosum, with a depression between them, which is called
the raphe. Transverse lines proceed from these on both
sides at right angles.

The two lateral ventricles (ventriculi tricornes of Vieq
d'Azyr) are situated in the substance of the brain, by the side
of the corpus callosum. (one in either hemisphere,) and should
be opened by an incision along the margin of that body.
The roof of the ventricle being dissected off, its course
becomes apparent. The cavity begins in the front lobe of
the brain, as far forwards as the commencement of the
corpus callosum. This portion of the ventricles, which is
formed between the front of the corpus striatum and the
medullary matter of the front lobe, turns rather outwards,
and is distinguished by the name of corna anterior. The
ventricle then runs from before backwards, in a direction
parallel to that of the corpus callosum, and diverging from
the opposite one. Afterwards it bends downwards, some-
ting like the turning of a ram's horn, and returns obliquely
from behind forwards, to terminate almost under its superior
extremity, being situated however behind that, and more
externally. This is the cornu inferior, or defensores,
or reflected horn of the ventricle. At the place where the
ventricle bends in order to run downwards, there is a par-
ticular elongation paining into the posterior lobe, forming
a triangular pointed cavity, terminating in a cul de sac, with
its point turned inwards. This is the digital cavity or
cornu posterior of the lateral ventricle. Its length and size
vary considerably in different subjects and often are very
dissimilar in the right and left sides of the same brain. It
sometimes extends quite to the posterior part of the back
lobe, and at others is barely demonstrable. This part of
the ventricle is peculiar to the human subjext and affinis.
These ventricles, and some other cavities, which will be
previously described, are lined with a smooth membrane,
and prevailingly described, are lined with a smooth membrane,
which serves to preserve the pareties of the ventricle separate and distinct
from each other, and to fill up the spaces which are left
between the convexities which constitute the sides of the
cavity. The diffe of hydrocephalus is a morbid increase of
quantity in this fluid, which accumulates sometimes to the
amount of some pounds, dilating and distending the ven-
tricles enormously. The learned Soemmerring, who may
justly be esteemed the first of modern anatomists, places the
fenestrum commune in this fluid. He has traced all the nerves
of the brain to the sides of the ventricles; and concludes, that
impressions made on these nerves will be transmitted to the
water of the ventricles, which he considers as the organ of the
foul. (See his dissection euer der mus organ der felle.
Borohn, 1796, 4to.)

The two lateral ventricles are separated by a perpendicular
partition, which depends from the inferior surface of the

The two lateral ventricles are separated by a perpendicular
partition, which depends from the inferior surface of the
corpus callosum to the fornix. This septum, which is broad
in front, grows gradually narrower behind, and, at the poster-
ior part of the ventricles, does not exist at all; the corpus
callosum and fornix being there continuous. It is com-
poised of two thin layers, separated above and uniting below
at an acute angle, so as to leave between them a triangular
cavity, called the fifth ventricle of the brain, or ventricle of
the septum lucidum. The corpus callosum may be cut off
from the septum lucidum, so as to shew the two layers and
interposing ventricle.

The fornix is composed of two crura, which arise in front
of the brain, from the corpora subrotunda. These, which are
round in shape, converge, and unite to form the fornix,
which lies between the two corpora fritata, and on the upper
surface
 BRA

Office of the thalami nervorum ep ACTM. It separates behind are two posterior horns, which are thin, broad, and flat, and pass into the reflected horns of the ventricles, where they run along the front of the hippocampal major, and soon terminate. Their posterior margin is connected to the hippocampus, the anterior is broad and floating, and forms the bandelette du hippocamp of Vicq d'Azyr. The triangular space left between the posterior horns fornices, where they diverge to enter the reflected horns of the ventricles, is filled up by medullary matter marked on its under surface by several oblique lines; it is called trigonium pteralium, or corpus pteralium. It may be regarded as the under surface of the corpus callosum. The origin of the fornix in the front of the brain is situated at some distance from the corpus callosum; it diverges gradually in an arched manner, until it reaches the under surface of the corpus callosum, before its separation into the posterior horns. On this circumstance depends the different breadth of the septum lucidum in the front and back part of the ventricles. Under the anterior part of the fornix is a small slit-like opening, by which the two lateral ventricles communicate. This aperture is just in front of the thalami nervorum opticiun, and precisely over the fornix commune anterior. It becomes considerably enlarged, in cases of great accumulation of fluid in the ventricles. The communication between these cavities would be much more extensive, did not the fornix behind this aperture adhere to the choroidal plexus and velum, which intervene between its under surface and the optic thalami. The thin edge of the fornix, and of its posterior horns, receives vessels from this vascular membrane. The fornix should now be cut through opposite to the communication just described. By turning up the anterior part of this body, its origin is by two distinct horns becomes clear, which would not be satisfactorily made out on the upper surface. By reflecting the posterior part, the pteralium, the separation of the posterior horns, their course, flat shape, extenuated margin, and pointed termination on the hippocampus, will be clearly exposed.

In this stage of the dissection, the situation and connections of the choroidal plexus may be traced. This is a production of the pia mater, containing a vast number of tortuous, arterial, and venous ramifications, entering the reflected horn of the ventricle, and ascending into the superior part of the cavity. It is broader and lower below, diminishes in size, as it proceeds along the upper part of the ventricle, and terminates just at the opening of communication between the two lateral ventricles, by joining the opposite plexus. The right and left plexuses are joined together by a middle expansion under the fornix, which is the velum, five plexus choroides interpositus of Haller, or the rete, or tela choroides of Vicq d'Azyr, who has illustrated these parts by the most beautiful coloured plates which have ever been published on any anatomical subject. (See particularly Tab. 7, also Tab. 5, and 8.) The two plexuses, with the intercommunicating velum, cover the hippocampi majores, the pineal gland, and upper surface of the optic thalami. They support the fornix and pteralium, intervening between them, and the optic thalami, and giving blood-vessels to all the parts just enumerated. When successfully injected, these plexuses resemble a mere net-work of blood-vessels. They contain numerous little glandular bodies, which are often enlarged, so as to resemble hydatids. The veins of the choroidal plexus form a large trunk situated in the middle of the velum, and named the vena magna Galeni. This, passing in the angle of connection of the fells and tentorium, constitutes the torcular Herophili. The choroidal plexuses and velum should now be reflected, to expose clearly the eminences which form the fids of the lateral ventricles. We now see, in the middle of the under surface of the velum, a small and narrow portion of plexus, which was first described and represented by Vicq d'Azyr under the name of plexus de la glande pinacale ou du troisieme ventricule. (Tab. 7, fig. 4, p. 21.) The anterior and superior eminence in each lateral ventricle is oblong, smooth and grey on its surface, but composed internally of a fibrillated mixture of cortical and medullary substance, whence it derives the name of corpus striatum. The more deeply we cut into this body, the more complicated does its fibrillated texture appear. The corpora striata are large, convex, and near to each other in front; they diminish in size, and diverge behind, being separated by the optic thalami, and presenting on the whole a pyramidal appearance. The posterior eminence of the lateral ventricle is called the thalamus, or colliculus nervi optici. It is found behind, within, and rather below the former. Its surface is white, but the interior of the body is formed of a fibrillated intermixture of cortical and medullary matter; in shape, it is nearly hemispherical, except that it is surrounded above by a more or less prominent oval tubercle, which extends from before backwards. The convexities of the optic thalami are turned towards each other, and are connected by a crenulated union, which is called the middle commissure of the brain, or soft commissure of the optic thalami. This union, which is naturally of a soft and delicate nature, is torn by the mere weight of the parts, when the brain has been kept a few days before it is used for dissection. Hence some anatomists have denied its existence altogether. This is the opinion of Sabatier, derived, as he says, from the most exact observation and very numerous dissections. (Traité d'Anatomie, tom. ii. p. 32.) The careful examination of a recent brain will show the error of this celebrated anatomist; and if authority be required on a point which can be made the subject of demonstration, it will be sufficient to cite the names of Vieussens, Winslow, Morgagni, Soemmerring, and Vicq d'Azyr. These bodies separate from each other below, and form a cavity, which is the third ventricle of the brain. The thalamus neri optici is separated from the corpus striatum, by a whitish, fibrous, and flat cord, which is broader in front than behind. This arises from the front of the third ventricle, and following the posterior margin of the corpus striatum, was named by Willis limbus posterior corporis striati. It descends into the inferior horn of the ventricle, and terminates on the upper surface of that cavity. This part is the centrum geminum f.uncirculari of Vieussens, the tensor f.uncularis of Haller, bandelette f.uncic of Vicq d'Azyr, and thia cornae of Soemmerring. The posterior and reflected horns of the ventricle contain certain eminences, which are named hippocampi. The posterior margin of the corpus callosum mixes on either side with the medullary matter of the brain, and produces in the digital cavity one or more small projections, corresponding in direction to the course of the cavity, and named colliculi, or angulus caveus posterioris ventriculi lateralis (pert., or hippocampi minor of Vicq d'Azyr).

In the descending horn a very large and conspicuous medullary body is seen, extending to the termination of the ventricle, where it forms a bulbose extremity divided by three or four furrows, in such a manner as to bear an obsevere resemblance to the foot of an animal. The eminence is named hippocampus major, or cornu Ammonis (proc. cebcri lateralis Soemmerring de corporis homani fab. tom. iv. § 36.), and its termination pes hippocampi.

It is necessary to remark in this place, that the hippocampi are continuations of the medullary matter, which forms the corpus callosum; and that the corpus callosum itself,
itself, the septum lucidum, fornix, and pia mater, are parts of one continuous medullary body. To understand clearly the relative position and connections of these parts, it is absolutely necessary to refer to the proper source of all anatomical description, dissection of the parts, which will show how inadequate a notion of these circumstances is obtained from the belt description.

An oval opening is seen between the optic thalami in front, named the foramen commune anterius, which leads into the third ventricle. As it is situated under that part of the fornix, which is not adherent below, it opens by means of the slit above mentioned, as forming the communication between the two lateral ventricles, into each of these cavities. Hence they communicate with the third by means of this aperture. The foramen commune posteriors, which open also into the third ventricle, is a triangular space left between the optic thalami at the posterior part, and only exposed when the choroid plexus and velum have been reflected.

On drawing the thalamus, and separating its soft commissure, we expose a considerable oblong cavity, which is named the third ventricle. In front of this a round medullary cord appears just under the anterior cura of the fornix, which passes tranverse between the two hemispheres, and is continued in a distinct form, for the space of an inch, into the substance of the brain on each side, as will be best seen by a transverse section. A similar body is seen at the back part of the ventricle, which is not however produced into the hemispheres like the anterior one; these are the anterior and posterior commissures of the brain. There is a round aperture under the anterior commissure, beyond which the ventricle terminates by a pointed and conical extremity, from which a small and short cylindrical process is continued to the pituitary gland, under the name of the infundibulum. It is a matter of dispute among anatomists, whether or not this process be hollow. The foramen commune anterius leads through the third ventricle into this opening. Just before the posterior commissure a round opening is found leading through a short canal, in front of the tubercula quadrigemina, into the fourth ventricle. The canal of communication is named canalis medius, iter ad quartum ventriculum, or aqueductus Sylvii.

The pineal gland, or osarum, is found at the back of the optic thalami. Its size is about that of a small horse-bean; its colour a reddish grey; its shape more frequently conical. Two small medullary cords connect it to the posterior commissure and to the optic thalami; they are intercepted in the convex part of the thalamus, and form a distinguishable prominent line, extending quite to the front of that body, as it is very beautifully represented in the 8th plate of Vicq d'Azyr. This gland is covered by the velum, and has immediately over it the two small plexuses, which have been already described under the name of plexus de la glande pineale.

In the substance of the pineal gland, or in the medullary matter, which connects it to the optic thalami, there is found a small quantity of a gritty matter nearly resembling sand. It consists of a number of little translucent and light yellow grains. Soemmering, who first discovered that this was a part of the healthy structure of the brain, calls it the acervulus of the pineal gland. (Dissertatio de lapillis intra vel prope glandulam pinealem fistis, in Ludwig. collect. sect. neurolog. minor. tom. iii.)

The pineal gland rolls on a square portion of the brain, which is seen behind and below the optic thalami, and below the level of the tentorium. The surface of this is divided into four projections or tubercles, and hence it has acquired the name of corpora quadrigemina. Of these bodies the two superior are larger and more plane; the inferior more convex. From the lower bodies a medullary production extends to the upper part of the crura cerebelli. Vicq d'Azyr described this part by the name of the valvula magna cerebelli, supposing it to perform the office of a valve to the fourth ventricle. Vicq d'Azyr, whose incomparable plates throw new light on this as well as on every other part of the subject, calls it the "lame medullaire du cerelet." The lateral portions of this production constitute partly strong medullary bodies, which are the "processus cerebelli ad efferentes" of Haller, "les pedonecales ou colonnes de la lame medullaire" of Vicq d'Azyr. The interval between these is filled by a very thin medullary plate, the velum intermedium of Haller, which is the part commonly known as the valve of the brain. This valve forms the roof of the fourth ventricle; therefore, if air be impelled into that cavity from the canalis medius, the valvula cerebri is elevated, and we can perceive the fourth pair of nerves arising from it; the origin of this nerve evidently projecting from the surface of the valve.

On lifting up the posterior lobes of the cerebrum, a transverse production of the dura mater, called the tentorium, comes into view. This is attached to the internal transverse ridge of the occiput, and posterior angle of the parietal bone behind, and to the sharp margin of the petrous portion of the temporal bone in front, as far forwards as its connection to the body of the sphenoid bone, where it terminates in a pointed form. This process therefore separates the cavity, which holds the cerebellum, from that part of the cranium which contains the cerebrum. The vacany left in its anterior part, opposite to the basilar process of the occiput, transmits the commencement of the medulla oblongata. The middle of the tentorium, which has the termination of the falx fixed to it, is elevated; the lateral portions of the process are rather sloping.

The tentorium should be divided on either side, in order to expose the cerebellum, which then appears lying in the posterior fossa of the occiput. This is divided into a right and left lobe by the falx cerebelli, which is a small process of dura mater, attached to the lower part of the perpendicular ridge of the occiput.

The rest of the encephalon should now be removed from the cranium, that the fourth ventricle and basi of the brain may be considered. In doing this, we lift up the anterior lobes, and detach the different nerves as they go out of the cranium, cutting them near to the brain on one side, and near to the apertures by which they quit the skull on the other. The pituitary gland is to be scooped out of the sella turcica, and the medulla spinalis to be cut across as low down as possible.

The part which has been taken out should be laid on a plate, in the same situation which it held in the cranium, that the fourth ventricle may be demonstrated. This cavity is formed between the upper and posterior part of the medulla oblongata, and the middle anterior part of the cerebellum. It extends laterally to a considerable distance in the crura cerebelli; a groove runs along the middle of the medulla oblongata, which constitutes the front of the ventricle, and terminates in the end of the cavity in a point. From the lateral productions, and the pointed termination of the cavity, it has been named the calamus scriptorius. Its shape indeed bears considerable resemblance to a pen, except that it is much larger. To describe its boundaries more accurately, we may state, that it has four ridges or paretises. The superior is formed by the valvula cerebri, the lower and anterior by the back of the medulla oblongata, the two lateral by the crura cerebelli, and in part by the thick portions of the valve, which unite the crura cerebelli.
part, which is divided into four convexities, of which the two superior are named corpora olivaria, the two inferior corpora pyramidalia.

For the most ample and satisfactory information on the anatomy of the brain, we refer the reader to the Esceulatonia Nuova universale di Vincenzo Malamani, Turin, 1780; the "Traité d'Anatomie de Substanter," vol. ii.; the fourth volume of Soemmerring's "De corporis humani fabrica," and his differtation "Ueber das organ der Seele." Above all, however, the "Traité d'anatomie, et de physiologie, avec des planches coloriées," Paris, 1786, Ed. of Vico et Azy, requires the greatest commendation. In this superb work all the parts of the brain are represented of their natural colour, with such fidelity and beauty as renders it, beyond dispute, the grandest book, which has ever been published in illustration of the human frame.

We shall subjoin to this description of the brain, a brief account of the anatomy of the medulla spinalis, and nerves. Thus, we shall include in one article, the structure of the foramen, of the organs which transmit impressions to it, and convey the determinations of the will from it; which are only to be considered as parts of one circle of actions.

Structure of the Medulla Spinalis.

This part is a continuation, as we have already mentioned, from the medulla oblongata, which is formed by the union of the medullary appendices of the cerebrum, and cerebellum. The bulbous portion, which we have before described as forming the corpora pyramidalia and olivaria, is the commencement of the medulla spinalis; although, as it is contained in the cranium, the term of spinal marrow cannot, with strict propriety, be applied to it.

The medulla spinalis consists externally of medullary matter; on making a transverse section, we find a portion of connective substance in the centre, consisting of two fibres, which cross each other, thus X. When covered by its membranes, it is of a firmer consistence than the brain; but it quickly dissolves when laid bare. Its form is nearly cylindrical, but it is compressed before and behind. A groove extends along its anterior and posterior flat surface, and these impressions seem to divide it into two cords. It is larger in the bottom of the cord, and towards the lower part of the back, than in the intermediate spaces. It contracts in the lumbar region into a conical form, and terminates by a small filament, which is fixed to the bottom of the sheath of dura mater.

It sends off a pair of nerves at each interval between the vertebrae, which are named cervical, dorsal, lumbar, or facral, according to the region in which they arise. These nerves are produced by two fasciculi of fibres, one of which comes from the front, the other from the back of the cord. These are separated by a membrane, which will be presently mentioned, and penetrate the dura mater by two distinct holes, after which they unite to form a ganglion. The arteries of the dura mater are derived from many sources; the vertebrai furnish an anterior and posterior one. The others are derived from the cervical, intercostal, lumbar and facral arteries, which enter at the openings, through which the nerves go out, and communicate with the spinal branches of the vertebrae, so as to keep up their force to the end of the medulla spinalis. The veins, which are also numerous, pour their blood into two longitudinal sinuses, formed in the dura mater, which lines the vertebral canal, and extending the whole length of that canal. These communicate together by transverse portions at the intervals of the vertebrae. They communicate in the neck with the vertebral veins; in the back, with the intercostals; and below, with the lumbar and facral veins.
The spinal marrow is covered externally by a production of dura mater, which extends from the great occipital foramen to the bottom of the facia, connected throughout to the vertebral canal, by a loose cellular and adipose substance; and at the intervals of the vertebrae by the conical processes, which it attaches to the commencement of the nerves. The tunica arachnoid is much more loosely connected to the vacular membrane, than it is in the brain.

The pia mater surrounds the spinal marrow very closely, inasmuch that, in making a transverse section, the medullary matter protrudes from the cut surface. The medulla spinalis is connected at the side to the dura mater by small portions of membrane, which are found between the anterior and posterior origins of the nerves, and are inserted in a pointed manner into the dura mater; it is called ligamentum dentatum. For descriptions and representations of the medulla spinalis, the reader may consult Huber de medulla spinalis, Goetting. 1741, which is also contained in the Icones of Haller; Monro's observations on the nervous system, and Fratlicher decretito medullae spinalis cum icone, Erlang. 1783.

Structure of the nerves.

The nerves are felt, white and fibrous chords, nearly of a cylindrical shape, arising from the brain, or medulla spinalis. When they leave the brain, the pia mater collects the fibres into larger or smaller fasciculi, which can be seen without any previous preparation, by making a longitudinal or transverse section of a pretty large trunk. Where the nerves penetrate the dura mater, they are firmly connected to the margin of the opening, and have been supposed to receive an external cost from that membrane; this, however, is only true of the optic nerve. The medullary filaments of the nerves are covered by a vacular membrane called by Reil neurilema, which detaches proceeds from its inner surface, to surround and inviolate the smaller divisions and fibres of the medullary substance. Byimmerging a nerve in alkali, the medulla of the nerve is dissolved, and the contained membranous tubes formed of neurilema are left. Acids dissolve the neurilema, and leave the medullary fibres. These organs receive a considerable supply of blood from vessels which ramify on the neurilema, as those of the brain do on the pia mater. The cellular texture, which constitutes the vacular membrane of the nerve, is resolved on its surface into a loose substance, which connects the nerve to the surrounding parts. By maceration in water, and careful diffusion, a nervous trunk may be separated into numerous threads; and each of these, when examined in a microscope, forms to be an assemblage of proportionally smaller fibres. Greater magnifying powers show these fibres, which before appeared single, to be still composed of smaller threads; and it is doubtful, whether the ultimate nervous fibre can be discovered. All that is said, therefore, of the form, conus, &c. of these ultimate fibres, is wholly conjectural. Microscopic observations, however, show many transverse thickenings in the substance of nervous trunks, of a more lucid appearance than the rest, which disappear on stretching the nerve, and are restored by again letting it loose. This appearance characterizes the smallest perceptible fibres, and enables us to distinguish them from muscle, tendon, &c. Fontana probably alludes to this circumstance, when he calls the nervous fibres, waving cylinders. The fibres do not proceed in a straight uninterrupted course, but join frequently with each other, so that, according to the expression of Monro, they form a plexus in each nervous trunk. The experiment of Reil, of immersing the nerve in nitric acid, to dissolve its membrane, shews this, as well as microscopic observations. A nerve, when divided in the living subject, retracts: the medulla is expressed from its extremities by the contraction of its membranes, in the form of globules, more copiously, according to Prochaska, from the upper, than the lower end. This protrusion of the medullary matter takes place in a less degree in the dead subject. If a nerve be cut in a living animal, and he be killed at some period after the operation, it will be found, that the divided extremities have swollen into a small tube, and that they are connected by a new formed matter. Anatomists have disputed greatly, whether or not this were real nerve, whether it was a regeneration of medullary matter. As it would not probably be very easy to decide this question, by merely anatomical testimony, from our ignorance of the minute structure of these organs, it appears most philosophical to inquire, whether the new matter will perform the functions of a nerve; and this has been completely proved by the experiments of Dr. Haighton, in the first part of the Philosophical Transactions for the year 1795. In some parts of the nervous system, little tubercles or knots, called ganglia, are found in the course of the nerve; and are usually formed by the concurrence of several branches. These bodies are of various figures, but generally flattened. They partake more of the red colour, than the trunks of the nerves on which they are formed, as they possess more numerous blood-vessels. They contain several nervous fibres, distinguished by their peculiar characteristics, and surrounded by a pretty firm vacular substance. The fibres communicate in these bodies, and each nerve which goes from a ganglion, is said to possess some fibres of every other nerve which joins it. For a further account of the structure of nerves, the following works may be consulted: Reil Exercitationes Anatomicae Prochasiae de Structura Nervorum; Monro's Observations on the Structure and Functions of the Nervous System; Arman verifique an lebendigen Thieren; Fontana Traite sur le Venin de la Vipere, &c.; Haebe de ganghia nervorum; Scarpa Annalientes Academicae.

Brain, Physiology of the. Having described the anatomy of the brain and nerves, we proceed in conformity to the arrangement adopted in this book, to speak of the functions or physiology of these organs. The first circumstance which it appears necessary to discuss in this intricate and interesting subject, is the inquiry respecting the place in which sensation exists. There could scarcely be any thing more difficult than to convince a person who has never thought on this point, that feeling resides solely in the brain, and that its beliefs, that it exists in the tangible extremities of the nerves, is a deception; and yet there is nothing of which men of the strongest minds, and who have most attended to the subject, are more perfectly convinced. The circumstances which have induced them to entertain this belief are, 1st. that if the continuity of the nerve between the extremity which receives impressions from the objects of feel, (and which we shall, therefore, call the tangible extremity of the nerve,) and that extremity which terminates in the brain, (which is usually denominated the sensorial extremity,) be by any means intercepted, both feeling and voluntary motion are suspended. 2dly, The false judgment which the perceptive forms of corporeal disorders, confirms this opinion. If a nerve be irritated at the middle space between its origin and termination, severe pain is suposed to be felt in those parts to which it is distributed; and if it supplies muscles, they become convulsed. If a diffuse forms about the hip-joint, or in the loins, the patient frequently complains of violent pain on the inside of the knee, without advertance to the real seat of the disorder. And people who have had their limbs taken off, can scarcely
It is believed that they are removed from their bodies, in consequence of the pains and sensations which they seem to feel in them. In either of these cases motion is produced in the middle of a nerve, which being transmitted to the brain, is attributed by the perceiving to a disordered state of the parts, from which it had been accustomed to receive impressions. Again, if a certain degree of pressure be made on the brain, all sensation and voluntary motion are interrupted. As these circumstances have been so well explained by Haller, we shall not enlarge on this subject, but proceed to consider the means, by which this transmission of motion from one end of the nerve to the other, is probably effected.

From the earliest times in which men contemplated the animal economy, reflecting persons imagined, that they perceived some subtle invisible agent, which operated in the performance of the animal functions. Hippocrates attributed actions, which he could not otherwise account for, to something which he called nature; Paracelsus, to the operation of an archer; Stahl, to different unities; and Harvey seems to have had an idea of a vital principle. But it may be seen, that such opinions, the credit of which discredited that a subtle invisible matter was diffused throughout living bodies, and was the cause of many phenomena occurring in them, belongs to Mr. Hunter. This opinion he has endeavoured to prove by experiments, which will be noticed under the article Life. The most conclusive arguments in favour of this opinion will probably be given under the physiology of Muscles, in elucidating the cause of muscular motion, and to these the reader is referred.

It has been customary to consider matter as passive, and to denominate the active power which puts it in motion, by the name of spirit; but we relinquish the pursuit of the primary cause of the motions of matter, because we know nothing of the substances which we usually denominate matter or spirit. These appellations have been given to them from their properties, which we do know. We know nothing of matter, but some of the properties which different species of it possess. Of that matter, which, for the most part, presents itself to our notice, when collected together in such quantity as to be cognizable to the eye and touch, we know that it possesses a property, called by Sir Isaac Newton inertia, an indispersion to move, unless impelled to it, and a propensity to continue in motion, unless retarded. But there are other substances in the universe which are usually considered as material, such, for instance, as electricity and magnetism; the motions of which do not seem to be regulated by the same laws, and which are cognizable neither to the eye nor touch, but of the existence of which reason furnishes us with the most indisputable testimony. Of these kinds of subtle and mobile matter, we know that they frequently act upon, and put in motion that which is more gross and inerte. We fix, magnetism move even ponderous pieces of iron, and electricity diffuse and disperse the most inelastic substances which oppose its passage. The reasons for entertaining the opinions of Mr. Hunter, that there is a fluid, mobile, and invisible species of matter connected with the evident structure of living bodies, as magnetism may be transferred to iron or electricity to various substances, will be detailed under different articles in this book. At present, we claim permission to employ this explanation of the phenomena of life, because there appears nothing improbable in it, or inconsistent to prevent philosophical notions; and it is a supposition, which appears, not only verifiable, but adequate to account for the phenomena which occur in living bodies. By employing this mode of accounting for the actions of life, we avoid all inquiry into the primary cause of the motions of matter; we contemplate only a secondary cause, such as takes place in electrical and magnetic experiments, in which a subtle species of matter puts in motion that which is more gross and inerte.

If it be admitted, that sensation extails in the brain, and volition proceeds from that part, it necessarily follows, that a motion must be transmitted along the nervous cords, whenever these effects take place. It was formerly supposed that these cords were passive, and might be made mechanically to vibrate; but their want of elasticity and tension, and their pulpous origins and terminations, are circumstances which rendered this supposition inadmissible. Physiologists were, therefore, induced to suppose, that the nervous fibres were tubular, and that they contained a subtle fluid, by means of which such motions were transmitted. Haller's opinion of the nervous fluid appears sensible and according to the philosophical opinions of his time. He says, "Si vero cogitata nostra de ipfa natura spirituum proveferer jubemur, actium ad motum a voluntate et a fehlic concipiamus aptimum calceum omne fermentum acie fabulatun, tamen hactenus igne et atheere et electo, et magnetica materie crausius facere elementum, ut et contineri vallis in vinculis coercer aptum fit, et desinque manufiun ex cibus maei et reparati quasi." But, at present, no one will doubt the possibility of a subtle and mobile fluid inhering in cords, and moving along them without being contained and confined in tubes. Does not electricity move along a wire? and is it not probable that a subtle fluid may inher in a substance, in consequence of an attraction which it possibles to it, and more particularly, if the substance which attracts it is surrounded by others, which may be regarded as non-conductors. The celerity with which motions are transmitted from the tangible extremities of those nerves which are most distant from the brain, and the celerity with which volition is transmitted to muscles in consequence of sensations thus occasioned, are sufficient to convince us that these effects must be produced by the medium of a very mobile matter. It is not necessary to suppose, when motions of a subtle matter are transmitted along the nervous cords, that an evident motion of the visible matter of those cords should take place. This opinion, that sensation is caused, and volition directed through the medium of a subtle, invisible matter, inhering in the nervous cords, is so like the opinion of Hartley, of the phenomena of the nervous system being produced by the vibrations of an ether, that it is not necessary, in this place, further to prosecute the subject. We rather refer the reader to his work, for a more ample illustration of this theory.

Formerly it was supposed, that the motions of the nerves, which cause sensation, were the mere effect of an impulse made on their tangible extremities by the bodies which we feel. It seems to be an improvement in modern physiology, to impute the nervous motions to an action begun in them, in consequence of the stimulation which they suffer from such impulses. This opinion is contended for by Doctor Darwin, in his paper on "Ocular Spectra", inserted in the Philosophical Transactions; and Mr. Home has further shown, in the Croonian Lecture for the year 1807, inserted in the Philosophical Transactions, that nerves have an irritability resembling that of muscles, which produce a contraction in them when they are divided. This opinion affords us an understanding how our sensations may be very vivid from the slightest impulses; such as, for instance, take place from the application of the particles of odour to the olfactory nerves, for it is not the impulse, but the consequent action, that is transmitted to the sense organ; and why we
We may have no sensation from the most violent impulses, for such we cannot but suppose to take place when a limb is removed by a cannon ball, a circumstance which has happened without the consciousness of the person to whom it has occurred.

These hypotheses appear to us adequate to explain all the circumstances that have been noticed relative to the functions of the nervous system. To review the circumstances, even with the greatest possible brevity, would render this article too extensive. Yet, there are some particulars which the reader may expect that we should advert to. Of these, it is right to mention, that the disposition of the nerves to act, is increased, as the causes exciting their action is diminished. This circumstance has been expressed, we can scarcely lay explained, by the late Doctor Brown, in his "Elementa Medicina," by saying, that the excitability of the nerves is augmented in proportion to the deficiency of the exciting causes. This fact is productive of consequences which appear particularly beautiful and useful; it furnishes a power of accommodation in our senses to the varying circumstances of life. Thus, for instance, a person confounded in the dark, shall receive the impression of light from a very small quantity of light, and his eyes would even be injured by the common day-light. The reverse of this is equally true: that a person shall live in a strong light, till his eyes become accustomed to it, that a lens quantity shall not produce a proper impression; or a person, who has long been in a still and silent place, shall hear the slightest sound, such as would be imperceptible to one whose auditory nerves had, for some time, been accustomed to the forcible impressions of the air, made by loudlyounding bodies. This power of accommodation does not only belong to particular senses, but it will bear a more universal application. A person, living a luxurious life, who avoids every sensation which gives him the leaf unease, and who attends only to the gratification of his pleasures, renders his nervous system too sensibl e; he shrinks at the cold wind, he is flattered at a loud noise; and every rough impression, which would not disturb another, owing to his ill-judged indulgence, distresses him. Let us remark the contrast in a hardy seaman, who has induced the inclemency of the weather, who has sustained fatigue and pain: if the winds blow, or the cannon thunder, he bears the one, and feels the other, but they do not much affect him; and from being habituated to sensations, at first paffing, he is afterwards unaffected, even by those impressions which would have a man living in the medium between these two extremes.

It seems also right here to remark, that a great similarity appears to exist between the supposed irritable actions of the nerves, and those of the muscles. The facility, accuracy, and celerity of the actions of nerves are improved by use, as is exemplified in the correct and quick sensations of those persons who are accustomed to exercise their auditory nerves in attending to musical sounds.

A train or succession of nervous actions having taken place, they become concatenated, and are liable to recur in succession, if one of these actions is accidentally induced. Both the nerves and muscles seem to require temporary repose from action, and both appear to be refreshed by sleep.

The supposition of actions occurring in the nerves, explains many circumstances connected with diseases. Vehement actions may be begun independent of impulses in the tangible extremities of nerves, and thus occasion severe pains. This seems to happen in the disease called tic douloureux. Ordinarily, actions begun in the tangible extremities of the nerves, are regularly transmitted to the brain; but in cases of nervous pains, the action seems to begin in the middle of the nerves.

It is also probable, that actions may take place in the semblar extremities of the nerves producing illusive sensations, and thus exciting ideas.

The next subject which claims our attention, is the part of the brain to which all the nervous motions, produced by external impressions, tend, and from which all the motions arising from volition begin. Physiologists have agreed to call this part the sensorium, and have supposed it to be situated in various parts of the brain; but there is no part of the brain to which this importance has been ascribed, which has not been occasionally diseased, without sensation and volition being impaired. Of late, Boullier has affirmed, that he can trace all the nerves to the ventricles of the brain, in which he therefore supposes the faculty of sensation and volition to reside. All our sensations may be gratified at the same time, and we may give a preference to the pleasure which we receive from one of them, above that which we derive from the others; which circumstance seems to prove the unity of that which perceives and determines.

Daller, after considering the subject, thus concludes: "Nunc quilibet in universum observatus, non debere anguliiorem animae sedem ponit, quam fit conjuncta omnium nervorum origo; neque particularis aliqua pro ea fede offerri, nisi ad quam omnes nervos decere possimus. Todicum intelligentia, debere a sensorio communi nullum illius particulas corporis animi senium subiefi, etc. Elench. Physiol.

If it be admitted that sensation and volition exist in the brain, it must also be granted that motions must be produced in the sensorial extremities of the nerves by the objects of sense, and that reflected motions must take place in the nerves, by which the mandates of the will are transmitted to the muscles.

If all that has been said were to be ascertained, the extent of our knowledge would, in that case, only lead to this conclusion, that motions of a subtle substance took place in the sensorium, and from such motions we conceive it impossible to account for sensation. We can conceive no varieties in these motions but those which relate to degree or duration. We feel it impossible to believe that sensation can be the result of such motions, or that ideas can arise from any succession or train of them. We therefore conclude, with many celebrated physiologists, and men of the profoundest understanding and greatest reflection, in the natural belief, that sensation, remembrance, comparison, judgment and volition are properties of a distinct substance.

The conclusion to be drawn from this examination of the functions of the brain and nerves, and from that of the other animal functions, seems curious and interesting. We perceive an exact correspondence in the opinions we obtain from physiological researches, and those which arise from theuggellations of reason, that they have been conformed as intuitive. For most reflecting persons in all ages of the world have believed, and it is, indeed, natural to believe, what modern physiology teaches, that in the human body there exists an assemblage of organs, formed of common inert matter, such as we see in the dead state, a principle of life and motion, and a sentient and rational faculty, all intimately connected, yet each distinct from the other.

Brain, Chemical Analysis Of. Though the analysis of this most important organ can throw no light on its peculiar functions, it is in itself sufficiently remarkable to be detailed somewhat at length.

It is needless to give all the conjectures on the nature of brain, made before chemists had acquired a tolerably accurate and just method of analyzing animal matter. The experiments of real importance are chiefly those of Tourneur, in 1755, with some subsequent additions by Fourcot.
BR At the inner end of it; one of which riveted across the checks or ear, in the upper end of the pump, serves as a fulcrum for the brake, supporting it between the checks. The other bolt connects the extremity of the brake to the pump spear, which draws up the box, or piston charged with the water in the tube. See PUMP.

BRAKEL, in Geography, a town of Germany, in the circle of Welphilau, and bishopric of Paderborn, formerly a city of the empire, 3 miles E. of Paderborn.

BRAKENBURG, Renner, in Biography, a painter of landscapes and conversations, was born at Haren in 1649, and studied first under Mommers, and afterwards, according to Houbraken, under Bernard Schendel. His subjects were like those of Brouwer; and he remembered him, not only in his genius, and style of composition, but in the diffortune of his morals. In some of his pictures, he seems to have been detriment of imitating Ophius. His figures were designed after nature, and represented by the habit and fashion of the times. His subjects were the feuds of towns, the amusements of the villages, dancing, and frequently conversations, in which love and wine were always introduced. His compositions are ingenious, and full of variety; though the forms of his men and women are the same, and selected without elegant taste from nature. His colouring is strong and natural, his touch lively and fine, but he is deficient in taste of design. Pilkington.

BRALIN, in Geography, a town of Silisia, in the principality of Qela; 7 miles E. of Wartenberg.

BRALIO, a mountain in the country of the Gironis, separating the valley of Munster from the country of Bormo, and being a part of the Alps, which is supposed to be the same with that mentioned by Tacitus, under the appellation of "Ioga Rhaetica." The first source of the river Adda lies near the summit of this mountain. Over the Brilio is a road, which, though very indifferent, was formerly the principal passage for the merchant, sent from the Tyrol, through the Valteline, into the Milanese; at present, it is much less frequented.

BRAM, a river of Germany, which runs into the Steer, 10 miles above Itzhoe, in the duchy of Holstein.

BRAM, or Brahna, in Mythology, a pagan deity among the Brahmins in the East Indies. See Bramans.

BRAM in Mythology, a species of Cyprinus, known with us by the name of Bream, and which is distinguished by having the fins brown, and in the anal fin twenty-seven rays. The Bream is found in lakes and rivers, or in the sea. It grows to the length of two, or even almost three feet. The food of this fish is herbs, worms, and smaller fishes. This is esteemed a coarse fish for the table, but to the angler it affords excellent sport. The best time of angling for the Bream is from St. James's day to Bartholomew tide, being then in the highest perfection.

BRAME, in Natural History, a species of Echinorhynchus, that infests the intestines of the Bream. The neck is filiform, and the proboscis armed with very minute prickles. Gez. Oriel.

BRAM, a species of Fasciola, found in the intestines of the Bream and Rickleback. The form is oblong, round, tapering, and obtuse at the base; neck round and somewhat incrassated. Nat. Zool. Dan.

BRAMAGUM, or Brumagum, in Ancient Geography, a town of Italy, in the route from Rauracum to Augulca Praetoria. Antonin. Illn.

BRAMANT, in Geography, a small town of Savoy, in the valley of Maurienne, leant on the river Arc. N. lat. 45°. E. long. 4°. 15'.

BRAMANTE, Lazzaru, in Biography, a famous Italian architect, was born at Castel-du-Sante, in the territory of Urbino, in 1444. His first views were directed to the prosecution of a painter; but architecture being better adapted to his taste and talents, he devoted himself wholly to the assignment of excellence in the art. For this purpose he went to Milan, about the year 1470, and afterwards to Rome, and other cities of Italy, availing himself of instruction from the best masters, and from a diligent examination of the architectural remains of antiquity. At Naples he was employed by cardinal Caraffa in rebuilding the convent of the Pace; and the reputation he thus acquired recommended him to pope Alexander VI., in whose service he executed many designs. Under Julius II. he was employed, as superintendent of his buildings, in accomplishing the grand project of joining the Belvedere with the Vatican, by means of two galleries extended across a valley. In 1504 he accompanied pope Julius to Bologna, and was engaged in fortifying the town; and during the war of Mirandola, he had several opportunities of exercising his talents in the military art. After his return to Rome, he adorned the city with many fine buildings; and at length undertook to demolish the cathedral of St. Peter's, and to supply its place with another edifice suited to the capital of the Christian world. His plan for this purpose was adopted; and before the death of the pope, in 1513, the new structure was advanced as far as the entablature; and at the time of his own death, in 1514, the four great arches for the support of the dome were erected. The original design was abandoned by the architect who succeeded him, not without injury to the structure; but the prosecution of the work was entrusted with Michael Angelo, who praised his plan, and conformed as much as possible to his ideas. Bramante was no less eligible for his general character than for his extraordinary talents as an artist. Obliging in his disposition, he took pleasure in encouraging young persons of the profession; and he invited the celebrated Raphael, who was his confidant to Rome, instructed him in architecture, and procured for him employment in the Vatican. He was also skilled in poetry and music, and composed extemporaneously for his harp. To him is ascribed the invention of confronting arches by casting in wooden moulds a mixture of lime, marble dust, and water, supposed to be a revival of the process of the ancients. His poetical works were printed at Milan, in 1568. The knowledge and practice of the art of engraving may also be added to his other accomplishments. This art he probably acquired at Milan, and his execution of it exactly resembles the style of Andrea Mantegna, that is, with the strokes running from one corner of the plate to the other, without any crooking. He died in 1517. "Tribalbich Strutt.

BRAMBAS, in Botany, a name given by the people of Guinea, and some other parts of Africa, to a peculiar species of lemon-tree. The leaves of this are of a deep green, and of an admirable fragrancy, when rubbed between the hands. The fruit is very small, and has a remarkable thin skin. The juice is used in dying. Phil. Trans. N. 168.

It has not been taken up as a distinct species, either by Linnaeus or any other systematic botanist. In the Abridgment of the Philosophical Transactions it is passed over without notice.

BRAMBER, in Geography, is an ancient borough town of Suffolk, in England. This place, though now reduced to only 25 houses, still possesses the privilege of sending two members to the English imperial parliament, and the borough of Steyning, which unites with this, also returns two members. (See Steyning.) From 1298 to 1472 the rents for clereting burages to serve in parliament were directed jointly
to these two places; but since that period each has been separately reperformed, and each governed by its respective charter. This borough is the joint property of two persons, who, in the year 1726, strongly opposed each other, for the exclusive power of poising the whole. In this struggle, it is flared on authenticated authority, that a tenant of one of the poor cottages had the fortune and integrity to refill the present of 1000l., which was offered for his vote. Here is neither market nor fair, and its whole population only amounts to ninety-one persons. It is 51 miles south from London. History of the Boroughs of Great Britain, 8vo. vol. iii.

BRAMBLY, in Botany, the common English name for the blackberry and dew-berry bushes, Rubus fruticosus and canina.

BRAMBLY, Brambling, Bramble-finch, in Ornithology. See Fringilla montifringilla. Brambling, greater. See Fringilla tephronota. Ray calls the tawny hunting, Emberiza melichira, the brambling or tea bark.

Bramble-galls, in Entomology. See GALLS OF THE BRAMBLE.

Bramble-net, otherwise called bullier, is a net used by bird catchers, of several sizes.

BRAME, Martin Brame of Sonnerat, in Ornithology, Turdus pugilarius, the pageda thrush.

BRAMER, Leonard, in Biography, a Flemish historical painter, was born at Delft in 1590, and acquired the art of painting in the school of Rembrandt, whose manner he imitated. At the age of 18 years, he went to Rome for further improvement, but could never wholly divest himself of the Flemish goit. With a fine taste of design he combined an expression generally good, and occasionally noble. His pencil is delicate, and his colouring very peculiar in the tints, and by great skill in the management of the chiaro-scuro, light, bold, and full of liture, particularly in the vases, which he was fond of introducing, and to which he gave a rich and fine relief. To his pictures he was accustomed to give a great degree of transparency, by painting with a very thin body of colour, especially in the brown and shadowy parts. His name was famous, not only at Rome, but in several other cities of Italy, and his works, out of Italy, are scarce; but when they occur in an undamaged state, they fetch high prices. Among his most capital pictures are the "Rafting of Lazarus," exhibiting a charming contrast of light and shadow; his "Denial of St. Peter," both executed in his best manner, and preferred at Rome; and, particularly, a small picture on copper, representing the "Story of Pyramus and Thisbe." Pilkington.

There is only one known species. Stems, cylindric, tender. Leaves, opposite, oblanceolate, oblong, succulent. Flowers, axillary, fingle, blue. It is a native of moist situations in the East Indies.

BRAMHALL, John, in Biography, an eminent prelate of Ireland, was born at Pontefract in Yorkshire, about the year 1593, and admitted into Sidney college in Cambridge, in 1668, where he took his degree of B. A. in 1612, and that of M. A. in 1616. Having taken orders, he was preferred to a living in the city of York; then to the rectory of Elvington in the same county, and afterwards to the prebends of York and Rippon.

In these several situations he engaged such a degree of felicity and confidence, both by his abilities as a preacher and by his general conduct, that he had very considerable influence in all public transactions. As one of his majesty's high commissioners, to which office he was appointed, he was very affable, and, as some have said, severe in the discharge of his duty. In 1623 he took his degree of B. D. and in 1630 that of D. D. on which latter occasion the subject of his Latin thesis was "The Pope is the Author, or Maintainer of all, or at least, of the chief Controversies in the Christian world," in the support of which he displayed great learning. Soon after he was invited to Ireland by Lord Wentworth, deputy of that kingdom, and Sir Christopher Wardenford, master of the rolls; and in 1633, having resigned all his English prelatures, he removed into that country. From the archdeaconry of Meath, which was his first prelature, he was advanced in the following year to the bishopric of London.

In these situations of dignity and influence he was eminently active and useful in passing several important acts in the parliament of 1634, in reforming the doctrine and discipline of the church, and in the improvement of its revenues. In pursuance of the first of these measures he abolished the fee-farms that were charged on the lands of the church; in accomplishing the second, it was his object to effect a more entire union between the churches of Ireland and of England, and for this purpose he obtained a canonic in the convocation, holden at that time, which expressed an approbation of the 59 articles of the English church, and which denounced excommunication against those who affirmed, that "any of them are in any part superfluous or erroneous;" and with a view to the improvement of the revenues of the church, he adopted various means, which, in the space of four years, gained an accession to them, of 30 or 40,000l. a year. In the conduct and execution of these measures, however, he excited much opposition and obloquy, and he incurred the charge of being inclined to popery and arminianism. In March 1640-41, articles of high treason were exhibited by the house of commons to the house of lords in Ireland against him, and several of the ministers of state, in which they were charged with a conspiracy for subverting the fundamental laws of the kingdom, and for introducing an arbitrary and tyrannical form of government. Instead of securing himself by flight, gratefully to the advice of his friends, he determined to repair to Dublin, and to appear before his enemies in the parliament house, where he was arrested, and from thence conveyed to prison. After a rigorous examination, in the course of which he cleared himself from all filth and sinner views in recovering the patrimony of the church; and when his accusers were proceeding to fix upon him the charge of subverting the laws of his country, he obtained, by the interposition of the primate Usher, then in England, a letter from the king to stop the prosecution of the suit. Accordingly he was set at liberty, though not publicly acquitted. Finding it unsafe to reside at Londonerry, he removed to England; and settled in Yorkshire, where, by his influence and activity, he did great service to the royal cause; but, after the battle of Marston-moor, when the king's affairs became desperate, he embarked with several persons of distinction for Hamburgh, in 1644; and from thence he went to Drabells, where he molly refused, and exercised his ministry till the year 1648.

In that year he visited Ireland, but was soon obliged to withdraw again to the continent; and he remained abroad until the restoration. Upon this event he was recommenced for his loyalty, by being translated, in January 1660, to the archbishopric of Armagh, the primacy and metropolitan see of Ireland. Soon after his promotion he visited his diocese, and by prudence, moderation, and firmness, alloyed the diff

contents
contents that prevailed in it, removed several prejudices that were very generally entertained, both against himself and the church, and gained over many adherents to the cause of conformity. In the parliament of 1661 he was chosen speaker of the house of lords; and as a further evidence of the high estimation in which his character was held, both houses concurred in expunging from their records every charge both against himself and the earl of Strafford. In this parliament he also obtained many substantial advantages for the church. Whilk he was meditating other plans for the benefit of the church and its ministers, he was disabused from prosecuting them by a second stroke of the palsy; and this was succeeded by a third fit which terminated his life, in June 1663. His works were collected and reprinted at Dublin in 1667, in one volume, folio, which was divided into four series or parts. The first contains his discourses against the Roman Catholics; the second consists of various pieces against the English sectaries; the third includes his writings against Mr. Hobbes, which have been deemed very valuable; and the fourth comprehends his controversial writings about the Sabbath and the Lord's day, single sermons, and occasional tracts. Mr. Granger observes, "that Dr. Bramhall was one of the most learned, able, and active prelates of the age in which he lived, an acute disputationist, and an excellent preacher." Although his conduct in the Irish convocation of 1654 be not entitled to any very extravagant applause, and the latter part of the canon, which is said to have been procured by his arguments, be totally inconsistent with a proper respect for free inquiry, or any just sentiments of religious liberty; and although he coincided in many respects with Laud, and more especially in his principles of civil government, he poiseed much greater moderation in religious matters. The temper and prudence, like-wise, with which he conducted his dealings, for the interest of the established church, were far superior. Whilk he approved himself a firm friend to the church of England, he manifested a great degree of charity towards persons of different persuasions; and, accordingly, he distinguished between articles necessary for peace and order, and those that are necessary for salvation; often declaring, "That the church was not to be healed but by general propositions."—Biog. Brit.

BRAMICIDE, the crime of killing a bombing, reputed in the East Indies, one of the five most enormons sins.

BRAMINS. See BRACHMANS.

BRAMNNE, in Geography, a river of Hindostan which runs into the bay of Bengal, 40 miles S. of Balacore.

BRAMPORP. See BURHANPOUR.

BRAMPTON, a market town in Cumberland, England, is situated in a deep and narrow vale, 311 miles N.W. from London. Camden supposes it to have been the Roman Brethureum, "where the Cenoten Armatarum were in garrison on the decline of the Roman empire;" and from its general appearance, it seems to have been of much greater importance than at present. At the east end is a vast conical mound, called the Mot or Castle-hill; which is about 360 feet in perpendicular height, and its acclivity very steep. Near the summit are a trench and rampart, which entirely surround the hill, the crown of which has been formed into a plain, about forty paces in diameter, and defended by a breast-work. Brampton principally consists of one spacious street, irregularly built; but a few modern houset, and a good inn, have lately been erected. Its chief support are a large weekly market (Tuesday), and two annual fairs, for which the grant was obtained in the reign of Henry the Third, by Thomas de Multon, lord of Glland. The houses are 346, and the inhabitants 1682, who are not well employed, there being no manufacture of any extent in the town: it appears, however, to be improving; and a raised waggon-way, which the earl of Carlisle has lately made from his collieries to Tindalefell, will probably conduce to the augmentation of its trade. Religious worship is performed in a chapel, which was consecrated in 1788, having been built with the materials of the church, which stood about a mile from the town, on a bold eminence, near the banks of the river Irthing. The chancel yet remains, and the burial-service is generally read there, most of the inhabitants preferring to be interred in the ground that had entombed their ancestors.

About two miles distant, on the face of a rock overhanging the river Gelt, is the celebrated Roman inscription, noticed by Camden, and almost every antiquary since his time. The rock is of an angular form; and, from its exposed situation, the letters have been partially obliterated, but let us so than could have been expected from the forms of fifteen centuries.

Near the junction of the rivers Irthing and Gelt is Edmond-Castle, the seat of Thomas Graham, esq., beautifully situated; but greatly improved by the plantations, and other tasteful and judicious alterations of the present proprietor. Near this manston, on a rising ground, is a mound of earth, called Castle-Hill, raised about twelve feet from the adjacent land, hollow on the top, and upwards of thirty yards in diameter. Between one and two miles north-west from Edmond Castle, is Watchcros, the fourteenth station ad lineam Valli, and supposed to have been the Aberlashe of the Notitia. It is situated on the summit of an eminence, of an easy ascent, and commanding a very extensive prospect. On the south side are several irregular lines and breast-works, and the site of the Praetorium is still distinct. The military way, which generally accompanied the Pretentier, runs in this part of the county at some distance, in order to avoid the marshes and bogs through which both the walls of Severus and Hadrian were carried. Its comparative direction, therefore, from Carr-voran to Stanwix, is that of a firing to a bow; and hence it passes this station, which is several hundred yards south of the wall.

BRAMSCH, a town of Germany, in the circle of Welsphalia, and bishopric of Osnabrook, on the Hafe; 5 miles S. W. of Vorden.—Also, a town in the circle of Welsphalia, and county of Lingen; 5 miles S. S.E. of Lingen.

BRAMSTEDT, or BRAHMSTED, a town of Germany, in the circle of Lower Saxony, and duchy of Holstein, situated on the river Bram, and having near it a medicinal spring discovered in 1681; 21 miles N. of Hamburg.

BRAN, the skins or husks of corn, especially wheat, ground, separated from the farina or flour, by a sieve or boulter.

Of wheat bran it is that flatch-makers make their flatch, which is nothing else but the facula remaining at the bottom of the vesseis, wherein the bran has been steeped in water. Bran is held deterrent, and, on that account, is of some medicinal use in gargarisms and glyceters. It is also a chief ingredient in the composition of cataplams. Some apply it hot against the pleurisy; boiled, it purges scurf and dandriff, and cleanses the hands in lieu of soap. Among the ancients, it was also used as an erotic, to excite love.

Bran has been given to horses; but it has been observed that those of bakers and mealmen, which have principally been fined on this article, with the addition of a few split beans or peas, have become pufive and thick-winded, then athmatic, and lalily, dull, heavy, and inactive. And when they have died at 5 or 10 years old, a large ball, or mealy concretion, of different sizes in different subjects, has been found
found in the stomach and intestines, hard, and about 10 or 12 pounds in weight. However, bran, though an improper food for horses in its dry state, is an useful
ingredient in maltes with meal, and serves to prevent the fattening richfeeds of that article alone; and also in common
maltes with oats, when a horse is under a course of phytic:
and with a proper impregnation of honey in the malths for
colds, during the severity of the winter season. Taplin.

Dyers rank bran in the number of non-colouring drugs; 
because it yields no colour of itself. It serves for the making
of their four waters, used in preparing fluffs to take the dye.
This water is made by boiling wheat bran, and into the
decocion putting a little leaven.

BRANA, in Ancient Geography, a town of Spain, in
Bactica. Pliny.

BRANAW, in Geography, a town of Bohemia, in the
circle of Koniggratz, in which is a manufacture of coloured
cloth; 11 miles N. W. of Glatz, and 29 N. E. of Ko-

BRANCA Ursina Germanica, J. Baul. See Heracleum
Spontaneum.

BRANCA, in Geography, a small island in the Atlantic,
being one of the Cape de Verde islands, near the coast of Benin,
in Africa.

BRANCA, in Middle Age Writers, the paw, or extreme part
of the foot of a wild beaft, or bird of prey. Du-
Cange.

BRANCA, or Branchia, also denotes a right of lopping
or cutting off branches of trees in the forest for firing. Du-
Cange.

BRANCALEO, John Francis, in Biography, a Ne-

copolitan physician, published, in 1534, De balneas, quam
falubria sint, tum ad sanitatem tuaemdam, tum ad morbos
He defends bathing against the objections of his contemporaries,
in the authority of Galen, and from his own experience
recommends the practice in intermitting fevers, and as
an affilliant in the cure of the ews veneres. He reproves
his brethren for their too frequent ufe of purgative medicines,
the common recourse, at that time, against moft diseases.
The work has been several times reprinted. Haller Bib.

BRANCALEONE, in Geography, a town of Italy, in
the kindom of Neples, and province of Calabria Ultra; 9
miles S. E. of Bova.

BRANCAS, 4. a town of France, in the department
of the Indre and Loire; 4 leagues S. of Tours.

BRANCH, in Botany. Branches are the divisions of a
stem or trunk, which are found on many herbaceous plants,
but are chiefly noticed on shrubs and trees. The primary
branches spring immediately from the trunk; the secondary
ones from the primary; and so on in a regular subordina-
tion, till they terminate in slender twigs. They confit of
precisely the fame anatomical parts as the trunk, and with
the exception of a root, are in fact little trees, which if
separated from their parent flock, and planted in the earth
under favourable circumstances, would throw out roots, and
become independent plants. They proceed from buds formed
within the surface of the trunk which interrupt the paral-
lelism of its fibres, and form knots in the wood. These
knots afford a point of support, and centre of motion to the
growing branches, and are funk more deeply in the wood in
proportion to their age.

The lower branches are often nearly parallel to the hori-
zon at right angles with the trunk; those above them make
angles more and more acute, as they are placed nearer the
summit; but these angles differ in different species, and in
every individual tree are subject to numerous varieties, from
the influence of external causes. Some branches produce
only leaf, and new branch buds; others produce only flower
buds. The former are smooth in their surface, pliable and
tough, with clofe straight fibres, catly separable from each
other: the latter are wrinkled at their bark, have their fibres
less compact, and break short when trunck. There are also
branches which pierce the bark without a bud, and form
what is commonly called false wood. These, as they are
often luxuriant in their growth, and rob the more useful
branches of their due nourishment, are carefully pruned
away by the skillful planter and horticulturist. They have a
rough bark, and produce only a few blackish buds.

BRANCH, in Vegetable Anatomy. Almost every plant
or tree, when arrived at a certain period of its growth, ex-
hibits at its superior part, more or less of a divided or rami-
fied appearance. The mode of increase by means of branches
has been observed to generally amongst vegetables,
that it was formerly considered the exclusive distinction of
that class of beings; but it is now well known that a nu-
merous tribe of animals multiply themselves by branches,
and therefore this mode of propagation is not quite peculiar
to the vegetable kingdom.

On a superficial inspection, the branches appear as so many
divisions and sub-divisions of the tree, in the formation of
which the main trunk is disposed of or expended; but a
more accurate examination proves, that the trunk loses none
of its substance in the production of the branches; that both
trunk and branches take their origin, and continue to in-
crease precisely in the same manner; that, in fact, every
branch should be considered as a lesser trunk, differing only
from the parent item, in the circumstance of not deriving its
fuitance immediately from the earth.

The branches are the product of the buds in which they
enjoy, for a certain period, a species of vital existence, as
the embrio of the trunk did originally in the seed. See the
articles Seed, Fruit, Trunk, Bud, and Bulb.

The kind of attachment which continues to subsist be-
tween the trunk and the branches affords additional proof
of the individuality of the existence of the latter; although
the external form of a tree would lead to the supposition,
that the branches were formed by different detachments of the
facciculi composing the original trunk, in the same manner
as one separates into several portions the fibres of a rope;
yet, to ehibit the contrary, it is only necessary to make
some fections of the branches where they are implanted into
the trunk. Thus, suppose a tree, which divides into two
primary branches, he cut tranversebly about a foot above
the bifuration, the fection will be found to represent that of
two different trunks, each composed of concentric circles of
woody fibres. (See Plate II. in Vegetable Anatomy, fig. 1.)
If a tranverse fection be then made of the same branches,
at the place where they first appear to separate from the
trunk, the concentric layers corresponding to each branch
will be perceived as before, but they will be found sur-
rounded by several circles of the woody layers belonging to
the trunk. (See Plate II. in Vegetable Anatomy, fig. 2.)
If a tranverse fection be again made similar to the last, but
a few inches lower down, the circles of woody layers which
compoze the branches will be seen diminished in number and
size, while the concentric layers of the trunk have become
in the same proportion more numerous. (See Plate II. in
Vegetable Anatomy, fig. 3.) If, lastly, similar fections to
these described be repeated at short distances from each other,
it will be found, that the number of woody circles which
appertain
appears to the branches, continue regularly to decline, in proportion as the fections are performed lower upon the tree, until they disappear altogether, there being at last exhibited only the appearance of the divided circles of the layers of wood, which constitute the main trunk. The connexion of the branches with the trunk is, therefore, by means of a cone, of which the apex is directed towards the centre of the tree, and the base corresponds with the superficial.-Fig. 4. of Plate II. in Vegetable Anatomy, represents the arrangement of the ligneous fibres, by means of which the origin of the branches is rendered of a conoid form.

When a branch is forcibly torn from the stem, it is commonly observed to bring with it a portion of a cone or pyramid, which leaves a corresponding depression at the part from whence the branch has been removed. This arises from the wood fibres being most easily ruptured, where they are reflected into the angle, which forms the line of junction between the branch and the trunk.

The small or secondary branches have precisely the same kind of origin and connexion with respect to the large or primary branches, which these latter have with regard to the trunk. Hence every branch may be considered as a parent stem sustaining others, which in their turn give origin to new branches, and these again to others, as long as the vegetable continues to grow.

Branches acquire bulk by the addition of successive layers of wood, in the same manner as the trunk. See fig. 5. of Plate II. in Vegetable Anatomy, which is copied from the design of Duhamel, to illustrate the growth of branches. The entire figure is supposed to represent a tree of four years of age, furnished with several branches in the order in which they might naturally occur. The wood cone, \( N^\circ 1 \), having developed a bud towards \( a, b \), a branch would exist in the fourth year composed of four layers of wood, as represented by \( a, b \).

If another bud were formed upon the ligneous layer of the second year, \( N^\circ 2, 2 \), its branch in the fourth year would be composed of three layers, as seen in \( c, d \). Admitting further, that in the third year a bud was produced from the branch \( a, b \) towards \( f \), a little branch would be formed which could only have two layers; and lastly, if in the fourth year, when the ligneous layer \( N^\circ 4, 4 \), is deposited, another bud were to grow towards \( g \), the branch to which it would give origin would be made of only one layer of outer fibres, as shown by \( g, b \). Thus, the number of wood layers which compose any branch being ascertained, its age becomes known, and the relation which this bears to the age of the parent trunk is discovered by finding the wood layer upon which the apex of the ligneous cone of the branch is implanted; or, in other words, observing the point where the parallelism of the longitudinal fibres of the trunk is first interrupted.

It is asserted by Parent, "Histoire de l'Académie," 1711, that the branches are nourished by the pith or medulla, but nothing can be more erroneous; the medulla of the branch does not even communicate with that of the trunk, although the ligneous cone of the branch is most frequently implanted upon the innermost layer of the wood fibres, or those which immediately incafe the medulla.

Du Hamel has remarked, that the longitudinal fibres, whether woody or cortical, take the direction of the chief current of the sap; thus, if the sap be propelled in the direction of the trunk, as happens when either the branches have been originally inconsiderable, or have been early lopped off, the cortical and woody fibres proceed nearly a perpendicular position, only separating to give passage to the branches and immediately after recovering their parallelism. See Plate II. in Vegetable Anatomy. Fig. 6. exhibits a portion of a thick trunk, from the side of which had proceeded a small branch. If a large branch arises from a trunk, it necessarily attains a great portion of the sap, and, in this case, the inclinations of the cortical and woody fibres is obliquely towards that branch, as it is represented by fig. 7. of Plate II., in Vegetable Anatomy. This effect is still more remarkable in trees, which have been tipped immediately above the origin of a young branch; for then all the sap being obliged to pass towards the branch, the fibres pursue the same direction, and hence, if a tree be examined in the spring, after having been thus deprived of its top the preceding winter, the new ligneous fibres will be observed to cross the others, as appears in fig. 8. of Plate II., in Vegetable Anatomy.

The course of the ligneous fibres determines the nature and quality of what is called the "grain" of wood. In proportion as the fibres preserve the parallel direction the grain is smooth and equal, and the wood tractable in the hands of the workman, and accordingly those trees which furnish but few or small branches, such as the different firs, are most used in carpentry: whilst mahogany and several fruit trees are preferred for making furniture, on account of the various disposition of the fibres, and the number of large knots, which produce the beautiful diversity of colours observed in these woods.

The branches occasion that appearance in wood, known by the name of a "knot": the longitudinal fibres being diverted from their course, and subjected to compression, at first by the eruption of the bud, and afterwards by the growth of the branch, acquire a degree of solidity and compactness unlike any other part of the vegetable body. The ligneous cone of the branch itself generally acquires more or less of the knotty texture; the conversion of the origin of the branch into a knot is influenced however by several accidental circumstances, the habit of the tree, &c., which are pointed out in another place. See Knot.

The branches of the vegetables with one seminal leaf differ from the dicotyledons in this particular, that they are not produced by buds, but by the longitudinal fibres turning aside, and prolonging themselves in a diagonal course, until they penetrate the bark.

After the description which has been given of the origin and growth of the branches, it is almost unnecessary to add, that they puffeff the same anatomical structure as the trunk; all the parts which compose the one are met with in the other, and are disposed with perfect similarity in each, as the epidermis, the parenchyma, the cortical layers, the wood, and the medulla.

The form of the larger branches is most frequently cylindrical, but the slender ones have several forks, or exhibit in the transverse section more or less of a polygon figure. The section of the branches of the elder and the orange-tree is triangular, that of the Virginia poplar is square, and in the plum-tree and willow it is pentagonal.

The general appearance of a vegetable, which botanists have termed the "habitus," depends chiefly upon the position which the branches and their ramifications obtain with respect to each other, and the different directions they assume. The branches like the leaves arise in various orders: sometimes they are opposed to each other, as in the hazel, oak, and coffee trees; at other times they succeed one another alternately, as in the pear and apple trees, &c. They are arranged in a circle round the stem in the protea argentea: in some instances the branches are widely scattered on the tree, while in others, they are so thickly set, that they conceal from view the trunk and one another. The various situations of the branches depend upon that of the buds from
from whom they originate; and being constant in each species, more particularly with regard to the secondary branches, it furnishes a botanical character, of which Adanson has taken advantage. The branches, as well as the leaves, are strongly attracted by the light; they avoid even the shade caused by the foliage of the adjoining branches of the same tree, and hence it is, that those which are next the ground extend in a horizontal direction, in order to escape from the shadow of the superior branches, and that the latter, in proportion as they approach the summit of the tree, assume more of an erect position. The latter ramifications observe a similar position. The economy of some trees renders the direction of their branches somewhat peculiar, thus, in the pohon, they are nearly vertical, whilst in the aspen they lie towards the earth, and in the fig-tree they are curved towards the root; but in these instances also the lowest branches are still the most prominent, in order that all may be equally and fairly exposed to the light.

Du Hamel has made a number of experiments, to determine the proportionate thickness of the trunk to the primary branches, and again of these to the secondary branches: his experiments tend to prove, that the squares of the circumferences of the first branches exceed those of the trunk, in the proportion of 5 to 4; and in comparing the squares of the circumferences of the primary and secondary branches, he found that the latter fell short of the others in the proportion of 100 to 101 in one instance, and in another of nearly 50 to 51: the primary branches, therefore, not only exceed in quantity the trunk, but those of the second order also, which are nevertheless so much more numerous. Du Hamel explains this curious circumstance, by supposing that the smaller branches are most liable to be defoliated, in which case they would not only suffer diminution themselves, but their leaves would tend to make those from which they spring more vigorous, and consequently larger.

The Abbe Schabol distinguishes in fruit trees five sorts of branches: the first kind are smooth on the surface, their fibres are straight and closely applied to each other, but easily separated; they are pliant, and break with difficulty; it is upon these branches the wood buds are found. The second sort fall from the fruits; they are wrinkled at their base; their fibres appear to be more interwoven; they are supplied to be endowed with numerous veins and pores; they contain a thick sap; and when bent are readily broken. The third kind of branches resemble those which become the wood, but are not produced from buds; they arise from the bark, and, as they never become hard, they are called the branches with false wood. The fourth sort are very broad at their base; their bark is brown and rough; their buds are black and not numerous; these branches, like the leaf, are produced by the bark; they grow rapidly and soon perish; they are injurious to the tree, in depriving more useful branches of their due proportion of nourishment. The fifth sort are small branches which abound upon unhealthy trees; they exhaust the fibres, and are useless upon the most vigorous; they die before they acquire any magnitude.

There is a remarkable relation between the branches and the roots; upon these parts mutually depend the ascent and descent of the sap; they must, therefore, act in harmony and in proportion to each other: hence, if a tree be deprived of some of the principal branches, the corresponding roots perish; or, if the small branches be clipped to form the tree into any particular shape, the roots gradually assume the same figure; if the summit of the trunk be cut off, the lateral branches become more vigorous; in the same manner the lateral roots acquire strength, by the removal of the extremity of the principal root. The fine fibres of the root perish at the fall of the leaf; and mildly, experiment has shown, that the tops of the branches, when covered with the earth, will produce roots; and that the roots, when exposed to the air, will put forth leaves.

Branch, in Mythology. Anciently branches were carried in the hands of the procumens and ceremonies of the gods; whence the thaliphori, or branch bearers. The Thelipans adored a branch. 'The olive branch was the symbol or ensign of peace. The natives of the islands of the South Seas the green boughs, &c. for the same purpose at this day.

Branch is also applied to the parts or ramifications of diverse other bodies, which, in respect hereof, are qualified as items. Thus chemists speak of the branches of their metallic vegetation, branches of the arbor Diane, arbor Martius, &c. Phil. Trans. No. 286. Mem. Acad. Sc. 1692. 1702.

Branch, in Anatomy, denotes a division of a vein, artery, or nerve. All the veins in the body are only branches of the vena cava.

Branch is also used in the Military Art, in speaking of trenches, mines, and their several ducts, ways, returns, and the like, between one well and another. See Gallery.

Branch is also used in speaking of the veins of mines of gold, silver, or other metals, which divide like the veins in the body.

Branch, in Genealogy, is applied to the several lines or issue arising out of the same stock or origin. In which sense, branches amount to much the same with cadets.

Branch also denotes a complex metallic kind of candlestick, contrived for the reception of a number of candles. These, in ancient writers, are called paria, cantares, sijfe; when made of glass, lyitra; the richest sort, girandole.

Branch of the branches, in Fortification. See Boyau.

Branch-land, in Falconry, signifies to make a hawk leap from tree to tree, till the dog springs the partridge.

Branch, in Scripture, is an appellation peculiarly given to the Mediah, as being of the branch or house of David.

Branches of vases, are sometimes used to denote the arches of them.

Branches of arches, denote several portions of arches springing all from the same summer.

Branches of ogives, in Architecture, the reims or arches of Gothic vaults; which traversing from one angle to another, diagonal-wise, form a crois between the other arches which make the sides of the square, whereof those arches are diagonals.

Branches of a turret, in the Mange, are two crooked pieces of iron which support the mouth-bit, the chain, and the curb; and which are fastened on one side to the headstall, on the other to the reins; serving to keep the horse's head under command.

What way ever the branches of the bit incline, the horse's mouth goes to the contrary. The Duke of Newcasttle is very particular on the head of branches; explaining their several kinds and their effects, which are reducible to those of a lever. The branch is always to be accommodated to the design, either of bringing in, or raising a horse's head, and to the necessary degree: accordingly, we have strong and hardy branches, gentle branches, rude branches, &c.

With regard to their form and structure, branches are either flat, in form of a fist, for young horses to form their mouth; or, after the contabile of France's fashion, for horses that already carry the head well: others are in form of a gigot,
The branch, which is native to Greece, is diminutive in the moment of the new-born, diminishing as it is grown, yet acquiring a certain magnitude. A thick and sturdy branch is that whose leaf-hole, at the lower end of it, is placed on the outside of the line of the branch. A gentle branch is that, the leaf-hole of which is set on the inside of the said line. A rude and hardy branch will bring in a horse's head, proportionately as it is more or less hardy; whereas a gentle branch, by diminishing the effect of the bit-mouth, makes a horse more easily bear the pressure thereof, who before could hardly endure it. See Bits.

**BRANCH** or **BREATH**. See VELVET.

**BRANCH** or **BREATH**, among Poets and Falconers, denotes a young bird well fledged, which, having quitted the nest, is not yet in a condition to fly far, or shift for itself, but still keeps in the bushes or branches about its native dwelling, where it is fed by the dam.

The branches of hawks are also called ramage falcons; those of nightingales, 

The branchery, in the Anatomy of Vegetables, denotes the vascular parts of divers fruits, as apples, pears, plums, and berries. In which nature the branchery stands contrariwise distinguished from the skin, pulp, &c.

The branchery of an apple is only the ramifications of the ligneous body through all the parts of the parenchyma; the greater branches being likewise, by the incisions of the leffer, united together. 

**BRANCHIA**. See GILLS.

**BRANCHIADAE**, in Ancient Geography, a people who are placed by Quintus Curtius towards the Oxus, and by Strabo in Sagitania, the adjacent country.

**BRANCHIALE**, in Natural History, a name given by 

Mr. Llwyd to a peculiar species of fungite, which being of a deeply filivated texture, is supposed to resemble the gills of a fish.

**BRANCHIADAE**, in Antiquity, priests of Apollo serving in his temple at Delphi, near Miletus; which was famous for its oracle. The temple of the Branchiades, or, as it was afterwards called, of Apollo Didymæus, together with the oracle, were seated on the mountain called Poldenum, at the distance of 20 or 22 stadia from the shore, and 100 from the city of Miletus; and both are recited as occupying this spot before the Ionic migration. The appellation "Branchiades," was derived from a very noted family, so called, which continued in possess-ion of the priesthood till the time of Xerxes, deducing its pedigree from the real or reputed founder, and original proprietor, "Branchus." Several of these sacred tribes flourished in Greece, and intermixed, as the Branchiades did, fable with their genealogy; and with a view of conciliating from the people a greater respect for their progenitor, ranked him far above the level of common humanity. The story of the Branchiades is so ridiculous to be recited; and we shall, therefore, refer for the relation of it to Varro. By some, however, this name is derived from Branchus, a Thessalian youth, beloved by Apollo, who received him into his own temple, and commanded that divine honours should be rendered him after his death. Stephanus Byzantinus informs us, that this oracle was sacred to Jupiter, as well as to Apollo; and probably both these deities, as well as Branchus, were honoured in this temple. Whatever be the origin of the oracle, it is certain, that it had acquired a very early and extensive reputation at Branchida; and it was particularly consulted by Chrysippus, who was profusely munificent upon these occasions, dedicating his choice treasures to a vast amount, in the same manner as at Delphi.

The Persians, under Xerxes, the son of Darius, afterwards despoiled this temple and oracle of all their wealth, and then destroyed it by fire. The Branchiades, who had betrayed this temple and oracle into the hands of the Persians, became, on the miscarriage of Xerxes the voluntary companions of his flight, in order to avoid the punishment of their treachery and sacrilege, and settled among the Bactrians, in a region far removed from Greece. However, the descendants of those who had fled with Xerxes, were cruelly extirpated by Alexander the Great; thus visiting the sins of the fathers on the children, in a manner which will for ever reflect the greatest odium on the memory of the perfidious tyrant, who, after receiving the submission, put them all to the sword, and erased even the velleities of their towns: so that the city remained a bare silhouette and barren walk.

Although the Milicians were too much impoverished and deprived to attempt an immediate restoration of their temple, after the conclusion of the Persian war, they exerted themselves at a subsequent period, not precipitately, in rearing the fabric from its ruins; and the architects employed by them for this purpose, were Poesius, an Ephesian, and Daphnis, of Miletus. With what magnificence and prodigious spirit this new edifice was designed, may in some measure be inferred from its present remains. Strabo has termed it, "The greatest of all temples:" adding, that it continued without a roof, on account of its magnitude. Pausanias mentions it as one of the wonders peculiar to Ionia; and Vitruvius numbers this among the four temples which had raised their architects to the summits of renown. In this city was the famous statue of Apollo, formed by Canthius, a Sicelian, who had been a scholar of Polyeuctus the Argive; it was carried away by Xerxes, and restored by Seleucus Nicator. It is said, that the oracle of this Milician temple became silent, when it was defaced by the Branchiades, and that it afterwards refumed its prophetic and oracle faculties. After Paganini began to decline, this oracle continued in some repute, and the emperor Julian was very solicitous to reinstate the god in the full possession of his Ionian territory; which, however, he was constrained to yield up to Chaldaian, soon after the death of the royal apollate. Strabo, Geoj. tom. ii. p. 517—634—814. Pausanias, Græc. Descrip. p. 355. 694 ed. Kühni. Ionian Antiquities, by Chandle. Keewett and Pars. 1769.

**BRANCHIER, Sr.** in Geography, a town of Switzerland in the Valais, seated near the river Drance. N. lat. 46° 5′. E. long. 7° 3′.

**BRANCHING**, the ramifications or sprouting of the horns of deer, &c. which bears an analogy to the vegetation of plants. Phil. Trans. No. 227.

The hair at the ends is apt to branch, or split and divide into whole branches, which are easily visible by a microscope.

**BRANCHIOPODA**, in Entomology, a genus of crustaceous insects established by late continental naturalists to include those species of the Linnaean cancri, and gammarus of Fabricius, which have four simple, fetaeous, unequal antennæ; the body oblong, and dilidute of feet, but in lieu
of which each side is furnished with either a single, or a double series of obovate, ciliate, branchioidous appendages, which are formed for swimming; and the tail naked, jointed, long, and forked at the extremity.

The two species of this new genus, described by Herbert, Duchoine, and Dole, are le branchipode flagellum, which is cancer flagellus of Linnaeus, and a second form delineated by Herbert, called le branchipode palладiwm.

BRANCHIOSTEGA, in Zoology, a kind of cory-phemata, having for the aperture of the gills a transverse cleft, or opening. It inhabits the Atlantic seas.

BRANCHIOSTEGI, in Ichthyology, a term employed for that natural order of fishes which have gills deflected by bony rays. The genera branchioidous fishes are: mormyrus, obturans, tetron, dionys, fungu, pegasus, centu, ligu, cyclo, and liphis.

BRANCHUS, in Medicine. The heart of which accompanies a cataract is so called from ἐβδομάδα, to be moist. See CATARRH.

BRANCHUS, or branchus, also denotes a kind of glandular tumor in the fæces, resembling two almonds, which render the breathing and hawking difficult.

BRANCTION, in Geography, a small town of France, in the department of the Saone et Loire, 1½ league W. of Tournus.

BRANCO, an island in the gulf of Mexico, and bay of Campasch, between cape Condeco, or point Delgado, and Vera Cruz.

BRANCOVAN, a town of European Turkey, in the province of Walachia; 28 miles N. of Nicopolis.

BRANCOURT, a town of France, in the department of the Aine; 10 miles W. of Lomn.

BRANCZYCE, a town of Lithuania, in the province of Novogrod; 10 miles N. of Sluck.

BRAND, in Agriculture, the name of a disease to which corn, and some other grains, are subject. "It is a sort of fungus, which derives its nourishment from the vegetable. Of these fungi, there are several species. One of them is named by Dr. Withering (Bot. Arrang. vol. iv. p. 338) "Reticularia S-quetum," and in a pamphlet upon Brand, by the Rev. Henry Bryant, entitled, "A particular inquiry into the causes of that disease in wheat commonly called Brand; &c." Norwich, 1785, it is called "Dust Brand." In other places its usual name is "Smut," or "Burnt Corn." This species is common to wheat, oats, barley, and rye. The feel of the husks, and other grains, are also affected by it. It is distinctive of scent, and confounds not only the fumaceous part of the grain, but even the ear and chaff, dispersing itself entirely before the corn is cut; so that the injury occasioned by it is confined to the quantity of grain destroyed by it, which is not very great in any field. The ear is often affected by this reticularia before it emerges from the scutum vaginum, or hofe; but about the root there is no appearance of disease. Barley and oats are more frequently attacked by it than wheat; which circumstance may be accounted for by the latter being usually dusted for sowing. Mr. Lathbury examined the dust of this fungus under a powerful magnifier, and thus found, that it consisted of a number of minute particles, uniform in shape and size, much smaller and blacker than those of the "pepper brand," and less easily separable, and they seemed to be contained in little irregular cells. This dust, or seed, is the food of a small, thin-winged, black dermestes, the "Tenebres ster," of Marham. Another species which Mr. Bryant distinguished by the name of "pepper brand," is also called simply "brand," or "bladders." This species does not eat through the scutum, containing only the fumaceous part of the grain. The ears affected by it are easily discovered by their external aspect; for the chaff opens as if unnaturally inflated, the germ becomes shorter and rounder, and exhibits the appearance of swelling, and a sort of inflammation; the grain turning in this state a deep and dingy hue, easily broken when rubbed, and furnishing a foamy powder, which fills the fingers, and emits a very fetid scent. This species is very prejudicial to the farmers; because it is carried with the corn into the barn, and when broken under the flail it diffuses and otherwise injures the sample, to no end to render it unsalable, or to reduce its price. For the prevention of this evil, farmers generally drain their seed-wheat with various preparations: some use a licentious of wood-salts and water; others, sift and water only, or sea-water; when it can be easily procured; others, the bony from the soap-bottles; others, again, urine and cheese-whey; and others, it is laid, have infested arsenic for this purpose. All, as Mr. Kirby believes, dry their feed with fresh backed line. From this practice we may infer, that the disease is supposed to originate from the adhesion of the dust or seed of the brand to the seed of the wheat; and these methods are adopted for the purpose of washing it off, or destroying it. The ultimate cause of this disease has not been variously ascribed. Mr. Bryant (ubi supra) strenuously maintains, that it is occasioned by an injury which the anthraco, receive by too great contrivances, when the ear emerges from the sulcum vaginum; and the car discharges the common practice of dressing the feed, as not only useless, but detriutive of the grain. Some take the dust for the eggs of insects; and others adopt the opinion, with which Mr. Kirby coincides, that this evil is occasioned by a minute vegetable of the order of "Fungi." Mr. Bryant's method of accounting for this disorder is acknowledged by this ingenious naturalist to be plausible; but he conceives that it is founded on no arguments which can convince one who is in search not of theories, but of truth. From a variety of experiments made by the Rev. Peter Lathbury, E.L.S., and recited by Mr. Kirby, (ubi infra) together with other facts that occurred within his own knowledge, he concludes, without hesitation, that the practice of dressing the feed previous to sowing, in the way above-mentioned, is a very judicious prevention of the brand.

Rejecting Mr. Bryant's hypothesis, and also that of the brand's being produced by insects, Mr. Kirby proceeds to establish the third opinion, that the disorder is occasioned by a vegetable substance. The fact, established by the experiments which he recites, that the dust of brand, carried into the field with the seed-wheat, like other vegetables, propagates itself, gives (he says) the highest degree of probability to this opinion. It is further confirmed by the recital of an experiment of Mr. Lathbury, of sowing it, as it were, upon its native soil (especially in the case of wheat taken from a clean sample), which seems to have occasioned the destruction of three-fourths of its produce. Besides, this dust, when placed under a powerful magnifier, exhibits every appearance of minute feed. As to the manner in which these feeds vegetate and ascend from the seed with the growing plant, till they reach the heart of the grain, it is a subject of inquiry that may be extended to a great number of the fungi, which without impropriety may be denominated "fumaceous" vegetables. With regard to the brand in particular, it is fogged, as a probable conjecture, that the uncommonly minute feeds of this fungus may attach themselves either to the "plumula," and to paths through the air-vesels into the plant; or else to the "cotyledons," which seems most likely; and in that case they may be propelled through the sap-vesels with the sap.
BRA

till they at length arrive at their final seat, the heart of the germs. See observations upon certain fungi, which are
parasites of the wheat, by the Rev. William Kirby, F. L. S.
in the Linnean Transactions, vol. i. page 112. &c.

BRAND, in Geography, a town of Germany, in the circle of
Erzgebirg, chiefly inhabited by miners; 2 miles S. of
Trebey.

BRANDSUND, Dimanche des Brandons, in French
Ecclesiastical Writers, denotes the first Sunday in Lent; which
is thus called on account of an ancient practice in the Lin-
nois, where the peatants, in the night of this day, walked
about their orchards, garden, &c. with torches lighted, or
fire-brands in their hands; in which plight they visited every
tree, and addressing themselves to them one after another,
threatened that if they did not bear fruit well the ensuing
feast, they should be cut down to the ground and burned.
This is evidently a relic of paganism; the like of which was
practiced by the ancient idolaters in the month of February;

BRANDAN, in Geography, a town of the East Indies,
in the island of Java, belonging to the king of Sourahaya.

BRANDANO, a river of Italy, which runs into the gulf
of Tarento, 10 miles S. of Castellanetta, in the kingdom of
Naples.

BRANDARIS, in Conchology, a sort of Murex, com-
mon in the Mediterranean and Adriatic sea. The shell is
somewhat ovate, and surrounded with straight spirals; bears
moderately subulate, slight, and obliquely surrounded
with spines. Gmelin, &c.

Many varieties of this shell are described by writers; gen-
erally the colour is white, whitish, cincereous, or brown, with
126.

BRANDELIS, in Geography, a town of Bohemia, in
the circle of Koniggratz, leant on the river Orlist; 21 miles
S.E. of Koniggratz.

BRANDEL, PETER, in Biography, a painter of por-
trait and history, was born at Prague, in 1660; and having
spent about four years in the school of John Schroeter,
principal painter at that court, a kind of jealousy of his rifing
merit was excited in the mind of his master, so that Brandel
resisted the ill-treatment. He removed from him; and at
the age of about 19 years, quitted his school, and com-
menced a master himself. Moll of the churches at Prague
and Breilau are embellished with his works; and the prince
of Hatzfeld is said to have given 100 ducats for one picture
of St. Jerome at half length. He spent most of his time at

BRANDENBURG, MARK, or MARQUISATE OF,
a country of Germany, bounded on the north by Mecklenburg
and Pomerania, on the east by Poland, on the west by the
duchies of Magdeburg and Lueneburg, and on the south by
Silesia, the Lusatias, the electorate of Saxony, the prin-
chappy of Anhalt, and part of the duchy of Magdeburg.
its greatest extent from west to east is about 200 miles, and
from north to south about 110 miles. The country is gene-

ually level, and the soil sandy and barren, but by the indus-
try of the inhabitants rendered productive of several sorts of
grain. They find, however, that the only very profitable
crop upon these lands is buck-wheat, which they sow in
large quantities, and which yields a product equal to that of
the bell foils applied to that grain. When a piece of land
has been managed with greater care than ordinary, it will
yield a good crop of rye; but wheat and barley are rarely
to be seen. In some parts the inhabitants cultivate millet
and flax; in other parts, potatoes and turnips; and again in
others, tobacco and wood for dyeing. By various improve-
ments of modern times, the waffle lands and the large mor-
ingue, which have been drained, have become fertile. From
their woods they derive an ample supply of fuel for their do-

cotomical life, and for their glass and iron furnaces, charcoal,
tar, wood-ashes, and large quantities of timber for house
and ship-building, part of which is exported to Hamburg,

cotomical life, and for their glass and iron furnaces, charcoal,
tar, wood-ashes, and large quantities of timber for house
and ship-building, part of which is exported to Hamburg,
Mark is again subdivided into the Old Mark, the Vor-Mark, or Mark of Prignitz, the Middle Mark, and the Ucker Mark.

The Old Mark, extending from east to west about 9 German miles, and from north to south about 11 miles, is separated, towards the east, by the Elbe from the Prignitz and the duchy of Magdeburg, and bounded also by the latter to the south and likewise, in part, to the west, but in other parts by the duchy of Lauenburg. It contains 13 cities, of which the capital is Stendal. Its taxable lands are 80,578 hides.

The Vor-Mark, or Prignitz, is terminated by the Elbe and Havel, the duchy of Mecklenburg, and the circles of Ruppin and Havelland in the Middle Mark, and is 10¼ German miles in length, and ⅔ in breadth. It contains 20 towns, the principal of which is Perleberg. The hides of land that pay taxes are 5,211.

The Middle Mark is bounded by the Prignitz, the duchies of Magdeburg, and the electorate of Saxony, the Lower Lusatia, the New Mark, the Ucker Mark, and the duchy of Mecklenburg. The most fertile part lies near the Oder, in the circles of Havelland and Ruppin: the marshes have been drained, and the inhabitants cultivating millet, malt, and buckwheat, producing also wine, and breeding silk-worms, and having manufactures of alum and vitriol, and some medicinal springs. Among its cities and towns, which are reckoned 48, the chief are Berlin, Brandenburg, and Potsdam; and its hides of taxable land are 24,901.

The Ucker Mark terminates to the south and west on the Middle Mark and the duchy of Mecklenburg, from the latter of which it is principally separated by the Havel; and to the north and east on Pomerania and the New Mark, being mostly separated from the former by the Wehe and Rando, and from the latter by the Oder. Its greatest extent is about 13 German miles in length, and 11 in breadth. This province was anciently called the Ucker, or Uckerland, from the river and lake of that name; and the title of the Ucker Mark was first applied to it towards the latter end of the 15th century. If we except a narrow slip, which runs along the Middle Mark, from the frontiers of Mecklenburg towards the Oder, it consists of a very good soil, which, by the industry of the inhabitants, has been so much improved, that the province annually exports great quantities of grain, and more particularly supplies Berlin. It also produces a great number of sheep, fruit, honey, hops, and tobacco. The inhabitants are Lutherans, but not without a mixture of French and German Calvinists. The whole territory is divided into the two circles of Ucker-Mark and Stolp, and contains 15 towns, of which the capital is Prenzlau. The hides of land that are taxable are 6,379.

The New Mark is a long narrow tract of land, separated to the west from the Middle and Ucker Marks by the Oder, terminating to the north on Pomerania, and southward on Pomerania, Poland, Silesia, and the Lower Lusatia, and extending about 40 geographical miles in length, and in breadth 10 miles. Although the soil is generally sandy, this province has some good corn lands, and near the rivers luxuriant pasture grounds and marshes, the grafs of which are coarse and sandy. It abounds in wood, and supplies fruits, fish, and game. The incorporated circles produce wine, and yield great quantities of iron ore. The New Mark, properly so called, extends from the river Rega to the river Warte; and contains, according to the statement of Hooeck, 279,584 inhabitants. It appears to have been in the possession of the margraves of Brandenburg as early as the year 1257; it was transferred by Otho the Tall to the knights of the Teutonic order in 1286, but soon redeemed. In 1429, it was wholly ceded to the same order; and in 1443, the cession was confirmed at Frankfort, by the elector Frederick II. But in 1455, their circumstances required the sale of it, and it was purchased by the said elector; and since that time it has remained in the house of Brandenburg, under the appellation of the New Mark. It has a regency of its own, courts of justice, and other colleges. It consists of Celle, or Kufstein, which is the capital, seven original circles, and four incorporated circles. Its cities are reckoned to be 39; its hides of taxable land 16,738; and the value of the estates is estimated at one million of dollars.

The ancient inhabitants of Brandenburg are said to have been the Suevi, of whom there are several subdivisions. As the Romans pursued their conquests as far as the Elbe, about the commencement of the Christian æra, they were probably acquainted with this country. However, the Vandals checked their further progress in this direction; but, about the fifth century, they repaired more to the south, abandoning their own country to the Wendis, Veneti, or Heneti, who, being too much confined by the Vistula, occupied the territory which the Vandals had abandoned, and policed themselves of the whole country along the southern side of the Baltic, formed there a new nation, known by the general name of Slavini or Slavonians, who were a barbarous people of very extensive migration, and invertebrate enemies to the Christian religion. With the kings of the Franks, and especially Charlemagne, had frequent wars, and his successors were indefatigable in their endeavours to subdue them. At length, Henry, surnamed the Fowler, succeeded, about the beginning of the 10th century, A.D. 927, in the conquest of them, and planted Christianity in the country. He then conferred it on his brother-in-law Sigfrid, a Saxon count, with the title of margrave or lordwarden of the marches or borders; and he, with his successors, new planted and peopled it from the Netherlands, Wellphalia, Franconia, and Saxony. At first this title was conferred by the emperor according to his own arbitrary pleasure; and it did not become hereditary till the time of Albert, surnamed the Bear, the first prince of the race of Asauhelt, who was made margrave by Conrad II., and afterwards raised to the dignity of an elector by Frederic Barbarossa, about the year 1130. When this family became extinct in 1332, several others succeeded; and, in 1373, the emperor Charles IV. assigned Brandenburg to his second son Sigismund, who, in 1415, being then emperor of Germany, sold this margravate and electorate to Frederic, burgrave of Nuremburg, for four hundred thousand ducats. Frederic, the ancestor of the present reigning race, received the investiture of Brandenburg, in 1417, at the dict of Constance, from the hands of the emperor Sigismund, who, two years before, had conferred upon him the dignity of elector and archchamberlain of the holy Roman empire. This Frederic was the first elector of the house of Hohenzollern, which some German genealogists have traced to Thasillo or Taillon, who lived in the beginning of the 9th century. From Frederic the electorate descended, through different branches of the family, to Joachim II., who, in 1539, embraced the Lutheran religion, and who, whilst the war of religion devastated Saxony, and the neighbouring countries, maintained his electorate in peace; having declined to enter into the union which the Protestants concluded at Smalkald; nor did he agree to the interim published by the emperor Charles V. In 1618, the elector, John Sigismund, received from the king of Poland, the investiture of Posen for himself and his descendants; and resigned the electorate in favour of his son George William, who, in 1649, was succeeded by his son, Frederic.
Frederic William, surpassed the Great, born at Berlin in 1620, and educated in the camp of Frederic Henry, prince of Orange. When he came to the government, he found a defalcated country in possession of his enemies, allies in whom he could repose no confidence, few troops, and almost no resources of supplies. Nevertheless, he compelled the king of Poland, in 1657, to declare Prussia an independent state, which had been formerly held of the Polish sovereign; and closing a reign, which had been much celebrated, was succeeded, in 1688, by his son Frederic III., born at Königsberg, in 1617, who, supporting the emperor in the contest for the Spanish succession, was, by him acknowledged as king of Prussia, in 1690, and in the following year crowned by the emperor at his native place. This elector has been officially distinguished by the title of Frederic I. He died in 1713; when his son Frederic William II., ascended the throne. By him the city of Potsdam was founded in 1712; but he was chiefly distinguished as the father of that great prince Frederic II., who ascended the throne in 1740, and died in 1786, after a long and glorious reign; the most memorable and permanent event of which was the acquisition of Silicia from the house of Austria, in 1742. The short reign of his nephew is well known; during which the failure of the Prussian tactics in France and Poland, convinced Europe, that the great Frederic had been the soul of the machine. However, these checks were counter-balanced by the completion of the Prussian acquisitions in Poland. Of the reign of his son, the present monarch, it is sufficient now to say, that it has been marked by caution and prudence more than by enterprize. See Prussia.

The elector of Brandenburg possesses the seventh place among the electors of the empire; and in the council of the princes of the empire he has five voices. As arch-chamberlain, he carries the sceptre before the emperor at his coronation, and brings him water to wash with in a silver basin. For the government of Brandenburg, and the administration of justice, there are several supreme councils and tribunals.

Brandenburg, an ancient city of Germany, in the circle of Upper Saxony, and the margraviate to which it gives name; situate on the Havel, which separates the old town from the new, and the castle from both, and likewise environ the new town to the left with a particular trench, on which a fence has been erected. Both these towns have, ever since the year 1714, been under the government of the family of Waldersee; and each of them contains two churches, the number of inhabitants does not exceed 6000. It was erected into an episcopal see by the emperor Otho I. in 919, but the see was abolished at the reformation, in 1563. Manufactures of cloth, fulling, and canvas have been established in this place by the French Calvinists; and the navigation of the Havel affords it a considerable trade. The fort appears like a suburb, and contains, besides the cathedral church, and refuges for the members of the cathedral, a riding school for the instruction of young noblemen. The members of the chapter, which fill subfunds, and which is composed of a Lutheran provost, dean, sub-dean, and three other canonists, are distinguished by a crock of gold, enamelled with violet, and terminating in eight points: an honour conferred by Frederic II. in 1755. In the vicinity is a mountain, on which Henry I., in 922, erected a church in honour of the Virgin Mary, from which time the mountain had the name of "Marienberg." The church has been destroyed, and its site planted with vines. Near the old town is a lake, about two German miles long. Brandenburg is 18½ miles W. from Berlin. N. lat. 53° 57'. E. long. 14° 31'.

Brandenburg, New, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg, feoted on a small rivulet, which loses itself in a neighbouring lake. The town is flourishing, and has two churches, a grammar-school, and a superintendency. Hops are much cultivated in its environs; 48 miles W. of Stettin, and 60 N. of Berlin.

Brandenburg, a town of Prussia, in the province of Natangen, near the Fricke-Fluss, chiefly inhabited by fishermen; 12 miles S. W. of Königsberg.

Branden, in Entomologia, a species of Cenex, that inhabits Sarabry, the front of which is bent; thorax some what fix-imped; veins with three white dots. Gmelin.

Brandery, a species of Phalena, described by Linnaeus in Entomologia. The first wings are tattaceous, fuscous, and without spots. A native of Europe.

Branderm, in Geography, a town of France, in the department of Morbihan; league L. E. of Hennebont.

Brandenboom, in Ecclesiastical History, a linen cloth or veil put over the tombs of the apollies St. Peter and St. Paul, and left there for some time: by which it is supposed to acquire a degree of sanctity, so as to be worshipped as a relic; and for that purpose frequently lent by the pope as a present to foreign princes. In this leaf, brandenboom amounts to the fame with what is otherwise called frankentum, fuldarium, ovarium, and valum. The use of brandenboom was introduced as a means of diffusing and propagating the virtues and influences of relics, without moving or any way impairing the substance of them; the translation of relics in early days being forbidden. Fleur. H. E. i. 35. Du-Cange, Gloss. Lat. i. i. p. 920.

Brandegans, in Ornithology, the name given by Clusius and Frisch to the fieldlark or burrow duck, anas tadorna, Linnaeus.

Brandeguth, in Geography, a town in Germany, in the circle of Upper Saxony, and country of Erzgefähr; 4 miles N. E. of Lauterlein.

Brandhirsch, in Zoology. See Cervus hippelaphus.

Brandi, Giacinto, in Biography, an Italian painter of history, was born at Poli, about 20 miles from Rome, in 1623, and first instructed by Algarde, and afterwards, by Giacomo Sementa of Bologna, who painted after the manner of Guido. Upon quitting the school of Sementa, he became a disciple of Lanfrance; and having exercised his art in several of the churches and palaces at Rome, he rose to such reputation, that he became head of a school, and was made president of the academy of St. Luke. He obtained the patronage of several princes of rank, and especially that of the pope, who created him a knight of the order of Chiriol; but less attentive to fame than fortune, and more remarkable for avarice than excellence, although he had a lively genius and free pencil, he was often very incorrect, and his colouring was feeble. He seldom associated with personages of his own profession, of whom he generally expressed an unfavourable opinion: but took pleasure in low company, dissipating by prodigality and pleas, the wealth which his industry acquired. He died in 1634. His works are chiefly at Rome, Verona, Milan, and Guta. The daughter of this painter was married to the celebrated Rafa da Tiroh, of whom Giacinto conceived a mean opinion, because he painted only scenes. By this contemptuous behaviour Rafa was so incensed, that he collected all the clothes belonging to his bride, on the morning after marriage, and sent them back to her father, with a message, "that his daughter's person was fortune enough to make her husband happy; and that a good painter of scenes was likely to become rich, as a bad painter of men," Argenville. Pilkington.
BRANDING in the face or hand, denotes a punishment inflicted by law on various offences, by burning with a hot iron, after the offender has been once admitted to benefit of clergy.

By 4 Hen. VII. c. 13, a distinction was established between clerks and scholars, and being in orders, by directing, that a layman, who are allowed the privilege of clergy, should be burnt with a hot iron in the brawn of the left thumb. This distinction, however, was abolished for a time by 28 Hen. VIII. c. 1, and 32 Hen. VIII. c. 3, but it is held to have been virtually reëstablished by Edward VI. c. 12. After this burning, the laity, and before the clergy, were dischared from the sentence of the law in the king's courts, and delivered over to the ordinary to be dealt with according to the ecclesiastical canons. But the trial in the ecclesiastical courts, and consequent purgation, were attended with such perjuries and abuses, that the statute 18 Eliz. c. 7, enacted, that after the offender had been allowed his clergy, he should not be delivered to the ordinary; but, upon such allowance and burning in the hand, he shall forthwith be enlarged and delivered out of prison; with proviso, that the judge may, if he thinks fit, continue the offender in gaol for any time not exceeding a year. Thus the law continued for above a century; except only that the statute 21 Jac. I. c. 6, allowed, that women convicted of simple larcenies under the value of 10s. should be burned in the hand, and whipped, flogged, or imprisoned for any time not exceeding a year. And a similar indulgence by the statutes 3 & 4 W. & M. c. 9, and 4 & 5 W. & M. c. 24, was extended to women guilty of any clergyable felony whatsoever, who were allowed to claim the benefit of the statute, in like manner as men might claim the benefit of clergy, and to be dischared, upon being burned in the hand, and imprisoned for any time not exceeding a year. The punishment of burning in the hand, being found ineffectual, was also changed by statute 10 & 11 W. III. c. 23, into burning in the most visible part of the left cheek, nearest the nose; but this provision was repealed by statute 5 Ann. c. 6. It was farther enacted by the same statute, that when any person is convicted of any theft or larceny, and burnt in the hand for the same according to the ancient law, he shall also, at the discretion of the judge, be committed to the house of correction or public work-house, to be there kept to hard labour for any time not less than six months, and not exceeding two years; with a power of inflicting a double confinement in case of the party's escape from the first. It was also enacted by 4 Geo. I. c. 11, and 6 Geo. I. c. 23, that when any persons shall be convicted of any larceny, either grand or petit, or any felonious stealing or taking of money or goods and chattels either from the person or the house of any other, or in any other manner, and who by the law shall be entitled to the benefit of clergy, and liable only to the penalties of burning in the hand or whipping, the court, in their discretion, instead of such burning in the hand, or whipping, may direct such offenders to be transported to America, (or, by statute 19 Geo. III. c. 74, to any other part beyond the seas) for seven years. See TRANSPORTATION. It is also enacted by the same statute, 19 Geo. III. c. 74, that, instead of burning in the hand, the court in all clergyable felonies may impose a pecuniary fine, or (except in the case of manslaughter) may order the offender to be once or oftener, but not more than thrice, either publicly or privately whipped; which fine or whipping shall have the same consequences, as burning in the hand; and the offender, to fined or whipped, shall be equally liable to a subsequent detainee or imprisonment. See Benefice of Clergy.

BRANDIS, in Geography, a town of Germany, in the circle of Upper Saxony, and territory of Lepidick; 9 miles E. of Lepidick.

BRANDELCHT, a town of Germany, in the circle of Westphalia, and county of Bentheim; 3 miles S. S. E. of Northum.

BRANDMULLER, GREGORY, in Biography, a painter referred by the Germans to the first rank of artists, was born at Baffe in 1461; and, in confluence of having discovered a genius for his art, and of having acquired a knowledge of design by studying and copying some good prints in his father's poesifion, he was placed under the tuition of Caspar Meyer. From Baffe he removed to Paris, and was admitted into the school of Le Brun, whose esteem and preference he acquired by his proficiency in his profession to such a degree, that he became the object of jealousy to others, and was under a necessity of retiring into his own country; having first obtained the prize in the Royal Academy at Paris. He excelled in history and portrait; and resembled Le Brun in the fire, elevation, and grandeur of his subjects. His design is correct; his expression just and animated; and his method of colouring good, so that it retained its original strength and beauty without fading. He died in 1601. Pilkington.

BRANDO, in Geography, a small island in the gulf of Bothnia, containing 6 or 7 villages, a church, some arable land, and small woods.

BRANDO, a town in the island of Corfica; 6 miles N. of Balla.

BRANDOLINI, Aurelio, in Biography, an eminent Italian poet, divine, and polite writer, was born of a noble family at Florence in the 15th century, and surnamed "Lippus," on account of a deflation from his eyes, which, at an early age, had nearly deprived him of his light. Notwithstanding this misfortune, he acquired great eminence in various kinds of literature; and he found in these, sources of consolation, amidst the afflictions occasioned by a defect of sight, and the loss of his fortune. Among other excellencies for which he was distinguished, he was singularly ready in his poetic compositions: and this talent he possessed in an eminent degree, that he is said to have put into very elegant verse, without premeditation, all the topics of Pliny's 37 books of Natural History. Corvins, king of Hungary, hearing of his fame, invited him to his court; and employed him, for several years, in teaching rhetoric at Buda and Gran. After the death of that king, in 1490, he returned to Florence, and assumed the habit of the friars of St. Augustin. In this new profecion, he applied affidually to the exercise of his ministry, and preached, with great applause, to crowded audiences in several parts of Italy. As to the character of his sermons, it is said, that they were distinguished, not only by ingenious illustrations of the Scriptures, but also by a strain of sublime philosophy derived from the ancients. After residing for some time at Naples, where he had for his scholar Gammaria del Monte, afterwards pope Julius III., he settled at Rome, and died there of the plague in 1498. The most valuable of his numerous works were his 3 books, "De Ratione Scribendi," containing the precepts of good writing, and written with singular learning and elegance; his two books, entitled "Christian Paradoxa," first printed at Bafil in 1543, 8vo; "De Humane Vitae Conditione, et tollenda Corporum Egregiudine," Th ese, with some others, were printed at Bafil in 1598. He also published, in heroic verse, the histories of the O. and N. T., a commentary on St. Paul's epistles, a treatise "De Leges," some orations, and some Latin and Italian poems; and left, several treatises in MS. on political and historical subjects. Tiraboschi. Gen. Dict.
BRANDON, in Geography, a market-town of Suffolk, England, is pleasantly situated on the banks of the River Ouse, which is navigable from Lynn to Thetford, and forms part of the boundary between the counties of Suffolk and Norfolk. By the navigation of this river, various articles of trade and commerce are imported, and exported from the town. An ancient bridge is thrown across the river, upon which was a terracotta in 1426, belonging to the bishop of Ely. Upon the decay of this structure, that prelate granted 40 days' pardon to all persons who contributed towards its repair, and, as a mark of this, a pardon for three years. This town gives the title of Duke of Brandon to Archibald Hamilton, that title being first conferred by Queen Anne in 1711.

Simon Eyre, lord mayor of London, who built Leadenhall, was a native of this town. Here are a weekly market on Thursdays, and four fairs annually. In the vicinity of Brandon, there are very extensive rabbit Warrens, which supply the London markets with vast numbers of this animal.

Brandon, a township in America, in Rutland county, Vermont, situates on both sides of Otter Creek, containing 637 inhabitants; about 60 miles N. of Bennington. Here Brandon Creek discharges itself into Otter Creek, from the North Earl.

Brandon, a harbour on the N. side of Long Island, New York, 9 miles W. of Smithtown, and at the same distance from Hempstead plain.

Brandon, St. the name of an islet or rock lying in the Indian Ocean, to the N.E. of the island Bourbon and Mauritius. S. lat. 10° 45'. E. long. 64° 48'.

Brandon, a mountain in the county of Kilkenny, Ireland, below which the river Bann flows; it is the seat of the granite chain which forms its base in the county of Wicklow, and though its elevation is not remarkable, it commands a very extensive prospect.—Also, a very high mountain in the county of Kerry, Ireland, which is seen at the distance of 15 leagues, and is an important land-mark for mariners. Its summit is generally covered with clouds; and it is esteemed a certain token of fine weather when its top is visible. It received its name from St. Brandon, who had an oratory, or chapel, near its summit.

Brandon Bay, a bay on the western coast of Ireland, near Tralca bay, in the county of Kerry. On the west it has Brandon mountain, and, on the east, a flat low land called Magherielin, off which is a cluster of small islands. This bay is open to the north, and has neither safe anchorage nor tolerable shelter. Smith's Kerry.

Brandon Head, a cape of Ireland, forming the western extremity of Brandon bay, and projecting from the lofty Brandon mountain. It is about 15 miles wide at Tralca, and 10 north of Dingle. N. lat. 52° 17'. W. long. 10° 1'.

Beaufort.

BRANDRITH denotes a trout, or other river fish, wherein to set a fisher over the fire.

BRANDRITH, among Builders, denotes a fence, or rail, about the mouth of a well.

BRANDT, Gerard, in Biography, an eminent historian, was born at Amsterdam, in 1626, and, after a course of preparatory study, commenced his ministry with a congregation of remonstrants at Nieuwkoop. Having married a daughter of the celebrated Gaspar Barlaeus, he removed thither to Hoorn, and finally to Amsterdam in 1667. His principal works are, "A short account of the Reformation in the Low Countries, and the War with Spain," 1658: "History of the Reformation, and other particulars concerning the Church of the Low Countries," 4 vols. 1671, &c. This work, written in Dutch, contains a faithful and accurate representation of the important events, concerning which it treats; and, though highly was it esteemed, that peripatetic Fugel told bishop Burnet that the perusal of this alone would amply recompense the trouble of learning the Dutch language.

We have an English translation of it by Chamberlayne, and it has been abridged in French, in 3 vols. 1670. Brandt also wrote "A History of the Town of Enkhuizen," "Life and Exploits of Admiral Ruysbroeck," "Account of the Proceedings against Barneveldt, Hoogerbeets and Grotius," "Poems," &c. He died in 1695.

BRANDT, Nicholas, or, as some call him, Sebastian, a German chemist, much addicted to the fanciful researches of the period in which he lived, was born in 1588, and died in May, 1651. Leibniz, in the Mélanges de Berlin for 1710, cited by Chaptal, in his "Elements of Chemistry," vol. iii. p. 350, mentions Brandt as a chemist of Hamburg, who, during a course of experiments upon urine, with a view of extracting a fluid proper for converting silver into gold, discovered phosphorus in 1667, or, as others say, in 1669. He communicated his discovery to Kraft, who imparted it to Leibniz, and, as it is pretended, to Boyle. (See Boyle.) Leibniz, says Chaptal, introduced Brandt to the duke of Hanover, before whom he performed the whole operation; and a specimen of it was sent to Huygens, who fixed it to the Academy of Sciences at Paris. It is said, that Kunckel had associated himself with Kraft to purchase the process from Brandt; but Kunckel having been deceived by Kraft, who kept the secret to himself, knowing that urine was made use of, let to work, and discovered a process for making the substance; and hence it has been called Kunckel's phosphorus. See Phosphorus.

BRANDY. This valuable spirit is produced by the distillation of wines of all kinds, and, properly speaking, by no other fermented liquor, though, as we have explained fully, under the article Alcohol, the purely spiritual part of all fermented vinous liquors, procured by distillation, is essentially the same; and, therefore, an infinite variety of imitations of the intermediate products of distillation may be produced by adding flavouring and colouring matters to any kind of pure spirit.

Brandy is prepared in many of the wine countries of Europe, and, with particular excellence, in Languedoc, in Anjou, whence the well-known Cognac brandy, and other parts of the south of France.

The general mode of preparing it is extremely simple, being nothing more than a well-regulated distillation of wine from suitable vessels. This manufactory is technically termed, in France, Brudere, and in England, Brudere d'eau de vie.

Though every wine will give a certain portion of brandy, by distillation, it is not every kind that can be used with advantage. In general, the strong heavy wines are to be preferred. Those that do not yield a fifth of their quantity of spirit, are not worth the expense of working.

The apparatus is composed of three parts, the alembic, or boiler, the capital fitted on the top of the boiler to receive the spirituous vapour, and the fermenting, or warm, a convoluted pipe fitting to the back of the alembic, and immerged in water, in which the vapour is conducted, and flows out at the bottom, in the form of distilled spirit.

The alembic is a cylindrical copper boiler about 30 inches in diameter, and 24 in diameter, flattened at the bottom to prevent a greater surface to the fuel, and drawn out into
into a neck at the top, about 2 inches high, and only 3 or 10 in diameter. The capacity of this alembic is about 320 quarts. The capital, which fits on the neck of the alembic, is somewhat in the form of a very flattened cone, with the apex downwards, and truncated where it joins the alembic. Its diameter here is of course a trifle more than that of the neck of the alembic over which it fits; above, its diameter is about 7 or 8 inches more. A tube, or beak, projects laterally from the lower part of the capital, to convey the vapour into the potter's kerpine or worm, which makes five or seven turns before it reaches the bottom of the large tub of water in which it is immerced. The diameter of the worm is about an inch and a half at the upper part, where it joins the neck of the capital, and leaffs gradually to one inch towards the bottom.

The alembic is built into brick-work, which lines the whole, except the bottom, and a few inches below the neck. Beneath the alembic is the fire-place, made so that the flame of the fuel (generally wood) immediately touches the flat bottom of the alembic, and furnished with an aff-bat, flame, and regillers, or dampers.

In distilling, the alembic is first filled to about five-sixths of its capacity, with wine, (which, in the above dimensions, is from 5 to 6 quintals,) and the fire kindled beneath. When the wine is near boiling, the capital is put on, and all the joints luted with clay and ashes, and presently a thin stream of brandy begins to fall from the lower extremity of the worm, into a large cask fed to receive it. The fire is kept up, and the distillation continued, till all the spirit is got from the wine; after which, the fire is let out, and the remaining contents of the alembic are drawn off by a cock at the bottom, and thrown away as taffels.

In distilling, care should be taken not to urge the fire too much at first, otherwise the wine boils up into the capital, and comes over into the worm, mixing with, and fouling the spirit. In general, the flower the process, and the smaller the stream of spirit from the worm-pipe, the finer and better is the brandy. The distillers make a distinction between the former and the latter runnings of the spirit. What first comes over has the strongest, richest, and highest flavour, and this is gradually lessened, and the spirit becomes more and more watery to the end. Therefore, when the brandy becomes weak, the portion already distilled is set apart, and the remainder is collected in a separate vessel, and is called seconds, or petite eau, or spirit, in the term of British distillers, and is not immediately fit for use, but is redistilled with fresh wine, in the next processes, being still too valuable to be lost. It is obvious, that the precise point at which this distillation is made, must be arbitrary, and, therefore, it is determined, in some countries, by the proportional quantity of spirit obtained, to the wine put into the alembic; and, in others, by a certain specific gravity; in Spain and Portugal, (as with rum in the West Indies,) the skinking of olive oil in the spirit is the established proof. The wine is known to be entirely exhausted of its spirit by taking a small quantity of the liquor at that time distilling over, laying it on the heated part of the alembic, and putting a lighted match to it. If the flame which it gives, takes fire, burning with a blue flame, it is still spirituous; if not inflammable, the liquor is little else than water. It takes about nine or ten hours to run off the quantity above mentioned, in which time about 60lb. of coal is used, when this is the fuel.

Brandy is naturally clear and colourless as water; for the different shades of colour, which it has in commerce, arise partly from the casks in which it is kept, but, chiefly, from the addition of burnt sugar, faunders wood, and other colouring matters that are intentionally added by the manufacturer, and which appear to do neither good nor harm to the quality of the spirit.

There are several ways of judging of the strength of the spirit. Many are mentioned under the article Alcohol. The following is also much used by the dealers: a phial is filled three quarters with the brandy, stopped with the thumb, and suddenly knocked, with some force, against the knee, to prevent breaking it. This rakes a froth on the surface, and, by the size and diminution of the bubbles, a good idea may be formed of the strength of the liquor by those who are in the constant habit of examining samples. This is, however, as liable to error as the trial with gunpowder, burning, &c.; for it is well known, that certain additions may be made to brandy which will very much alter the frothing. After all that has been done, it is still a difficult problem to determine, with perfect accuracy, the strength of all kinds of made spirits, by any shorter method than that of distillation, though the improved hydrometers answer most of the purposes of trade and revenue.

The strength of the spirit, of course, depends on the strength of the wine from which it is made, and this, again, depends on the quantity of saccharine mucilage contained in the must or grape-juice, and the perfection of the fermentation. Generally speaking, the wines of hot climates furnish much more spirit than those of colder; and sweet, rich, well-ripened grapes give much more than the cold, four, watery fruits. The richest wines furnish as much as a third of spirit; and the general average of the wines in the south of France and Spain is stated to be, by Chaptal, about a fourth. On the other hand, some of the northern wines (though perfect as wine) give no more than a fifteenth of spirit.

The principal differences in the quality of brandies are strength, or quantity of alcohol, and flavour, which latter is given, apparently, by several principles contained in the wine. There appears to exist in wine a peculiar aroma, or flavouring principle, which is imparted (somewhat altered, indeed, by distillation) to the brandy procured from it. This, whatever it is, is heightened by every subsequent rectification of the brandy, and is entirely lost when the alcohol or purely spirituous part is extracted. There are also several unpleasant flavours found in different kinds of brandy, and which greatly impair its excellence and delicacy for the table. The flavour of eupyrrea, or burning, is the commonest. This is properly termed, since it is fearfully ever found in the very first portions of any distillation, but increases as the process continues; when the wine, therefore, has undergone a longer impreffion of heat, and when, from the decreasing strength of the spirit, a higher temperature than at first is required to keep the wine boiling in the alembic. This burnt flavour is also more prevalent where the construction of the still is such as to require a longer continuance of the boiling, and may, at any time, be given, by raising the heat much at the end of the process. Though this flavour is disagreeable to the finell judges of brandies in the wine countries, it has become, through the caprice of fashion, an excellence in some exported brandies, and must, accordingly, be given by the manufacturer.

Chaptal, with great probability, attributes this burnt taste, in a great measure, to the presence of the malic acid in the wine, which also appears, in some degree, in the spirit distilled from it. He observes, that the thin or ill-fermented wines contain much of an acid which, by its forming insoluble salts with lead, silver, and mercury, and lime, and by other chemical tests, is proved to be the malic, and it also appears in great abundance in cyder, perry, and other such
harsh wines. All these, when distilled, yield a spirit which is of bad quality, acid, empyreumatic, especially in the hard-distilled portion, and even contains a sensible quantity of the same acid which has passed over in distillation. The addition of ch. kk. alkali, or lime water to the wine does indeed keep down the acid, and prevents it from passing into the spirit, but with a very remarkable diminution of the quantity yielded, and even then, the empyreumatic odour remains. On the other hand, the richer wines are those that are the most free from this acid.

Another substance, which gives a very strong, and molily, unpleasant flavour and smell to brandy, appears to be an essential oil of peculiar nature, which is found in the spirit of some of the richell and fullest bodied wines. The exact nature of the oil is not known, nor can it be well accounted, whether it is different from the common flavouring principle, or aroma of wines, except in being so abundant, as to be in part altered by distillation, and changed thereby from a grateful to a nauseous substance. When spirit, charged with this oil, is rubbed in the hands till dry, a strong ungrateful smell is left by this oil, refembling, in some degree, the breath of drunkards. Sometimes this oil is in such a quantity as to separate, in part, from the spirit as it cools, and is found in the capital, as a concrete, fetty oil, strongly nauseous to the smell and taste. Brandy distilled from this oily wine is, in fact, a saturated solution of this essential oil in alcohol. It is much improved by a second rectification, with the previous addition of pure water, which immediately renders the spirit milky, separates it from a great part of its oil, and, by very careful rectification, the spirit riles much more pure than before. Any artificial solution of an essential oil in alcohol may be rectified, and the oil separated in the same manner.

The manufacture of brandy, in other countries, very closely resembles the French processes which we have just described. Thus, in Spain, the still is filled to four-fifths of its contents with wine, the capital luted on, a fire kindled, and, in about an hour and a half, the spirit begins to come over. About a fifth of the entire quantity of wine is proof-spirit, in which olive oil is added, and comes over at first to be used, without further process; and, as much of inferior and weaker spirit comes over afterwards, which is rectified and rectified. When the wines are old, heavy, and oily, and a fine clear spirit is wanted, some water is added to the wine before distillation, to keep down the oil. The principal distilleries in Spain are in Catalonia.

In Portugal, the olive-oil proof is also employed, and the wines are there also of heavy and oily, as often as to require the addition of water, which, however, is not added to the wine, but only to the brandy before rectification.

An inferior kind of brandy is made from the marc of grapes, or the residue of the grapes after the juice has been pressed out. This still retains enough of the grape-juice to be readily brought into fermentation, when properly arranged, and, therefore, to be capable of yielding afterwards a spirit by distillation. In Switzerland, it is thus performed: Wine-casks are filled with the fresh marc quite full, and pressed down by trampling, to make it lie close, and prevent it from moulding; the casks are then headed, and the dung-holes and joints are closed up with clay. In two or three days, fermentation begins, the marc heats, and when the first working has subsided, and it has got an agreeable vinous smell, (which happens in from two to four or five weeks,) it is fit for distillation. The alembic may be filled quite to the top with the fermented marc, and just water enough is added to wet it thoroughly. The fire should be very slack, and kept up very moderately in the process, otherwise, the marc, nearest to the bottom, will burn, and give a very unpleasant taste to the brandy. Thirty-two cubic feet of fermented marc will give about ten gallons of spirit. If not wanted immediately, the marc will keep without spoiling in the barrels, if well closed, for two, three, or even four months. This spirit should be rectified over ashes or lime-water to become very dry. 

M. Beaumé, in his experiments, found, however, that he could obtain a very good spirit from the marc, by a simple distillation, either by immersing the alembic in a water-bath, and thus regulating the heat, or by making a kind of wicker cradle within the alembic, raised an inch or two from its bottom, and letting the marc fall upon it, so as to be prevented from coming in contact with the bottom, where the heat is strongest, and adding water, as before, and distilling with a slow fire. By this contrivance, all the burnt flavour was avoided, and the spirit rose at first very pure and good.

Various improvements have been proposed, and partly adopted, in the construction of the alembics and distillatory apparatus, the chief of which, with other observations relating to the general art of preparing Distilled Spirits, will be described under that article. See also Wine and Alcohol.

Beaumé et Rozier, in Jour. de Phy. tom. xii et xvi.

Brandy-Cherry. —See Cherry.

Brandy-Pots. —In Geography, the name given to islands, in the river St. Lawrence, 46 leagues below Quebec.

BRANDYWINE, a township of America, in Chester county, Pennsylvania.

BRANDYWINE Creek, a creek of America, which falls into Chirilliana creek from the northward, at Wilmington, in the state of Delaware, about 25 miles from its N. and N. W. sources in Chester county, Pennsylvania. This creek is famous for a battle, fought on the 11th of September 1777, and terminating with considerable loss by the British troops. In consequence of this battle, Philadelphia was taken possession of by general Howe on the 26th.

BRANE, a river of South Wales, which runs into the Towy, near Llanidlovery, in the county of Carmarthen.

This is real, a river of South Wales, which runs into the Usk, 3 miles W. of Brecknock.

BRANFORD, a township of America, in the county of New Haven, and state of Connecticut, lying on the south side of a river of the same name, which runs into Long Island, found, to 10 miles E. of New Haven, and 40 S. of Hartford. It is considerable on account of its iron works.

BRANG, a town of Poland, in the palatinate of Volhynia; 44 miles S. W. of Lutsko.

BRANGE, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Louhans, half a league N. W. of Louhans.

BRANTZ, a town of Silesia, in the principality of Oppau; 4 miles S. E. of Jagerendorf.

BRANITZ, a town and district of Russie, in the government of Moscow, seated on the Moscva, between Moscow and Kolomna.

BRANK, in Botany, polygonum fagopyrum, buck-wheat.

BRANK. See Scolding Bridle.

BRANKER, or BRANCKER, THOMAS, in Biography, an eminent English mathematician, was born in Devonshire, in 1656, admitted butler of Exeter college, Oxford, took the degree of B. A. in 1655, and that of M. A. in 1658, and
and became a preacher. Upon the restoration, objecting to conformity to the Established church, he resigned his fellowship at Oxford in 1662, and retired to Cheltery; but changing his mind with respect to conformity, he was episcopally ordained, and was appointed minister of White- gate. By his attention to mathematics and chemistry, in the study of which he employed his intervals of leisure, he obtained the patronage of Lord Crewe, who gave him the rectory of Tilbury. Being afterwards appointed master of the well-endowed school at Macclesfield, he spent the remainder of his life in that place, and died there in 1766. His mathematical writings were "A Piece on the Doctrine of the Sphere," in Latin, published at Oxford in 1663; a translation of Rhonius's algebra, entitled "An Introduction to Algebra," 4to. Lond. 1668, in which he liberally acknowledges the assistance of Dr. Pell. He also corresponded on subjects of mathematics with Collins, and other eminent men. Hutton's Dict.

BRANKYRKA, in Geography, a town of Sweden, in the province of Svedenmanland.

BRANLE, Fr. a kind of dance, very gay, brought hither from France in the time of Charles II.

BRANLIN, in Ichthyology. See SAMLET.

BRANNE, in Geography, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Libourne; 2 leagues S. of Libourne. The town contains 5,444, and the canton 10,726 inhabitants; the territory includes 155,5 kilometres, and 21 communes.

BRANNOKENIUM, in Ancient Geography, a town of the Or dovices, in Ptolemy's description of Britain, placed by Camden and Baxter at Worcestor, supposing that some transferee had committed a mistake in affixing it to the Or dovices, from which territory Worcestor is too remote. Mr. Horsey places it near Ludlow, which might belong to the Or dovices.

BRANNOVII, a people mentioned by Caesar, who were under the protection of the Ædui, and who furnished him with troops. They are placed in a small canton of Burgundy in France, called the "Brienois," to the west of Maconnois.

BRANNY, in Botany, furfuraceous, covered with branny scales; a term applied to the ripes, or stalks of some species of fungi.

BRANDONEUM, in Ancient Geography, one of the nine forts, subject to the command of the count of the Saxon shore in Britain; garrisoned by the equites Dalmatia, and seated on the Sinus Metaris; now Brancaster in Norfolk, on the wales.

BRANSEE, in Geography, a small islanth of Denmark, in the Little Belt; 5 miles W. N. W. from Aflens.

BRANSK, a town and district of Russia, in the government of Orj, situu on the Dafian. - Alto, a town of Poland, in the palatinate of Bielk, 16 miles W. of Bielk.

BRANeka, a town of Tranfylvania, seated on the Marith. N. lat. 46° 6'. E. long. 25° 17'.

BRANSON, a town of Switzer land, in the Valais, north of the Rhone, and about 2 miles N. E. of Martigny. N. lat. 46° 11'. E. long. 6° 57'.

BRANT, a river of North Wales, in the ile of Angle- sea, which runs into the Menai, about 3 miles S. from New- burgh.- Alto, a town of Germany, in the archbishopcy of Aquitania; 8 miles E. of Zvejt.

BRANTA, BRENTA, and BRENT-GOOSE, in Ornithology, synonymous names of Anas Bemicha, the common brown goose of the English.

BRANTA TERRIDA, is the name given by Scopoli to Anas terrida. Gmel.
ments in favour of that race, at Methone, Pylus, and Amphipolis.

The Brafinia were celebrated with sacrifices and games, at which none were allowed to contend but free-born Spartans. To be absent from these solemnities is said by some to have been hell criminal, and punished with fines. Meurf. Græc. Perial. Potter. Arch. Græc. li. cap. 26.

BRASIL, or BRAJZ, in Geography, an extensive and opulent country in South America, belonging to the Portuguese, and of such importance as to be almost essential to the existence of their monarchy. It derives its name from the wood which is so called, mentioned by Chaucer, and known many ages before his time. It is bounded on the north by the river of the AMAZONs and the northern Atlantic ocean, on the east by the southern Atlantic ocean, on the south by the mouth of the river La Plata, and on the west by a multitude of moraines, lakes, rivers, and mountains, which separate it from the dominions of the Spaniards; and extends from the frontiers of Dutch Guiana, N. lat. 3°, to Port St. Pedro, S. lat. 31°, including 35° of latitude, or 2100 geographical miles, and in breadth from Cape St. Roque, to the farthest Portuguese settlement on the river of Amazonas, called St. Paul de Omunagas, comprehending at least the number of 50 miles. Some have ascribed the first discovery of Brafit to Martin Behem, in 1481, (see Behem,) but this, however, has been more generally allowed to Pedro Alvarez Cabral, who, being entrusted with the command of a powerful fleet, designed by the king of Portugal not only for the purposes of trade, but also of conquest, set sail in 1500; and in order to avoid the coast of Africa, where he was likely to be retarded in his voyage by variable breezes or frequent calms, he stood out to sea, and kept so far to the west that he found himself, to his surprise, upon the shore of an unknown country, in the 10th degree beyond the line. He first thought that it was some island in the Atlantic ocean that had not been before observed; but proceeding along its coast for several days, he was led gradually to believe, that a country so extensive formed a part of some great continent. This country proved to be that called by its discoverer "St. Croix," but now known by the name of Brazil. Here he landed, and having conceived a high idea of the fertility of the soil, and the agreeableness of the climate, he took possession of it for the crown of Portugal, and dispatched a ship to Lisbon, with an account of that event, which appeared to be no less important than it was unexpected. The Portuguese, however, notwithstanding the flattering report of Cabral, entertained, for some time, no very favourable opinion of this country; because they found, after a survey of its harbours, bays, rivers, and coasts, that it afforded neither gold nor silver; and accordingly they sent thither none but condemned criminals and abandoned women. Two ships were annually sent from Portugal for this purpose, and they returned with parrots, and woods for the use of the dyers and cabinet-makers. In 1548, when the Jews were persecuted by the inquisition, they were plundered of their possessions and banished to Brazil. But receiving encouragement from some of their mercantile friends in different nations, with whom they had formerly been connected, they were enabled to procure sugar cane from the island of Madeira, and to establish sugar plantations. The court of Lisbon, perceiving that the mother-country might derive considerable advantage from this colony, although it furnished them neither gold nor silver, sent thither, in 1549, Thomas de Souza to regulate and superintend it. This governor, notwithstanding the talents which he possessed, found it very difficult to reduce those who had been accustomed to anarchy to due subordination, and to induce the natives, who were dispersed through the forests and plains, and who had no settled habitations, to associate with one another, and to submit to the yoke which the Portuguese seemed desirous of imposing upon them. A dissatisfaction ensued between both parties, which at length terminated in war; nor was the force that had accompanied Souza sufficient to bring it to a peaceful termination. This was in some measure effected by the establishment of a kind of central and rallying point for the colony at St. Salvador, which was built in 1549, on the bay of All-Saints, and which was the first Portuguese settlement in the country; but the object was chiefly accomplished by the address of the Jesuits, who, differing themselves among the Indians, and striving to engage their esteem and attachment, and thus to extend the influence of the Portuguese, and to induce, as well as to augment, the advantages which the mother country derived from this settlement. The Indians, instructed by the Jesuits and employed by them, distributed among the savage natives hatchets, knives, and looking-glasses with such effect, that they were induced to regard the Portuguese as an inexhaustible and humane people. The increasing prosperity of the colony became gradually known in Europe; and excited the envy of the French, Spaniards, and Dutch successively. The latter, however, were the principal enemies with whom the Portuguese had to contend in their new settlement. In 1624 the Dutch admiral Willekens was detached with a powerful squadron, and a considerable number of soldiers and marines for Brazil; and having cast anchor before St. Salvador, the capital of the country, and the residence of the Portuguese vicerey, he landed his forces, expelled the inhabitants, and took possession of the town. After having plundered it of its wealth, he appointed colonel Van Dort as governor, and left with him a strong garrison for his support. His first act was the publication of a manifesto, in the name of the States, allowing liberty of conscience to all who were willing to take an oath of fidelity to the republic of the United Provinces. When an account of the successes of Willekens arrived in Holland, it was received with great satisfaction, and it was concluded, without hesitation, that the entire conquest of Brazil would ensue. Upon the return of Willekens to Europe, the Spaniards were prepared with a squadron of 56 sail, under Frederic de Toledo, which was destined to drive the Hollanders out of Brazil. The fleet was manned with 12,000 soldiers and marines, who, immediately upon their arrival, laid siege to St. Salvador, which, after an obstinate resistance and the loss of its governor Van Dort, was obliged to capitulate. When the affairs of the Dutch at home assumed a more favourable aspect, they dispatched admiral Lombe, in 1639, with a strong armament to the South American sea, and he arrived on the coast of Pernambuco, or Pernambuco, one of the most considerable and best fortified provinces in Brazil, and, after several obstinate engagements, succeeded in reducing it. He left behind him troops which reduced, in the years 1635, 1634, and 1649, the three provinces of Tembraca, Paraiba, and Rio Grande. These four provinces furnished annually a large quantity of sugar, wood for dyeing, and other commodities, which supplied the Hollanders with such an accession of wealth, that they determined to conquer the whole country; and entered Maurice of Nassau with the conduct of the enterprise. After resisting many well-conducted efforts for self-defence on the part of Almroque, Bajoula, Lewis Roca de Borgia, and Cameron of Brazil, idolized by his people, and himself devoted to the interest of the Portuguese, the Dutch took possession of the provinces of Santa, Sergippe, and the greatest part of that of Bahia. Having thus
thus acquired seven out of the fourteen provinces into which Brazil was divided, they expected soon to conquer the other seven, when Portugal recovered its independence by the elevation of the family of Braganza to the throne. The Dutch, then, as enemies to the Spaniards, became friends to the Portuguese, who were likewise the enemies of the Spaniards. They agreed, therefore, to leave that part of Brazil which they had not conquered to the king of Portugal, who also agreed to leave that part which they had conquered, as a matter not worth disputing about with such good allies. But the Dutch government soon began to oppress the Portuguese colonists, who, instead of amusing themselves with complaints, took up arms against their new masters, and by their own valor and resolution, with the connivance, indeed, but without any avowed affluence from the mother-country, drove them out of Brazil. The Dutch, therefore, finding it impossible to keep any part of the country to themselves, were contented that it should be restored to the crown of Portugal; to which it has since belonged, giving title to the presumptive heir.

Geographers are not agreed as to the number of provinces or captainships into which Brazil is divided. Some have distributed it into three grand divisions: 1. The northern, containing eight provinces, viz. Para, Maranha, Siiara, Pata
gues, Rio Grande, Paraiba, Temara, and Pernambuco. 2. The middle division, comprehending five captainships, viz. Seregippe, Bahia, on the bay of All-Saints, Itanos, Porto Seguro, and Spiritu Santo. 3. The southern division, including three captainships, viz. Rio Janeiro, St. Vincent, and Del Rey. Others reckon fifteen provinces, viz. Para, Maranha, Siiara, Rio Grande, Paraiba, Temara, Pernambuco, Seregippe, Bahia, Porto Seguro, Spiritu Santo, Rio de Janeiro, Angra, St. Vincent, and Del Rey. By others again the whole of the Brazils is divided into eight independent governments, beside that of Rio de Janeiro, of which the governor retains the same name only of viceroy of the Brazils. The others are those of Para or Amazonas, Maranha, Pernambuco, Bahia, Santo Paulo, Matto Grosso, Minas Geraes, and Minas Goyazes. The red areiefs granted to some of the nobility, in recompence of their extraordinary services, who do little more than acknowledge the sovereignty of the king of Portugal, and his representative the viceroy of Peru, who acts both in a civil and military capacity, and maintains the state and grandeur of a foreign prince in the city of St. Salva
dore. Formerly a Bahia dos Todos os Santos, or St. Sal
dore, was the principal seat of government and chief mart for commerce in the Brazils; but the discovery and improvement of the gold and diamond mines, within about 100 leagues of Rio de Janeiro, and communicating immediately with it, gave a decided superiority to the latter. On the coast are three small islands, where ships touch for provisions on their voyage to the South Seas; viz. Fer
dando, St. Barbaro, and St. Catherine's. The bays, harbours, and rivers, are the harbours of Pernambuco. All Saints, Porto Seguro, the port and harbour of Rio de Ja
eiro, the port of St. Vincent, the harbour of St. Gabriel, and the port of St. Salvador, on the north shore of the river La Plata. "All the provinces of Brazil," says Sir George Staunton (Embassy to China, vol. i. p. 180.) "are growing fast into opulence and importance. They manufacture of late several of the most necessary articles for their own consumption; and their produce was so considerale, that the balance of trade became to be already in their favour; and remittances of bullion were made to them from Europe, in return for the overplus of their exports bey
don their imports." It appears, from the account of this writer, that the Portuguese settles have manifested repeated symptoms of revolt from the parent country. It appears also, that during the administration of the marquis de Pombal, so long prime minister in Portugal, these colonies were delivered from some monopolies and restraints, which had contributed to depress them; and, moreover, that the project of removing the seat of the Portuguese government to the Brazils was once, in fact, seriously in contemplation with this minister, when that country was invaded by the Spanish forces in 1761, and that calculations were made, and precau
tions taken, as to the number of vessels necessary to transport across the Atlantic the royal family, with the principal officers of the court, and their several attendants. But the project vanished with the danger that occasioned it; and the Brazils continued to be considered as a colony, de
tined, exclusively, to enrich the parent state.

The climate of Brazil has been described by two eminent naturalists, Piso and Margrave, who observed it with philosopohical accuracy, as temperate and mild, when compared with that of Africa. This they chiefly ascribe to the re
terminating wind, which blows continually from the sea. The air is not only cool, but chilly through the night, in
much that the natives kindle fires every evening in their huts. Niuhoff, who resided long in Brazil, confirms their description. The rivers in this country annually overflow their banks, and, like the Nile, leave a foot of slime upon the lands; so that the soil, especially in the vicinity of the rivers, is extremely rich. The northern provinces are subject to heavy rains and storms; but those of the south are more temperate and fertile. Among the vegetable productions of this country, we may reckon Indian corn, wheat, rice, manioc, sugar cane, coffee, cocoa or choc
date, indigo, pepper, cactus, on which is bred the insect fulminating cochineal, and the noted Brazilian tobacco. The red or Brazil wood, imported into this country, for the purpose of dyeing, is the property of the crown. To the chieft of succulent plants, we may refer those that are common to all the tropical regions of America, such as, besides the co
coa and chocolate nut, the plantain, the banana, palm, the yam, potatoe, caaava, together with many species of me
tons and gourds. The principal fruits are the pine apple, the mango, and the tamarind. The warm aromatic plants found here in a truly indigenous state, and much used by the inhabitants as condiments to their food, or as the basis of various drinks, are the orange and limes, the grapes, ginger, the turmeric, several species of pepper, American coffee, capicul or Guinea pepper, and the wild cinnamon, (laurna canella.) Several medicinal plants of high estimation grow here spontaneously, and in great abundance, such as the contrayerva, the Indian pink, the mchococan, the jalap, the amyris which yields the gum elemi, and the gui
cum. Besides the Brazil wood, this country furnishes for ornamenal use, or for the purpose of dyeing, logwood, suf
tie, mahogany, ebony, rose wood, fattin wood, and many others. Among its ornamental plants are the Brasilian myrt, the scarlet fuscia, and the amaryliss formosiflora. Brazil abounds with horned cattle, which are hunted merely for their hides, of which 20,000, it is said, are annually sent to Europe. These cattle are taken and killed, more for the sake of their hides and tallow than their flesh; though great quantities of the latter are applied to the use of such ships as sail from Pernambuco, Bahia, Todos os Santos, and Rio de Janeiro, to Guinea. The places which are chiefly frequented for procuring these cattle, are Rio Grande and Rio Paraiba, lying to the northward of Per
dambuco; and they are inhabited by Indians, called Ta
puyes; many of whom send annually large droves of cattle, through...
through the Tupique nation, which extends from the source of Rio St. Francisco in S. lat. 8° to that of Rio Deoce in S. lat. 20°, to Bahia Tudos ou Santos, and Rio de Janeiro, where they fell for 4 or 4 crucibles of a piece, (a crucible being in value about 35. 8d. sterling,) or exchange them for knives, hatchets, &c. or coats base, for a yard of which they will give a good baht. Among its animals, we may reckon several species of the armadillo or dafipus, the cat or fzs kind, the otter or lutra, the weal or mufels, the eposium or dimelphis, the porcupine or hy-}

trix, the cavy, the squirrel or feunus, the hare or le-

pus, the mufk or melculus, the deer or cervus, the hog or tus, &c. Among the fishes found on its coasts, and

in its rivers, are some species of the cachalot or phylæter, and the gorgias, bufet with spikes like a hedge-hog, &c.

Many of its birds are curious and beautiful, particularly some of the parrot or pratincaus kind, the toucan or ram-

phallos, the motmot or momotus, the palamedea or am-

ninga, with a thong nail or spur at each flexure of its

wings, and a horn about 6 inches long growing from its

forehead. The size and vivid line of the flowers in the

forests, and the gaudy plumage of the birds, are very striking.

Brazil breeds a variety of serpents and venomous reptiles;

among which are the Indian salamander, an insect with 4

legs, whose sting is said to be fatal; the ibiboboca, a spe-

cies of serpent, about 7 yards long and half a yard in cir-

cumference; the rattle snake of enormous size; and the

hobby, or roe-buck snake, which is said to extend to

the length of between 20 and 30 feet, and to be

2 or 3 yards in circumference, and which is capable, as

some authors have reported, of swallowing a roe-buck

whole. The hissing noise of this large and formidable

snake fts the bearer on his guard, and they seldom, with-

out provocation, advance to an attack.

The gold and diamond mines of Brazil were first opened in

1681; and our information concerning them is imperfect.
The former are situated in the mountains, from which flow various
streams north and south, which discharge themselves on one
side into the river Tocatint, and on the other into the Parana;
but there are mines of gold, as far inland as the river Cuy-
aba, which runs into the Paraguay, and even near the river
Yenas. Others are near the river Paise and Saguitinhon-
ha, the Riacho-Fundo, and Guarapara in St. Paul's.

One fifth of the gold is exacted by government, and the people
of Rio are prohibited from working up the gold of

their own mines, and the tools and instruments used for that

purpose are seized and confiscated.

The diamond mines are near the little river of Milho Verde,

not far from Villa Nova de Principe, in the province of Serro
de Frio, S. lat. 17° according to La Cruz, and W. long.
about 44°. These diamonds of Brazil are not of a fine water
as those of Hindoostan; being of a brownish and obscure hue;
and, supposing the weights to be equal, they are sold 10 per
cent. cheaper than those of the East. One of the largest dia-

monds that has been known, was sent from Brazil to the

king of Portugal. It weighed 1680 carats, or 128 ounces;
and it has been valued at 576,787,500. Some beautiful lapidari-

aries, however, have suggested, that this supposed dia-

mond is only a topaz. All the diamond mines belong ex-

clusively to the crown. The mines of gold and silver are said
to have yielded above five millions sterling annually; those of diamonds have been usually farmed at about 30,000l.
yearly, which is thought to be scarcely a fifth of their ac-

tual produce.

The trade of Brazil, notwithstanding the restraints

and impositions to which it is subject, is very extensive,
and continually increasing. This commerce is of such

importance to the parent state, that it could not sub-

tain without it. The confine of people who resort to the

Brasils from Portugal, and from other countries, has much

augmented the imports of gold, and, what is much more

important to Europe in general, the exports of the ma-

nufactures of this hemisphere. Great Britain supplies Bra-

sil with a variety of woolen manufactures; such as fine

broad medley cloths, fine Spanish cloths, scarlet and black

cloths, serges, duros, druggets, fagathies, shelleys, cambl-

ets, and Norwich stuffs, black Colchester bays, fays, and

long ells, hats, stockings, and gloves. Holland, Ger-

many, and France, have chiefly exported thither, fine hol-

lands, bone-lace, and fine thread; silk manufactures, lead,
black tin, and others articles are also sent from different

countries. England likewise trades with Portugal for the

use of the Brasils, in copper and brass, wrought and un-

wrought pewter, and all kinds of hard ware. By this ex-

tent of its trade, Portugal, instead of 12 ships usually
employed in the commerce with Brazil, employs at least 100

fail of large vessels, which are perpetually palling from one
country to the other. Brazil also carries on a considerable

trade with Africa in slaves, and thus Portugal occupies a

great number of ships. All these ships, employed in dif-

ferent branches of trade, go and return at appointed sea-
fons, under the direction of government, and under-con-

voy of a certain number of men of war; nor can a single ship

clear out or depart, without the fleet, except by a special

licence from the king, which is seldom granted.

But these restrictions, however, as well as the infatuated policy

of the country, it fails to derive that advantage from this extensive

commerce, which it is adapted to afford. The fleets fail in the

following order, and at the following stated periods: that de-

tined for Rio de Janeiro sets fail in January; the fleet to Ba-

lia, in February; and the third fleet to Pernambuco, in March.

The duties which the agents of Portugal levv upon the

importation of goods from Lisbon and Oporto at Rio de

Janeiro are 12 per cent., upon the value of each article.
The chief duties paid at Lisbon, on the commodities of the

Brasils, are as follow: upon gold, 1 per cent.; coffee, 8

per cent.; sugars, rice, and skins, 10 per cent.; indigo, 12

per cent.; planks, 17 per cent.; and rum, 4 dollars for
every pipe of 180 gallons. All large ship timber, as well as
the Brazil wood, is claimed as the property of the
crown. Yet, notwithstanding all monopolies, prohibitions,
and heavy taxes, the whole revenue from the Brasils is paid
not to be equal to a million sterling, of which the expence of
their government consumes about a third part. The
taxes are severely felt, especially in the interior provinces,
where the carriage and transit duties increase the price of
every article so enormously, that a bottle of port wine, for
instance, costs 15s. sterling to the consumer. The hard-
ships thus imposed by the mother-country, excite a spirit
of general dissatisfaction and revolt. Hence it happens,
that officers, both civil and military, who are natives of
Portugal, and also the ecclesiastics, soon change their ori-
inal affection for the parent state, into an attachment to
that where they are likely to spend their days, and are
sometimes tempted to sacrifice to their own interest, that of
their employers. It is observable, that whatever difficulties
the Portuguese may be likely to encounter, in securing
their American possessions against internal enemies, they
seem to have taken no mean precautions against any foreign
attack. See Rio de Janeiro.

The population of this extensive country has not been ac-
curately ascertained. Some have reckoned the Portuguese
and their descendants at half a million, and the natives at 3
or 4 millions. According to Sir George Staunton's ac-
count,
count, (Embassy to China, vol. i. p. 172.) all the whites are computed at about 200,000, and the number of slaves, born in Africa, or defended from such, is estimated at 600,000. Probably, the natives do not exceed one million. Labour is chiefly performed by slaves, of whom about 20,000 are annually imported, and of these, about 5,000 are usually sold every year at Rio. In the harbour of Rio, at a place called Val Longo, are warehouses for the reception and preparation for sale of the slaves, that are imported thither, chiefly from Angola and Benguela. This spot is appropriated to the purpose of cleansing, fattening, rendering flaky and saleable, and concealing the defects of this class of beings, who, it is said, seem little subject of the humiliation of their condition. The average price on importation is about 28l. sterling each. Before they are shipped from Africa, a duty of 10,000 reis a head is paid to the queen of Portugal's agent there; the whole amounting to about 60,000 a-year, which goes into her private purse, and is not considered as part of the public revenue. The plantation slaves in the Brails are allowed two days out of seven for their own purposes, which is a greater interval than that which is granted in the West India islands. They are supersedes for being addicted to stealing and lying; their disposition seems to be gay and active, and easily reconciled to their situation. They seldom recur to intoxication as a relief against any feelings of distress; and they are fond of music and dancing. Many of these slaves are the property of the crown, and of those, about 10,000 are employed in the diamond mines; several of them are attached to convents. The Benedictines alone had 1000 upon their plantations; some of these fathers observed, that the passing from the connection between the blacks and whites were generally endowed with much intelligence and ingenuity. Some of them they bred up carefully, and instructed with such success, that they thought themselves under no necessity of sending perons to the universities of Portugal for a liberal education: one of this mixed breed, as they boasted, having been promoted to a learned professorship at Lisbon.

The European settlers, in all classes of society, are much addicted to gaiety and pleasure; and though at Rio, in particular, there are three convents for men, and two for women, the austerity and self-denial intended by their original institution is little practised. Although the conquest of the country was at first profusely undertaken for converting the natives to Christianity, and ample endowments have been granted for this purpose, yet none of the friars now engage in the troublesome, unsafe, and, perhaps, hopeless enterprise. No inquisition or tribunal of the holy of office has been established in the Brails. Nevertheless, the ceremonies of religion are regularly observed, and even multiply at Rio. During the day-time, bells, and sometimmes fire-rockets announce, at every hour, the performance of some solemnity in the churches; after fun, the streets are crowded with processions; and at every corner is stuck up, in a glass-case, the image of the Virgin Mary, which receives regular homage from passenges. Men of the lower classes generally wear cloaks when they walk abroad; and those of the middle and higher ranks never appear without swords. The ladies wear their hair hanging down in tresses, tied with ribbons, and adorned with flowers; their heads being uncovered. In their visits to the churches, both at matins and vepers, they are very regular; at other times, they are generally seated at their balconies or windows. Many of them have fine dark eyes, and animated countenances. In the evenings, they amuse themseives with playing on some kind of musical instrument, chiefly the harpsi-

chord or guitar. Among the more innocent pleasures of both classes, are operas, plays, and masquerades, and assemblies in a public garden. In Brasil, the convents and monasteries are numerous, but the manufactories more rare.

The original inhabitants of the Brails have been found incapable of being reduced to a state of slavery, or even to the domestic habits of civil society. Children of these natives have been taken into Portuguese families, and pains have been taken, from motives of curiosity, or of humanity, to domesticate and instruct them; but their nature, it is said, is so intractable, that they constantly return to their original habits of savage life, without retaining any of the principles which might restrain their passions or caprices. These people, though poor, seldom offer themselves for hire, and are as seldom coveted by the Portuguese, except for rowing their boats, in which practice they are remarkably expert. In their persons they are generally somewhat under the middle size, muscular, stout, and active, with light brown complexion, black, strong, unruly hair, with very little beard, and large dark eyes, which discover no mark of imbecility of intellect; their aspect, upon the whole, indicates no trace of meanness or vulgarity; but their looks and expressions are intelligent and dignified. Their chief pleasure consists in hunting and fishing, and whilst they cherish an hereditary and implacable antipathy to the invaders of their country, they withdraw from the considerate settlements of the Portuguese, and manage individuals, without remorse, wherever they are found dispersed and unprotected. The coast between Rio and Bahia is still very much inhabited and frequented by them; and this prevents any regular communication by land, between these two places. The language of the indigenous Brails has not been investigated by the Portuguese; but that which is most widely diffused is the Guarani, or that of the Guaranees. They have no books in their own language.

As to the government of the Brails, each province has its respective chief, under the viceroy, but they receive their instructions from the court at Lisbon. They are annually appointed for three years, but continued at pleasure. Each district has a particular judge, from whose sentences an appeal lies to the superior tribunals of Rio Janeiro or Lisbon.

Brasil, or Brazil-Wood. Fernambouc Wood.—Sapum Wood. The tree which bears this important wood is the Cæsalpinia Crista. Linn. This wood is very hard, takes a high polish, and is so heavy as to sink in water. When chewed, it has a sweetish taste. It resembles in appearance red faduera; but is distinguished from it readily, by giving out its colour to water, which faders-wood does not.

Brazil wood is valuable for the beautiful orange and red colour in various shades which it furnishes to the dyer, and its analysis is of some importance. Boiled in water, it forms a fine decoction. The refidue appears black, but alkalies will fll extract much colour from it. Spirit of wine and ammonia also readily extract a colour which is of a deeper red than the preceding.

When sulphuric acid is added slowly to a fresh watery decoction of braiil wood, a small quantity of red precipitate falls down, and the clear liquor now assumes a yellow. Nitric acid produces a similar change, but the liquor is more of an orange. Molt of the other acids also produce a red precipitate, and leave the liquor of various shades of yellow and orange. The alkalies restore the colour of the liquor, but with a tendency to cimmon and violet-brown.

The action of the solutions of tin and of alum is the most important. Alum gives a fine red precipitate in great abundance,
BRASILIANUS, a species of Cerambyx, the thorax of which is crimson and ferruginous: wing-cases pointed, telfaceous, with three little glabrous yellow lines. Fabric. Inhabit Brazil.

BRASILIANUS, a species of Scarabeus, found in the dung of cattle in Brazil. The colour is deep black: shield of the head emarginate: wing-cases fringed.

BRASILIUS, in Ornithology, a species of Caprimulgus, of a blackish colour, varied with small white spots, and yellow: beneath, varied with black and white. This bird inhabits Brazil. The wings and tail are equal: area of the eyes yellow: bill and eyes black: legs white. Brazilian goat-sticker of Latham.

So. 1. B. birgatum, a shrub, from eight to ten feet high. Stem straight, near two inches in diameter, with a brownish grey bark, finely wrinkled. Branches alternate, growing near the summit of the stem. Leaves in tufts, near a foot and half long, pinnate with an odd one, on a pubescent reddish petiole. Folioles from fifteen to nineteen, about three inches long, on short petioles, oval-pointed, entire, or slightly angular, smooth, green, and shining above, villous at their edges. Flowers in terminal, branched racemes, very small, of a dull red colour. It is a native of St. Domingo, Jamaica, and Guiana, and, like the true Brazil (Catalpina), is used for dyeing red, but does not produce so fine a colour. Aubert relates, that its leaves bruised when fresh communicate to cotton a green colour, which soon becomes violet. It is said by Phimier, that its stem, if wounded, yields a caustic juice, which fixes an almost indelible spot upon whatever part of the human body it happens to fall. Described by L. Marcel from a dried specimen without flowers. 2. B. glabrum, differs from the preceding in being smaller, less proper to be used in dyeing, and in having its leaves perfectly smooth. It is a native of St. Domingo. A single female plant has been cultivated in the royal garden at Paris, which flowered in the beginning of November.

BRASIENSIIS, in Entomology, a species of Cicada, (Membracis Fabric.) The thorax of this kind has two horns, is spotted with white, and is produced behind beyond the length of the abdomen. Inhabits Brazil.

BRASIENSIIS, a fort of Gryllus (Acheta), that inhabits Brazil. Its general color is fuscous: wings tailed and longer than the elytra; back pale; tail ascending, and the length of the body. Fabric. &c.

BRASIENSIIS, in ornithology, a species of Falco, with yellow feet; body rufous, varitd with white and yellow dots; tail variegated with white and fuscous. Gmel.

Willingby and Latham describe this under the name of the Brazilian kite, being found in Brazil, where, we are informed, it is highly destructive to the domesticated poultry. It is as large as our common kite. The beak and claws are long, very sharp, and black; eyes with the irides yellowish. Buffon has described it by the name of caracara. The same bird is cirrus brevilatus of Brisson.

BRASIENSIIS, a fort of Psittacus, or parrot, that is found in Brazil. It is of the fize of a pigeon, of a green colour, with the face red, the temples blue, and the orbits of the eyes cincereous. Gmel. Whether it be distinct from the lesser green parrot of Edwards (Psittacus aureoannalis of Latham),

dance, inclining to crimson, and subduing slowly. The supernatant liquor also retains the original colour of the liquor, but a further crimson precipitate is yielded on adding alkali enough to decompose the album in solution. In this way, a fine crimson Lake and Carmine are sometimes prepared, which therefore confound of alumine, united intimately with the natural colour of the wood, a little heightened.

Nitro-muriatic acid, added to the decoction, separates the whole of the colouring matter, which falls down in great abundance, united with the oxvd of tin, and the liquor remains colourless. Even when the decoction has first been made yellow by an acid, as above-mentioned, the solution first reduces the original colour, and then precipitates it, as with the simple decocation.

The solutions of iron blacken brafal wood, flowing the presence of gallic acid.

Many of the other metallic solutions act similarly to that of tin, forming a precipitate of the metallic oxvd with the colouring matter.

The colour of Brazil wood, though very beautiful, is fugitive, and has the additional disadvantage of being readily darkened and rendered purple by alkalis, and therefore by soap. The colour is made permanent by acids, but is then changed to the shade of yellow; but it is peculiarly distinguished from kermes and madder, by having the original crimson restored by solutions of tin, after being altered by acids. Accordingly, the best practical dyers have employed acids and tin in their attempts to fix this beautiful colour. For further particulars as to its use, see the article Dyeing.

BRASILIA, in Ornithology, a species of Tanagra, of a scarlet colour, having the wings and tail black. Gmel. Inhabits Brazil, and other parts of South America. The specific names under which this beautiful bird is described by different authors are numerous; it is called Cardinal by Buffon, Cardinalis, Brisson. Merula brasilica, &c. Ald. Tye piranga, Maregr. Chiloth, Hier. Mex, &c. Latham names it the Brazilian Tanager. Its size is that of the common sparrow. It is conjectured, that Cardinalis nivosus, and Cardinalis torquatus of Drifton, are varieties of the first-mentioned species.

BRASILIANA, in Conchology, a species of Venus, that inhabits the shores of Brazil. The shell is lenticular, of a yellowish brown colour, with thin transverse dilatate frize; anterior depression, broad and bluish; posterior one of the same colour, and heart-shaped. Bonn.

BRASILIANA, in Ornithology, a species of Strix, the Brazilian owl of Latham. The body above is pale and ferruginous, brown spotted with white: beneath white, with ferruginous brown spots. Gmel. This is of the size of a thrush: bill, irides, and the feet (which are short) together with the toes, yellowish. Called by Drifton Ato abrassinis.

BRASILIANA, a species of Procellaria, the Brazilian petrel of Latham, Buffon de Breuil of Buffon; and majusc of Ray. The colour is blackish: throat yellow.

BRASILIANA, a species of Certhia, described by Latham under the name of the black and violet creeper. The colour is black, with the crown of the head golden green: rump, chin and throat, violet: breast purple, inclining to chessnut. Gmel. &c. Length of this bird 5½ inches. This is Le Guitt-guit noir et violet, of Buffon. Inhabit Brazil.

BRASILIANORUM, in Entomology, a species of Apis, that inhabits America. This kind is hairy, and bluish black: thighs at the base black. Fabric. Obs. The beak is cunea, or rather subulate: eyes black: antennae above fuscescent, beneath telfaceous: jaws black, and hidodentated: thighs telfaceous, glabrous, and compressed: shanks, and soles of the feet, with telfaceous pile.
BRASILISI, a species of Alcedo, the plumage of which is variegated with rufous, chestnut,fuscous, and white; beneath white; greater quill feathers and tail rufous, with transverse spots. Gmel.

This bird is of the size of the common European king’s fisher: the bill and eyes are black; band across the eyes, with the legs and claws, brown. Buffon calls it gip-gipgip. It is idios Brasilisius of Brifion; and the Brazilian king’s fisher of English writers.

BRASILISI, a species of Merops, of a fine red colour, variegated above with fuscous and black; wings and tail pale blue. Gmel. &c.

This is the Brazilian bee-eater of Latham; merops rouge et bleu of Buffon; opisiler Brasilisius of Brifion; and pega Brasilisius of Seba. The length of this bird is nine inches. As the same implies, it is an inhabitant of Brazil.

BRASILISI, a species of Anas, called by English writers the mareca duck. The color of its plumage is fuscous; beneath chestnut and glossy, between the eyes and back is a yellowish or ochraceous spot; chin white; tail wedge-shaped and black. This is a native of Brazil.

BRASILISI, a species of Ardea, with a smooth head; body blackish, dotted with yellow; quill and tail feathers, with the bill and legs, blackish. Gmel. Briff.

This is a bittern of large size, measuring two feet eight inches. Brown, in his Natural History of Jamaica, calls it the chucking hen. It is named foco by Maregraave: by Buffon, ombre des bois. Inhabitats Brazil and South America in general.

BRASILISI, a species of Emberiza, described specifically by Gmelin, as having the crown, collar, and body beneath yellow; back, wings, and tail greenish, variegated with fuscous and yellow. Inhabitats Brazil; its size that of the common (parrow). Latham names it the Brazilian hunting. Ray has it under the title of girum becogata. It is le girungata and brouant du Broyel of Buffon.

BRASILISI, a species of Turdus, of a black colour, beneath rufily yellowish; rump ferruginous; tail somewhat wedged, and having the outer feathers totally white, and the ruff white only at the tips. Gmel. Of. Across the wings is a white stripe; legs brown.

This is the yellow-bellied thrush of Latham.

BRASILISI, a species of Tanagra, of a small size, being about six inches in length, that is found in Brazil. The general colour is black, beneath white; throat and rump blue; face and breast black. Gmel. Of. The beak is blackish; head blueish. Called by Latham turpinje tangur. Maregraave has it under the name of girur gira: and Buffon, thole of turpin and tangure bleu du Broyel.

BRASILISI, in Zoology, a species of Rana, or toad of a yellowish ash colour, with waved red spots; beneath glabrous. Linn. Inhabits Brazil.

BRASILISI, in Geography, a city of Lithuania, in the palatinate of Wilna, on the side of a lake, which communicates with the Dvina: 76 miles N.N.E. of Wilna. N. lat. 55° 45', E. long. 22° 22'.

BRASMA, in the Medical Writings of the Ancients, a name given by Dioscorides and others to a light, empty, and good for nothing kind of black pepper. This was no peculiar species of pepper, but, as John Bauhine has well observed, it was the same with the pepper we now frequently meet with, which has decayed upon the plant. Dioec. Lib. ii. cap. 128.

Gg cold
cold water, which divides it into very small rounded shot-like fragments. Powdered charcoal is put over all, and the crucibles are covered and luted up. The brafs furnace has the form of the frustum of a hollow cone, or a cone with the base downwards, and the apex cut off horizontally. At the bottom of the furnace is a circular grate, or perforated iron plate, coated with clay and horse-dung, to defend it from the action of the fire. The crucibles stand upon the circular plate, forming a circular row with one in the middle. The fuel, which in England is coal, is thrown round the crucibles, and is thrown into the furnace at the upper part of it, or the truncated apex of the cone. A perforated cover, made of bricks or clay, and kept together by iron bars, is fitted to this opening. This cover serves as a regilier to regulate the heat; so that when it is to be increased, the cover is to be partly or entirely removed, and a free draight admitted to the external air, which passes along an underground vault to the ah-hole, through the holes in the circular grate between the crucibles, and through the upper mouth, along with the smoke and flame, into an area, where the workmen stand, which is covered by a large dome with a chimney to conduct the smoke out of doors. To diminish the heat, the regilier cover is put on the mouth of the furnace, leaving thereby no other exit for the smoke and flame than the holes of the cover. The time requisite for heating the crucibles varies considerably in different works, being determined chiefly by the nature of the calamine or other ore of zine employed, and also by the size of the crucibles. In the great way, at least ten or twelve hours are required. At Holywell about twenty hours are employed.

During the process, and especially towards the latter end, part of the reduced zine which escapes, being absorbed by the copper, finds its way in vapour thorough the crucible lids, and burns around them with the beautiful blue flame and white smoke peculiar to this volatile metal.

The heat required for brafs-making is somewhat less than what is necessary to melt copper, for brafs is more fusible than copper, and the zinc is able to penetrate copper when kept at a full red heat. When the brafs is judged to be made, the heat is increased to fuse the whole down into one mass at the bottom, and the crucibles are then removed, and the melted brafs poured out into moulds. At Holywell, fix crucibles are used to one furnace; and the quantity of brafs procured from them all is sufficient to fill one of them. This makes a single large brafs plate, which is manufactured in the same way as copper plate. Or, more accurately, from forty pounds of copper and sixty pounds of calamine, about sixty pounds of brafs are obtained, besides that a considerable quantity of zinc burns off in the process above-mentioned.

The above is the usual process of making brafs in most parts of England; and is essentially the same wherever this alloy is manufactured, but with some variation as to the choice of ingredients, their proportions, the time of fusion, and other smaller circumstances. In Gollari in Saxony, instead of a native calamine, the calamine, or sublimed oxd of zinc is used, which is collected in a particular part of the chimneys of the reverberatory furnaces, in which the lead ores and blastes are roasted. The proportions of the ingredients also vary considerably. According to Swedenborg, they are, in Gollari, 30 parts of copper, 40 to 45 of calamine, and twice the volume of charcoal; in many of the manufactories in France, 35 of copper, 35 of calamine and 20 to 25 of charcoal; in Sweden, 30 of copper, 20 to 30 of old brafs, and 40 of calamine, with charcoal sufficient; or 40 of copper, 30 of old brafs, and 50 of calamine; in this country, generally about 40 of copper, and 60 of calamine. The product of brafs varies also; but it seems to be in few places so great as in some of the works of England, where, as already mentioned, 40 pounds of copper increase to 60 pounds of brafs. This superior quantity is ascribed to the kindling to which the copper is previously reduced by pouring it melted into water, which, it seems, is not always practiced elsewhere, and probably too to the goodness of the calamine.

At Stolberg, near Aix la Chapelle, where brafs is made to a very great extent, the furnaces are cylindrical, and each contains eight crucibles arranged in two tiers of four each. The crucibles are fifteen inches high, twelve inches deep, and eight or nine wide. The proportions are 40 pounds of copper, 65 of calamine, and double its volume of charcoal. After the fire has been kept up for twelve hours, a workman takes off with an iron trowel all the fume and charcoal which swim upon the liquid, and when cooled form, a mass called arkel. This, examined by a glafs, is found to consist of calamine and copper particles cohering together, but not completely united. The brafs resulting from this first process is coarse, brittle, and unequal in texture, and requires a second fusion, before it is fit to be wrought. For this purpose the same crucibles are again employed, and are filled, fill with three handfuls of the mixture of calamine and charcoal, over which are put two or three pounds of the impure brafs broken in pieces, then more calamine and charcoal, with a piece of the arkel, and over all the calamine and charcoal powder. They are then heated strongly for two hours, after which the brafs is fit to be cast into plates.

A single fusion, where the fire is kept up long enough, and the materials are good, is certainly sufficient to make good malleable brafs; but it is probable, that the finest brafs undergo a second operation with fresh calamine and charcoal. Some secrecy is, however, observed by those individuals who have the reputation of making the very finest article. In the laboratory, by way of experiment, brafs may be made in a much shorter time by using the same materials, that is to say, copper-shot buried in a mixture of calamine and charcoal, putting the crucible in a wind furnace, and heating slowly for half an hour, till the zinc begins to burn off in blue flame round the edge of the crucible, and then raising the fire, and heating briskly for an hour longer. This process of cementation of copper is also shown very neatly by a somewhat different management; as given by Cramer. Put the mixture of calamine and charcoal into a crucible; cover it with a thin layer of clay, over which, when dry, lay a thin plate of copper, and cover the whole with fine charcoal powder, and a luted cover to the crucible. Apply heat gradually, and the vapour of the reduced zinc will rise through the floor of clay, will penetrate the red-hot copper above it, and convert it gradually into brafs, which, at the end of the operation, will be found lying melted upon the stratum of clay; and the increase of weight, which the copper will be found thus to have gained, will afford a good practical test of the goodness of the calamine, and its fitness for brafs-making in the great way.

Brafs is wrought into plates by casting and laminating. At Stolberg the plates are first cast into a mould formed of two blocks of hard granite five feet long, three and a half broad, and eight inches thick. These are placed one above the other, and the upper one is raised by a pulley, and smeared with cow-dung previous to casting. To give the plate the requisite thickness, hoops of iron of different dimensions are adapted to the under stone, so as to confine the melted metal, and regulate its thickness. The stones

are
are gently inclined before the metal is run into them. Their plates are afterwards laminated and manufactured in a thousand different ways.

The most important properties of brass, compared with copper, are the following: its colour is much brighter, and more approaching to gold; it is more fusible than copper, as is seen from the circumstance, that less than a copper-melting heat is sufficient for the making of brass; it is less subject to rust, and to be acted on by the vail variety of substances which corrode copper; and lastly, it is equally malleable when cold, and more extensile than either copper or iron; and hence peculiarly fitted to be made into wire. Brass, however, is only malleable when cold. By hammering, brass is found to become magnetic, perhaps only from the iron of the particles hammer which may have been broken into its surface; but this makes it necessary to use the hammered brass about compass-needles, and similar magnetic apparatus. The expansion of brass has been very accurately determined, as this metal is most commonly used for mathematical and astronomical instruments, where the utmost precision is required. Mr. Smollett found that 12 inches in length of call brass at 32°, expanded by 190° of heat, (or at the boiling point of water,) 225 ten thousandth parts of an inch; brass wire in the same circumstances expanded 323 parts; brass 16 parts, with one of tin, expanded 229 parts. The expansion of hammered copper is only 204 parts, but that of zinc is 353; so that brass holds a middle place in this respect between its two component metals.

The zinc is readily separated from brass by fire. When brass is heated strongly in open vessels to at least a copper-melting heat, the zinc of the brass takes fire, and slowly burns away. If this is continued long enough, little else is left but copper, though still containing a small portion of zinc, which no further continuation of the heat will entirely separate.

Some kinds of very fine brass, it is said, are not by cementation in the way already described, but by a more speedy and direct union of copper and zinc, care being taken to prevent the access of air to the materials while in fusion. Very fine brass may also be made in the same way, (and doubtless all in manufacture,) by mixing the oxides of copper and zinc, and reducing them together. This plan is ingenious, and the intimate mixture of the two metals, the great object in brass-making, is probably more accurately obtained in this way than by the common processes of cementation. The following experiment on this plan is given by Sage: Mix together 50 parts of oxide of copper, remaining after the distillation of verdigris (which is a very pure oxide) with 100 parts of basis calaminaris, 400 parts of black flux, and 30 parts of charcoal powder: melt together, till no longer any blue flame is seen to burn round the top of the crucible. When cold, a fine button of brass is found beneath the fœmin, weighing a fixed more than the copper obtainable from the oxide of this metal reduced in the same way, but without the calamine. This brass has a very fine colour, like gold. On this experiment M. Sage observes, that a fixed increas of weight gained by the copper, is the proportion which constitutes the fixed brass, and that which copper will always retain, however long kept in fusion, provided the access of air is prevented, as in this case, by the alkaline fœmin. When the copper retains a fixed of zinc, the colour is not so fine; and any quantity above a fixed will be expelled by the heat, even when the alloy is covered: and, on coming to the air, the zinc will burn. Hence the cellation of the zinc flame is in this experiment the proof, that the copper now retains no more than a fixed of zinc, and is fine brass.

The analysis of brass is a point of some consequence, and several methods have been proposed, some good, others defective.

Brass may, in some degree, be analysed by strongly heating in an open vessel, as above mentioned. The zinc then burns off, and when no more flame is given out, the copper is supposed to be pure. But Dizé has found that this mode is very uncertain, so that no two alloys of the same sample are compared, for it is not easy to tell when all the zinc is burnt off that can thus be volatilized; and the increase of weight, caused by the oxidation of part of the copper, throws a further uncertainty on this method.

Neither will a simple fusion of brass in the sulphuric or any other acid, and crystallization, answer the purpose; for, though much of the crystallized sulphur of copper may readily be picked out from the sulphate of zinc, the perfect separation of the two kinds of crystals is impracticable, and at last one species becomes mixed with a portion of the other, even in the respective crystals.

M. Dizé proposes the following methods:

1. Dissolve the brass in nitric acid, which takes up the copper and zinc, and leaves any tin with which it is often alloyed. Decompose the clear nitrat solution by potash, redissolve the precipitate in sulphuric acid, and add a piece of clean bright iron to the solution, previously diluted with a fix part of water. The copper is thus precipitated in the metallic state, and the solution now holds sulphate of iron, and sulphate of zinc. Thence M. Dizé proposes to separate by gallic acid, which flows precipitates the iron, and leaves the zinc. Lastly, the sulphate of zinc may be decomposed by a carbonated alkali, and the quantity of zinc in the carbonat may be estimated according to proportions, which will be presently mentioned.

This method is useful, but the separation of the iron from the zinc by the gallic acid, is exceedingly tedious. Sulphured hydrogen gas would be much shorter, and to be preferred.

2. Dissolve brass in nitric acid, dilute with fix parts of pure water, and immerse in the solution a cylinder of bright clean lead. The copper speedily separates in the metallic state round the lead, which last takes its place in the solution. As this advances, the liquor looses its blue colour; and when all the copper is separated, it becomes slightly yellow. To determine, however, whether all the copper is separated, add a fresh piece of lead, and boil the solution for some time. This now contains nitrat of lead, and nitrat of zinc. Sulphuric acid will precipitate thence the lead in the form of an infusible sulphate, and the nitrate of zinc may then be decomposed by a carbonated alkali. On this precipitation, however, there are some observations to be made. Copper, when dissolving in nitric acid, absorbs nearly 7/8 of its weight of oxygen; but lead, under the same circumstances, absorbs only 1°. Hence (as Vauquelin remarks on this subject in the analysis of brass) 100 parts of copper dissolved in nitric acid would require, for their dioxygination, (which takes place whenever one metallic oxyd in solution is precipitated in a metallic form by another metal immersed in it,) full 250 parts of lead, which last is of course oxidised in proportion as the copper precipitates in the metallic form. But this large quantity of oxyd of lead cannot be held in solution by the nitric acid, except this is largely in excess; and this explains why, as M. Dizé has observed, a portion of oxyd of lead is apt to form at the latter end of the process, and to mix with the copper, so as to require a subsequent operation to get the copper free from it. Nor will an excess of acid ensure the purity of the precipitated copper; for M. Vauquelin finds that...
if 50 grains of pure copper are dissolved in nitric acid to excess, and then precipitated by metallic lead, of which about 220 grains are requisite, the cuprous precipitate weighs 1.8 grains instead of the original 50 grains, and therefore is not pure copper, but an alloy of this metal, with a very large proportion of lead. This method, therefore, of analysing brafs is highly erroneous, unless the supposed copper precipitate be separately treated, in order to free it from the large proportion of lead with which it must be mixed.

The following methods are given by Vauquelin:

1. Dissolve a given quantity of brafs in nitric acid, put it in a well-closed bottle, and add caustic potash to excess, so that there shall be a sensible alkaline taste in the liquor; filter the mixture well, and keep it a short time in digestion.

By this simple process the oxyd of copper is precipitated by the alkaline, but the oxyd of zinc is re-dissolved in it; and if the liquor be now filtered, the alkaline solution of zinc passes through clear, and the oxyd of copper is left behind. This oxyd is brown, and nearly metallic in appearance. When thoroughly washed, and gently dried, it contains 65 per cent. of metallic copper. If one is assayed by a previous affray, that the brafs only contained copper and zinc, when the quantity of copper is thus obtained, that of the zinc may be inferred from the difference between the copper, and the weight of the brafs employed; or else the alkaline solution of zinc may be super-fattuated with sulphuric acid, so as at first to precipitate, and afterwards to redissolve the zinc, after which this metal may be precipitated as a carbonat, by adding carbonat of pot-ash or soda.

A very trifling quantity of copper passes into the alkaline solution of the zinc, occasioned by a small portion of ammonia formed by the nitrated metals when the caustic alkali is added, which takes up this atom of copper. If necessary, the copper might be again precipitated by heating the alkaline solution, so as to expel the ammoniac; but not to boiling, otherwise some of the zinc would separate from the alkali, and cause a greater error.

2. Dissolve brafs in sulphuric acid, dilute with 20 times as much water, and immerse a flint of zinc exactly weighed. The copper soon precipitates completely in the metallic state, which is to be well washed and weighed. The solution now contains only the zinc of the brafs, and the zinc dissolved out of the flint of metal immersed. By weighing the undissolved flint of zinc, and precipitating the whole by carbonat of pot-ash or soda, an easy calculation will give the portion of zinc belonging to the brafs: or, more briefly, this may be inferred from the copper obtained, and the quantity of brafs originally employed.

It only remains, on the subject of analysis, to give the metallic contents of carbonat of zinc. Dize dissolved 100 parts of zinc in nitric acid, precipitated it by carbonated soda, and this product, well washed and dried, now weighed 180 parts. Hence 100 parts of carbonat of zinc thus obtained, contain 55.5 of metallic zinc.

On the other hand, Vauquelin found that carbonat of zinc obtained from the sulphat by carbonated pot-ash, well washed and calcined in a crucible to expel all the carbonic acid, contained 69 per cent. of metallic zinc. Hence the carbonat obtained by Dize, it is obvious, must only have been dried at a low temperature, probably that of boiling water; and from either of the above data the quantity of zinc may be estimated; or else the carbonat or oxyd may be mixed with charcoal, and strongly heated in an earthen retort, without the access of external air, by which the zinc will be reduced, and will distil over, and condense in the cool neck of the retort in the metallic state.
Leoncini, two celebrated professors at Ferrara, but finished his studies at Paris. On his return, he was made physician to Hercules II. his sovereign, to whose daughter he dedicated one of his works. As he soon came into great request in his profession, and had acquired considerable knowledge in botany, and other parts of natural history, to which he had, in a particular manner, turned his attention, he was able, from his own experience, to correct several errors of his teachers, on the nature and qualities of drugs. The chief work by which he became known, is "Examen omnium simplicium medicamentorum, quorum unus in publicis officinis cit." Rome, 1536, fol. This work has been frequently re-printed. In the course of it he examines the qualities of some poisonous drugs, and affects on dogs, and other animals. He twice saw a cartilage, he says, of the form of a crofs, in the hearts of two flags. He had received manna from Syria, but preferred the Calabrian. He flew on which calcined mercury had been early given in the cure of the lues venera, though then diffused. "De medicamentis tam simplicibus, quam compostis, quae unico humori sunt propria," Figur, 1555, 8vo.; containing many valuable observations, principally from experience, on the effects of various purging medicines. He effected the cure of a maniacal complaint, in a person of rank, by the use of black helkbore, which had been many years diffused and proscribed. "Examen omnium syruperum, quorum publicus unus cit," Lardini, 1540, 8vo. This, as well as several other of his works, is written in the form of a dialogue, between himself and an apothecary. In the commencement, the apothecary gives an account of his manner of treating his wife, from whom he exacts the fame implicit submission that Petrucho requires from Catherine, on their wedding-day. When retired to their chamber, he says, he threw a pair of breeches on the ground, and giving his bride a flick, similar to one he held in his hand, infilled on her contending with him who should thereafter wear them; and having then conquered her, he had taken care to keep up his authority. The doctor reproves his guilt, and gives him some good rules for his future conduct. He afterwards, and in succession, published "Examinations of the compositions of eluates, pills, lozenges, trochilis, &c." besides "Commentaries on parts of the works of Hippocrates," "A Complete list of Galen's works," "A Treatise on the veneral disease, on the use of China root, guisicum, &c." in all of which he has many original observations. He died, according to Carrere, in 1554.

His son, BRASSAVOLA, JERON, published, in 1550, "De officinis medicis libellus," 4to, Ferrara. In this he treats largely on the duties of physicians, on their conduct in consultation, on the signs from which the prognostics in diseases may be drawn; also, "In primum Hippocratis aphorismorum librum expostilio," 4to, Ferrara. Haller, Bib. Med. Botan. Eløy Dist. Hilt.

BRASSE, in Ichthyology, a species of PERCA.

BRASSI, in Geography, a town of France, in the department of the Nievre, and chief place of a canton in the district of Clamaç; 10 miles E. of Corbigny.

BRASSICA, in Botany, is derived from C. Brouinie from βρλθθβ or βρλθθαν, which he says signifies to devour, because it is eagerly eaten by cattle; but this is a fene in which the Greek word does not appear to be used by ancient writers. Linnaeus derives it from the same word, and rightly rendering it to boil, supposes the plant is so called from its being a common pot-herb. Sculliger conjectures it is nally written πρλθραν from πρλθραν, a dish or garden. But as the word was not known to the who first called the plant from which Linnaeus as the genus πρλθραν; and afterwards πρλθραν, it is probably of Latin origin. By Varro and Festus it is derived from πρλθραν, on account of its being cut off from the stem. This feems forced, and the etymology must be allowd to be altogether uncertain. Lin. gen. pl. 320. Recchi. 881, Schreb. 1685. Jull. 236. Gartt. 443. Tab. 143. La Mareck Pl. 356. Smith Flor. Brit. 311. class. tetradyiinara filipouta. Nat. ord. filopouta or crucicina. Cruciferis, Jull.

Gen. Char. Peribach four-leaved, erect, a little converging. Leaves lanceolate-linear, concave channelled, gibusous at the base, erect, parallel, distinct. Cor. four-petalled, cruciform. Petals subovate, flat, expanding, entire, gradually delineating into claws about the length of the calyx; nectariferous glands four, ovate, one between each of the shorter flaments and the pill, and one between each of the longer flaments and the calyx. Stam. Filaments six, ovate-flattened, one of which two opposite to each other are the length of the calyx, and four longer. Authors erect, acuminate. Pbįl. gern, columnar, the length of the flaments; stye short, the thickest of the gern: stigma capitato, entire. Pericarp. Siliqua long, rather round, but flattened on each side, and in some species quadrangular, two-celled; partition prominent at the apex, two-valved, valves shorter than the distillation. Seeds many, globular.

It is dilluting from filipina by its firm and close calyx, and from raphanus by its siliques not being articulated. Its distinctive character is however very obscure, and some of its species might be referred to other genera.

S. Siliques slender, four-angled, with a very short permanent style.

Sp. 1. B. orientalis, Linn. persplicata, La Mareck. "Stem leaves cordate, embracing the stem, smooth; root leaves, rough, very entire." Root annual, spindle-shaped, small, white. Stem generally branched at the base, about a foot high, round, smooth, glaucous. Leaves glaucous, very entire, obtuse: root leaves obviate; stem leaves alternate: flowers small: petals white or yellowish, narrow: siliques very long, erect. A native of Spain, France &c. and rarely in England on the coasts of Suffolk, Essex and Suffolk. 2. B. auriculae, Joquin Anvill. Tab. 243. "Leaves cordate, embracing the stem, very entire, smooth. Siliques deeply furrowed." Distilling from the foregoing by its furrowed siliques and yellow flowers. Willden. Dr. Smith deems it only a variety of the former. Corn-fields in Austria and Thuringia. 3. B. campferis, Linn. "Root and stem slender, leaves cordate-acuminate, embracing the stem; lower leaves lined, toothed, somewhat bifid." Smith. Root annual, spindle-shaped, small. Stem erect, branched, round, smooth, rather glaucous: upper stem leaves alternate, very entire, smooth: lower a little toothed, lowatif and especially the root ones, toothed, toothed, and waved, hispid beneath at the veins; all glaucous, and paler beneath. Leaves of the calyx scarcely cohering, a little spreading. Petals yellow, three times larger than those of the orientalis. Siliques erect, round, obsolescent quadrangular, circularly veined, torenhife, with an awl-shaped back, quadrangular at the base, fringed. A clearly distinct species. Smith. A native of Europe, and plentiful in some parts of England. La Mareck considers both the campferis and the auricula as varieties of the orientalis. 4. B. arvensis, Linn. Mant. "Leaves embracing
BRA

The first five species are cultivated merely for curiosity. They should be sown early in the spring, on a bed of light earth, and when they are sufficiently grown, thinned, but not transplanted. They will flower in June, ripen their seeds in August, and afterwards sow themselves, requiring no further care except weeding. Those species that are cultivated in the garden or field, for the use of the kitchen or cattle, or for other purposes, are the B. Napolé or Navar., under the name of coleole or rape, (see Coleseed) a variety of the B. rapa, or Turnip, (which is the) cabbage; the cauliflower; and broccoli; the turnip cabbage and turnip-rooted cabbage. We may here observe that the cabbage has been reclaimed from its wild state, and cultivated as a valuable succulent vegetable, from the remotest antiquity. It was well known to Theophrastus, and is mentioned...
tioned by all the succeeding Greek and Latin authors who have written on the natural history of plants, or on subjects of rural economy; but, like all other cultivated plants, it has gradually undergone so many changes, and assumed so many permanent varieties, that it is not easy to form a description which will apply to the whole. We may, however, observe in the general, says Duchesne, who has written a particular treatise on it, that it has always a flabby, cylindric, ascending caudex; a branched, smooth, and leafy proper caulis or stem; alternate, smooth leaves more or less green, or tinctured with red or violet; the lower ones petiolate, runcinate at their base, and more or less finate; the upper ones simple, smaller, and often embracing the stem; and flowers rather large, yellow or nearly white, in upright, loose, and terminating racemes, succeeded by nearly cylindric siliques.

The numerous varieties are divided by Mr. Miller into three grand families. 1. Those which grow in a natural way, without forming the leaves or stalks into a head, comprehending the wild colewort, the green colewort, the borecoles, and the turnip cabbage. 2. Those which form their leaves into a head, and to which the English gardeners exclusively apply the term cabbage. 3. Those which form their stalks into a head, as the cauliflower, and the different kinds of broccoli.

Duchesne throws them into six divisions. 1. The wild colewort, unaltered by cultivation. 2. The improved kinds, which do not form a head, or undergo any remarkable change in the stalk or root. 3. The proper cabbages. 4. The cauliflower. 5. The turnip-cabbage. 6. The turnip-rooted cabbage.

I. The wild colewort unaltered by cultivation.

Our English botanists agree in considering the sea cabbage, the maritima arborea f. procer. ramosi maritima of Morison and Ray's Synopsia, as the parent stock. But Duchesne places this plant under his second division; though rarely with little propriety, for he allows, at the same time, that it grows wild on the coasts of England and France. Notwithstanding this incongruity, the arrangement is implicitly adopted by La Marek and Boce. Ray affirms that the sea cabbage is perennial, and supposes (Hist. Plant.) that the brassica rubra vulgaris of John Bauhin is only a land variety of it. Hudson, Robson, Wither., (1st edit.) and even Dr. Smith make it biennial. Miller, who, according to Mr. Martyn, seems to confound it with the napo-brassica or turnip-cabbage, says, that it grows naturally on the sea-shore near Dover; that it has a perennial branching stalk, in which it differs from all the others; that the leaves are inclining to a purple colour, and are placed alternately on the branches, (exactly agreeing in this respect with the description given by J. Bauhin). He infers that it is a distinct species, having always found the seeds to produce the same plant, with this difference only, that in good ground the stalks will be much stronger than in poor; and adds, that the young shoots, after they are much frozen, are very sweet and good, but at other times are strong and stringy. He observes afterwards, that the perennial colewort is little cultivated in the gardens near London, as not being so good for the table, unless in very hard frost; though it is very hardy, will grow two years before it runs up to seed, and will afterwards produce many side shoots, continuing in poor land three or four years, but in rich soil not so long. La Marek and Boce, adopting the description of Duchesne, confirm the opinion of Ray and Miller. In France several other kinds have been grafted on this stock; and though the produce has not been of long duration, it has always been very remarkable. Upon the whole, it seems probable, that the perennial colewort of Miller is the only improved variety of the sea-cabbage, and that the French botanists are right in seeking for another origin of our common cultivated biennial kinds.

The plant which Duchesne thinks the parent of the common garden colewort, the borecoles, true cabbages, &c. is what he calls brassica nebraca armata, which he describes as growing from a small, fibrous tap-root, about 15 or 18 inches high when wild, but rising to the height of four or five feet when cultivated, and having a branched stem, with small flattened leaves more or less deeply divided; the lower ones lycr-shaped, the stem ones heart-shaped, elongated and fleshy. It is much cultivated in the Netherlands, and especially about Lille, for the use of cattle, and for the sake of an excellent oil compressed from its seeds, which must not be confused with the oil of the navv, or rape oil of England. It is sown in July, should be transplanted about the middle of September, and ripens its seeds about the middle of the July following. If designed for cattle, it should be sown in June, and the leaves may be plucked in October; but as it is hardy, it is better to preserve it till other kinds of green forage begin to fail. After winter, if its stem be cut some inches above the ground, it will produce a second crop of leaves for spring use.

II. Of the cultivated improved kinds which do not form a head, or undergo any remarkable change, either in the stalk or root, the principal are the common green colewort, or Dorsetshire kale of the English gardeners; and the borecoles or curled cabbages. The common green colewort is cultivated in France, and in some parts of England, to feed cattle and sheep, but is not used in the kitchen till it is tendered by frost. It is nearly superceded in the gardens about London by the sugar-loaf cabbage plants, which, from December to April, are the sweetest greens yet known. The borecoles are more esteemed than the common colewort, as being more delicate and equally hardy; but like it they are tough and bitter, till they have been exposed to frost. (See the next article.)

III. The proper cabbages, whole leaves form a head.

The effect of cultivation upon this variety is confined to the lower leaves, which are large, roundish, and nearly entire; and are set far to together, that they lie upon each other like the scales of a bulb; and increasing in compactness as they increase in size, prevent, for some time the development of the flowering stem, and its branches. (See the next article.)

Cabbages were a favourite excellent vegetable with the Romans; and as the late excellent Mr. White has observed, must have been known, in some of their varieties, to our Saxon ancestors, since the month of February was called by them frountales. They are still in universal use, but are often productive of flatulence and indigestion. The winter cabbages are most wholesome, especially when they have been tendered with frost. They are said to be improved in this respect at an earlier season, by being kept some time after they are gathered, and suffered to wither a little before they are dried. An agreeable pickle is sometimes made of them, by cutting them into six or eight pieces, according to their size, putting them for a few moments into boiling water, and then plunging them in vinegar, which, especially at first, should be occasionally changed, swarming in a little salt each time. In this form they are an excellent antiscorbutic, and are found a valuable sea-fare. The Germans and other northern nations have a still more salutary and pleasant preparation, which they call four-croot. With an instrument made for the purpose, they cut the head of a large variety (brassica capitata maxima) into small shreds,
and then lay them on a cloth to dry in the shade. They afterwards put these shreds into a common cauldron open at one end, and if it has contained wine or vinegar, it will be more favourable to the necessary fermentation: otherwise the middle should be rubbed with a little leaven of old four-croute. The cover of the open end should be strong, that it may contain a large weight, and should have a handle fixed in the middle that it may be readily put on and taken off. A quantity of very fine sea salt should be procured, in the proportion of two pounds to twenty cabbages. A layer of this salt is first evenly spread at the bottom of the cauldron, and this is placed a layer of the shreds six inches thick. A man in strong boots, well washed and very clean, then puts into the cauldron, and treads down the maff till it is reduced to the thickness of three inches. Similar layers of salt and shreds of cabbage are put in and trodden down in their turn, till the cauldron is nearly full, but the last layer must be of salt. Some large fresh cabbage-leaves are then laid on, and covered with a wet cloth; and on the cloth is put the cover of the cauldron. The shreds of cabbage are pressed down by heavy weights, to prevent the evaporation from swelling and rising during the time of its fermentation. A fennel, or juniper berries, or, which is much better, a caraway seed, is mingled with the cabbage, but not with the salt, and an empty space of about two inches is left at the top. The shreds are soon deprived of part of their vegetable juice by the pressure. This juice, which naturally rises to the top, is green, turbid, and fetid, and is drawn off by means of a cock placed two or three inches below it. A new brine is then added, which also soon becomes foul, and is drawn off in the same manner.

After these operations have been continued twelve or fifteen days, more or less, according to the temperature of the place, the liquor will remain clear and sweet; but care must be taken that there be always an inch of brine at the top, and that no space be left between the cover of the cauldron and the cabbage, which will otherwise acquire a putrid offensive smell. Sour-croute, well made, and well kept, has a very pleasant acid taste, especially if it be washed after it is taken from the cauldron; and mixed, before it is served up, with a little vinegar. It has been found highly serviceable in long voyages, as a preservative from the sea-scurvy. For the IVth, Vth, and VIth divisions, see the next article.

**Brassica.** In Gardening comprehends cabbage, broccoli, turnip cabbage, cauliflower, Broccolicolus, or rape, and turnip; and of course affords some of the best succulent vegetables of the kitchen garden.

The species chiefly cultivated are such as follow; viz. the B. oleracea, or common cabbage, which has a biennial root, and upright, fleshy stalk, of oblong roundish leaves, which in some varieties closely cabbage into large compact heads; but in others they spread loose and open.

The varieties of this are the common heading cabbage, with a roundish, oblong, closely-cabbage head, of roundish, or oblong, plane, entire leaves; the Savoy cabbage, with a roundish and oblong closely-cabbage head, of roundish, crumplly-curled leaves; the frimbirated open cabbage, or broccoli, having a tall stem, crowned by an open loose head, of oblong cut, frimbirated-cabbage leaves, spreading open but never cabbage: the Siberian broccoli, Scotch cole or kale, with a frowm stem, crowned by a large open head, of oblong, roundish, broad, thick, cut, curly leaves, not cabbage; the green, common, open colewort, having a short stem, crowned with an open head of oblong plane leaves, not cabbage; the turnip-cabbage, with the falk and root swelling, turnip-shaped, being crowned by a head of open oblong-leaves, never close to cabbage; the cluttered brassica, or cauliflower, with an upright frowm stalk, crowned by an open head of oblong, narrow, plain, entire leaves, not cabbage, but having a large cluttered flower-head in the centre; and the Italian cabbage called broccoli, having an erect robust stalk, crowned by a large open head of oblong, dark, and light-green plane leaves, not cabbage, but affording a cluttered flower-head in the centre, in the manner of a cauliflower.

B. Napus, navew, rape, or cole, has a frowm-shaped biennial root, and oblong, frowm-shaped, deeply divided, frimbirated, smooth leaves, not cabbage; the stem leaves being oblong and cordate. This is seldom cultivated in the garden, but is valuable as a field crop; the culture, application, and use of which will be described hereafter. See Cole. B. Rapa or turnip, produces a large round frowm annual root, crowned with oblong, cut frimbirated, rough leaves.

As these plants are mostly considered among gardeners as different, and as requiring different modes of culture, they may be treated of under separate heads.

Of the B. capitata or common heading cabbage the varieties are numerous, and all denominated cabbages, from the circumference of their inner leaves turning in close, and another, till by degrees they form a large, compact, globular, or oval head, some of them attaining a very large size. And as some of them are in perfection in summer, and others late in autumn, they are sub-divided into fummer and autumn cabbages.

Of the early summer kind the varieties are the small, roundish, early cabbage, and the larger, oblong, early cabbage. The fift comes early in May, and the second about the middle, or latter end; both of them soon become very hard, and crack; and, therefore, no considerable quantity should be raised, where the use of the family is only regarded.

Of the sugar-loaf kind the varieties are the early dwarf fugar, the large, and hollow sugar loaf. The fift is a small, longish, pyramidal cabbage, which comes in early in June, and is very sweet white young; but soon grows hard. The second is a large, pyramidal, hollow cabbage, that comes in about the end of June, and is in full perfection in July and August, seldom growing hard or cracking. It is a fine family and market cabbage.

The earl, Yorkshire cabbage is a roundish, oblong, heading cabbage of a moderate size, growing close, hearting quickly, and cabbageing early in summer, as in May, June, or July, &c. It is an exceeding good, tender-baking, sweet-eating cabbage, proper to cultivate with the large sugar-loaf kind, &c., as a principal, early, and general summer crop, and for autumn and winter use as young light cabbages.

The early Battersea cabbage is a roundish-oval-heading, rather smallish cabbage, that heads quick, comes in early, and is excellent for use while moderately young, or of middling light growth, before it becomes very hard.

The early Russian cabbage is a small roundish cabbage that comes in about June and July, heads very full, and soon grows hard: but if used while young and hollow is very sweet and tender.

Of the autumn and winter kinds the principal sorts are the common round white cabbage, which is a large middle-sized, roundish, very white cabbage, that is in perfection about August and September, and which gradually acquires a degree of hardiness. It is hardy enough to endure the winter.

The long-led cabbage is a large, oval, and roundish hollow cabbage, which never grows hard, is exceedingly sweet and tender, and in high perfection in August, or September and October.
The drum-head, or great flat-topped cabbage, is a very large spreading cabbage, generally very broad, and flat at top, and pretty close and firm. It is in perfection in September, and will continue till Christmas, or longer.

The hollow cabbage is a large, roundish-oval, hollow cabbage, which seldom grows hard, is sweet, tailed, and comes into perfection from August to October.

The mule cabbage is a middle sized, roundish, hollow, very tender, crisp-eating cabbage, of a mildy scent. It is in perfection from August or September till Christmas.

The giant, or great Scotch cabbage, is an admirable, large, roundish cabbage, heading very close and hard, arrives to perfection in September and October, and will continue all winter. It is principally valued as a field cabbage for feeding cattle; but eligible also occasionally for family use.

The American cabbage is a very large roundish cabbage, principally for field culture.

The Devonshire cabbage is an exceedingly large very good cabbage, eligible both for the purposes of the two last sorts, and as a profitable domestic cabbage, about the end of autumn and in winter.

The red cabbage is a middle-sized, roundish, thick-leaved cabbage, heading very hard, the whole of a red colour; the darker the red, and the more thick and fleshy the leaves, without any white in the ribs and veins, the more valuable. It is in perfection from August to the end of winter, as well as all the spring months till May; esteemed principally as a choice pickles, and to eat raw as a salad.

All these sorts or varieties of cabbage are biennial, being raised from seed, and attaining perfection the first year; and the second shooting up into flalls, to flower, and seed, soon after wholly perishing.

Both the summer and winter kinds are raised from seed sown annually in beds of common earth, from which they must be afterwards transplanted. The chief periods of sowing are autumn and spring; those plants raised in the autumn arrive at perfection early the following summer; and the spring-raised plants cabbage the same year in summer and autumn, and attain full perfection. But the larger autumn sorts, sown in the spring, do not in general cabbage so soon in autumn, or to so large a size as the autumn-raised crop, planted out chiefly in the latter-end of that season or the beginning of winter, or partly early in the following spring, but will be cabbaged in good perfection in August and September. It is of course always proper to sow some in both the autumn and spring seasons.

Method of culture in the summer kinds.

In the culture of these plants, for the early and first general summer crops, the proper sorts are the dwarf and other small earlier kinds, which it is necessary to observe should only be sown in small portions; larger supplies of the Battersea, or, which is probably better, the large furgar-loaf, and Yorkshire, being put in, the former to come in early as in April and May, and the others to succeed them in June and July. Some of the early Russia cabbage may also be provided.

Thus the autumn sowing serves for the early and first main spring and summer crops of the following year, and the spring sowing for succession crops in summer and autumn. Where the autumn sowing has been omitted, care should be taken to put some seed in as early in the spring as the weather will permit, as the beginning or any time in February, or early in March, in a warm situation for the purpose of early cabbages.

In order to raise an early and general summer crop of any or all of these sorts, a suitable quantity of good fresh feed should be sown precisely about the first or second week in August; as if sown earlier, the plants are apt to run up to feed in spring; and if sown much later, they do not acquire due strength before winter.

For this purpose a spot of rich ground in an open exposure is to be carefully prepared, by digging it nearly one foot deep, and divving it into four feet wide beds; sowing the seeds immediately, each part separately, and raking it in evenly. If the season proves rainy, the plants will rise in ten or twelve days; but if dry weather prevail, it is necessary to water the beds frequently, both before and after the plants appear, and to keep them clean from weeds. When the plants have leaves of an inch or two in breadth, it is proper to prick out a quantity of the larger plants from the seed-bed into nursery-beds, in order that they may acquire due strength, previous to their being planted out for good in October, and the following spring. In this intention, dig over an open spot of the best ground, and divide it into beds as before, raking the surface smooth; then prick out the plants in rows six inches distant, and three or four inches apart in the rows, giving them a full watering, which, if dry weather succeeds, must be repeated occasionally.

The plants may remain in this situation, some till October or November, and the principal part till February, March, or April in the following year, at each of which periods a quantity of the floutest shall be transplanted into the places where they are to remain to cabbage; good ground in an open exposure being allowed them, which, if well dunged, and dug in about a foot deep, will be the better. The plants are mostly put in by line and dibble, in rows; the small early kinds at two feet distant, and about one and a half in the rows; but the large furgar-loaf and Yorkshire kinds should be set two feet and a half distant every way. A double quantity of these sorts should be planted, for the supply of a family; as the small early kinds seldom continue long before they grow hard.

But in planting crops of early or summer cabbages, either in autumn or spring, some may occasionally be planted clover than these distances advised for the principal flouting crops, in order to admit of thinning out for use, by degrees, in young small growth, and a portion also planted in rows at only eighteen inches, as under, by a foot in the row.

It is necessary to observe that, as the autumn plantings sometimes suffer by the severity of frost or other causes in winter, the deficiencies should be made good occasionally from the plants in the nursery beds.

Those that have remained in these beds all winter should be planted out in February, if the weather be temperate and open, where they are to remain, though, if much cut by the winter frost, it is better to let them remain until March or April to become strong. When the winter happens to be so severe as to cut off most of the autumn-raised plants, recourse must be had to an early spring-fowing in February or March; the sooner the better.

Where constant succeions of perfectly young cabbages are required through the summer and autumn season, it is necessary to perform spring and summer sowings to succeed those of the autumn-raising. Some seed of the large furgar-loaf and Yorkshire cabbage should be sown in February, March, or the beginning of April, and smaller portions in May, managing them as already directed, which will furnish supplies of young cabbages in July, August, and September, &c. A small crop may also be sown in June, or early in July, to plant out for successeions of small young cabbages, or good cabbage colewort, in the latter end of autumn and early part of winter.

All the culture cabbage crops require, after being planted H

H
out where they are to grow, is hoeing the ground over occasionally between them in dry weather, to destroy weeds, and loosen the surface of the earth, in order to encourage the growth of the plants; and when they have advanced a little, drawing some earth once or twice about the bottoms of their stems, to strengthen the plants and forward them; as in forward springs the careless forts will often make efforts for heading the latter end of April or early in May; if anxious to have them as forward as possible, four of the belt may be allailed, by tying their leaves moderately close together, with an after twine, or piece of bafe, which promotes their vegetation, whiteens them internally, makes them more crisp and tender, and causes them to be ready for use a week or ten days earlier. In cutting summer cabbages it is proper to press some flakes to remain to produce crops of sprouts, which they yield abundantly. These may either be gathered while young and green, or some left to stand for forming little heads, either of which are in many instances preferred to other summer greens; for this purpose sugar-loaf

and Yorkshire cabbage-flakes should be preferred.

Method of culture in the autumn kinds.

In the culture of these forts it is necessary to consider those of the white or green kinds, and the red separately. These forts are adapted principally for autumn and winter use, as they rarely attain any degree of perfection before August; and some of the larger kinds not till September and October, but continue in excellent condition till Christmas, or sometimes till the end of winter, some of the forts arriving at a great bulk. When used while young, or before they grow hard, they are excellent for culinary use. The scallion for fowing all the late kinds is, as has been observed, either autumn or April; but to have a large succession, it is necessary to sow some seed at both seasons, those sown in autumn and the first week in August arriving at perfection early in the following autumn, as August and September; and the spring sowing coming in about the beginning or middle of September, or towards Michaelmas, though they seldom attain any tolerable perfection till the end of October. They are very fine in November and December, but rarely attain so large a growth as the autumn-raised plants.

The same method of putting the feed in, and pricking out the plants, is to be observed, as in the summer kinds. The time for planting out the autumn-raised plants is, for a few

October or November, but for the principal part February, or early in March; and for the spring-raised plants, May and June. All of them must have an open exposure of well dunged ground, and the plants set in rows two feet and a half at least distant; and for the larger kinds, a yard distant each way should be allowed.

All the culture they need is that of hoeing, to extirpate weeds, and drawing earth about their stems, which is an essential piece of culture in the whole cabbage tribe of plants.

The red cabbage is principally valued for pickling, and occasionally for being shred small and eaten as salad, sometimes also for stewing. It attains perfection in autumn and winter.

The culture which it requires is nearly the same as in the former forts. The feed may be sown in autumn and spring; but as it is a late cabbage, the spring-raised plants do not require the full size for sowing in the proper scallion as those tawn and raised in the preceding autumn; though it is generally proper to sow some feed in both these leasons, in order to obtain a larger succession.

It is most advisable to sow the main crop in autumn, or in the beginning of August, as in that case the young plants will be fit to prick out in September or October in nursery-beds. They should stand four or five inches asunder, and be watered if the weather be dry. The plants are to remain till they acquire a proper growth for planting out where they are to grow, some during the same year in November or beginning of December, and the rest in the spring following; or the whole till that season, as February or March. In either case, it is necessary to allot an open situation of good mellow ground, which should be well dug over and manured with dung; a quantity of the strongest plants being then drawn from the nursery-bed, should be planted out in rows not less than two feet and a half distance every way. After being thus planted out where they are to stand, they only require the culture of occasional hoeing in their advancing growth in spring, and beginning of summer, to destroy the rising weeds, and loosen the surface of the ground, and at the same time drawing a little earth about the lower parts of their stems. They will by this means advance in their growth in a spreading open manner at first and towards autumn, gradually form closing heads in the centre, and increase to large cabbaged-heads in full perfection in September and October, &c., continuing firm for six months or more, being hardy enough to resist the severest frosts. Not only a spring fowing is necessary to have a succession to the autumn late main-crop ready, if wanted in winter, and the following spring, but also to continue longer in the latter leasons before they shoot for feed. If the sowing for a main-crop in autumn has been omitted, some feed must be sown in the spring, as in February or early in March, but not later than that month.

The young plants may be pricked out in April or beginning of May four inches asunder, and occasionally watered, continuing a month or five weeks to gain some tolerable strength, and then planting them out two feet and a half asunder, where they are to grow, giving them the necessary culture of hoeing, as in the former-mentioned crops. They cabbage in moderate heads about September and October, and continue increasing in size during November, if the weather be open, and are proper for use in that season, and continue good late in the spring till April and May.

In order to obtain a spring sown crop as forward as possible for finally planting out, some feed may be sown in February, in a moderate hot-bed, and the young plants pricked out in March or beginning of April, in a warm situation, or in a frame, if an unkindly scallion happens, to have occasional protection, with glaffes, &c. in cold nights and sharp cutting weather, to continue them forward in proper growth for letting out in April or beginning of May, and thereby they not only cabbage sooner but in greater perfection and size in autumn.

For the field culture and modes of application of this plant in feeding cattle, see CABBAGE.

Method of culture in cabbage coleworts.

Cabbage coleworts are almost generally substituted in place of common green coleworts, which, though valuable on account of their hardiness in being proof against frost, yet, as table greens, are apt to boil tough and be rank tasted, being greatly inferior to the latter. What were formerly understood by coleworts were fuch cabbage-greens as never closed or cabbaged, but always remained quite open and green to the heart, and were raised for autumn, winter, and spring use as open greens; but at present cabbage plants, while they continue open and green, or just forming little central hearts, are mostly denominated coleworts, and are the most sweet and tender greens that can be cultivated for autumn and winter eating, continuing fine all the season till summer cabbages are ready. For winter and spring supplies, a considerable quantity of these coleworts should always be
be raised in autumn, and occasionally in spring and summer, for summer and autumn coleworts, such as some of more early and clove-growing, quick-hearing cabbage kinds, as these, even in their young state, will generally have small closing hearts; and what are not used in their young colewort growth may be permitted to stand to grow to proper full headed cabbages. For this purpose, any of the smaller or moderate sized sorts of white or green heading cabbages may be cultivated, though it is most advisable, as just observed, to fix upon some of the early or summer kinds, as being of a more clove heading growth, more tender, and sweeter than the larger sorts. The most eligible of these are the fugar-loaf, Yorkshire, and Battersea cabbages, though the fugar-loaf kind generally surpasses all the other sorts for eating.

The proper time for sowing the feed in this view is any time in July, for the autumn and winter crop; but to have them continue, without running for spring drawing, some should also be sown the beginning of August, as in cabbages, as by this means the plants will continue in a colewort state all the spring months till May, when such as remain advance in growth to heading cabbages, either to cut young in small hearts, or to stand and form proper cabbage headed as may be required. But where a succession of coleworts is wanted all summer and autumn, it is proper to sow some of the same sorts also in the spring, in February, March, or beginning of April, and in June and July to plant out at different times, and thus provide coleworts and small headed young cabbages throughout the summer months.

In raising these different crops of coleworts, some feed for each should be sown in an open situation, moderately thick, raking in even, and when the leaves of the plants are two or three inches broad, the plants should be cut out where they are to stand, in rows a foot and a half that distance in the rows; all the culture they afterwards require is, to have the ground occasionally hilled to destroy the weeds, and loosen it about the plants. When the plants are as large as a full grown coif lettuce, they are of proper size to be drawn as coleworts.

In drawing them for use, especially the spring crops, where there is a large quantity, every other row may be taken, permitting the intermediate ones to stand to cabbage, cutting for use also every other plant in the remaining rows, according as they form little hearts, leaving the others to cabbage more perfectly.

**Method of culture in the Savoy kinds.**

The Savoy is a variety of the cabbage, which, with care, always retains its difference from seed; it admits of some varieties, all of which have crumby curled leaves, and head or cabbage to a large size. The principal varieties are the common green Savoy, the large green Dutch Savoy, the yellow Savoy, the round headed Savoy, the oval headed Savoy, and the fugar loaf Savoy, which are all excellent for autumn and winter use.

They are propagated by feeds sown at two or three different times, from the beginning of February till the middle of April; and for the very early autumn crop, a sowing may be made in August. Each sowing should be made in an open situation, and the feed raked well in. When the plants have leaves an inch or two broad, and stand thick in the seed bed, it is proper to prick out a quantity of them on separate beds three or four inches distant, to acquire strength against the time of planting them out finally. Some of the autumn raised plants may be set out in October or the following months, if the weather be open, and wholly in the beginning of spring; and those raised from early spring sowings should be planted out finally as soon as the plants are of proper growths. The general crops of the later spring-raised plants may be planted out occasionally, as ground is cleared, from May till August: those planted out early being set two feet and a half distant every way; and the next crop about two feet; but the later plantings need not be planted at more than a foot and a half distant.

It is sometimes customary to plant out the summer crops of these plants between rows of forward beans peas, kidneybeans, cauliflower, early cabbage, and other plants, that stand distant in rows and are soon to come off the ground, as by the practice some ground is saved; but the plants are generally best when they are planted out in an open clear spot of ground, previously well dug over for their reception.

In performing the summer plantings it is of much advantage to choose mild weather for the work. Otherwise watering must be practiced several times till the plants have formed fresh roots.

All the culture that is afterwards required is, to hoe them well, to destroy the weeds, and to draw a little earth up to their roots occasionally.

**Method of culture in the borecole kind.**

In the borecole varieties of cabbage, the plants are open, never closing to form a head or cabbage. They possess a peculiar degree of hardiness, for it is almost to bid defiance to the severest winter. The sorts mostly cultivated are the green curled borecole, the red curled borecole, the thick-leaved curled borecole, and the finely fringed borecole. They most rife with a thick flake a yard or more in height, frummented by a large head of thick leaves; in some spreading horizontally every way, being finely fringed and curled, but there are others that grow more contracted. In all the sorts the stems produce numerous fine sprouts early in spring, closely surrounding them for some length, and which, as well as the principal or main top heads, boil exceedingly green and tender. The main heads come in for use in autumn and winter, and the sprouts early in the spring.

They are raised by sowing feed annually from March to the middle of April, for the main crops; and a smaller portion, in the beginning of May, for a succession. They should all be sown in open situations, not too thick, and the feed raked in. A quantity of the plants, when the leaves are an inch or two broad, should be pricked out on beds four or five inches asunder, to remain five or six weeks, so as to obtain a proper degree of strength for the late crops to be selected out finally in June and July for the main crops, in rows two or three feet and a half asunder; and for the late crops, early in August, planting these in rows two feet apart and eighteen inches in the rows. Moist weather should, if possible, be chosen for this purpose.

A small crop may also be sown in autumn, or the beginning of August, to stand the winter in young growth, and be planted out early in the spring, in order to be of the largest full size in the following autumn.

For the field culture of these plants, and their application as the food of cattle, sheep, &c. see borecole.

The Siberian borecole, or Scotch cole, is a sort, some of which grow with very tall stems and large open heads; others more robust, with shorter stems and larger heads of broad early leaves; in some sorts, spreading; in others, standing erect. These sorts are not so generally esteemed as the common borecoles to cultivate in the garden in any considerable crops; they, however, boil tolerably tender and good in the winter, and the heads furnish young sprouts after the main tops are gathered, so that they might be cultivated for winter and spring use. They also answer well in the field. See borecole.

There are some perennial varieties of the borecole kind, with
with variegated leaves, which are cultivated as plants of ornament and curiosity. There are others also of a somewhat perennial shrub by nature, rising with tall branching stems, furnished with leaves all the year round; of some of which are curiously variegated, the plants surviving several years. Those with variegated leaves make an highly ornamental and curious appearance.

These sorts are propagated and continued principally by planting the offsets, slips, and slips of the side shoots, in the spring or summer seasons, watering them till they become well-rooted.

The common or green colewort is a hardy biennial plant of the open-headed kind, with a short stem producing a head of large, oblong, plane, entire leaves, generally of a green colour. It is a very hardy plant, and was formerly cultivated for winter greens, but, till recently picked by frosts, is tough, rank-tailed, never boiling so fine and tender as the cabbage coleworts, for which reason it is rarely cultivated now for the table. They may be raised for winter use by sowing the seed in July, as directed for cabbage coleworts.

The Anjou cabbage or colewort is a plant of the borecole kind, which grows tall, and produces very large open heads. It is raised as the preceding kinds, but must be planted out at a much greater distance.

Brussels sprouts, or clou de Milan, is a dwarf, perennial, open colewort, very productive of sprouts all the year round. It is raised by seeds, as in the other open coleworts, and by the perennial roots, the smallest bit of which will grow and increase very fast.

Method of culture in the turnip cabbage kinds.

This is a singular variety of cabbage, having its stalks swelled globularly, like a great turnip, and crowned by a large tuft of leaves, which never close or cabbage. The sorts are the turnip cabbage, with the turnip above the ground; and the turnip cabbage, with the turnip beneath the ground. The plants rise and grow for some time, as in the common open colewort kind, till they form bulbs. It is the globular or turnip-part of the plant that is used, being sometimes sliced in soups, and by some used as common turnips; but unless employed when quite young, they are rank and unpalatable. They are much recommended for culture in fields, as a green food for cattle and sheep; their chief merit is their hardiness, as they are capable of withstanding the hardest winter. See TURNIP CABBAGE. These plants are propagated by seed sown annually in March, April, and June, being set out in an open situation, in rows two feet asunder, keeping them clean from weeds, and throwing a little earth about the bottom of the stems occasionally. The turnip part will be fully grown by Michaelmas, and continue all winter for use. They may likewise be sown where the plants are intended to remain, and be hoed out to proper distances. This last is probably the best method of cultivating field crops.

Method of culture in the cauliflower kind.

The cauliflower is supposed to be a variety of some of the sorts of common cabbage, brought up to its present improved state by diligent culture. Mr. Miller infers that the cauliflower is specifically distinct from the common cabbage; because, in a course of fifty years' experience, he could never find the least appearance of one approaching the other; because they are so different in their leaves, when the plants are young, as to be easily distinguished; and because the common cabbage puts out one upright item from the centre, which afterwards divides into several branches; whereas the cauliflower sends out many flower items from the part that is eaten, which is a compact collection of the heads of the flowers, dividing afterwards into so many items, and branching out into many spreading shoots, so as to form a large spreading head when in flower, but never rising pyramidically like the cabbage. But, however, affords, that though in a well cultivated soil it may be kept from degenerating, by being properly watered, it will become a common cabbage, if neglected. It was first brought to England from the island of Cyprus, and, in the course of the last century, has been so much improved in our kitchen gardens, that most parts of Europe are now supplied with English seeds.

The varieties are the early cauliflower and the late cauliflower, which are alike in their growth and size, only the early kind comes in about a week before the other, provided the true sort can be obtained, of which, however, there is no certainty, unless by sowing the seed from the earliest sorts, as is the practice of the London kitchen gardeners, who are always in possession of an early and a late kind of the former, of which they are very careful. Both the varieties are of a delicate nature, being generally too tender to reft the cold of the winter season, without the occasional aid of glasses or other means. Those who are curious in the culture of the cauliflower, have generally three or four crops in the year; as an early summer crop, a main summer crop, a late summer crop, and an autumn or Michaelmas crop.

The proper season for sowing the above crops are, for the early summer-crop, about the middle of August; the plants which rise in the same season are to be pricked out, and preserved through the winter, under bell glasses, hand glasses, frames, or other conveniences, which, being planted out in spring, arrive at perfection the ensuing summer, from May to July and August. For the late summer crop to succeed the above, the feed must be sown in February, or early in March, but not later than the first week in April, the plants being set out in May to come in for use in August and September. And for the Michaelmas or autumn crop, the sowing should be performed about the middle of May, the plants being set out in July. These are ready after Michaelmas, and the following month, come to perfection gradually in October, but are never so large, fair, or perfectly headed as the summer crops.

In the culture of the early and main summer crops, great attention is necessary to procure good feed, such as is not more than a year old, and which has been saved from the bell sorts. For the purpose of raising them in the greatest perfection, a bed of the richest light earth, in the full ground, in a free exposure, is to be prepared at the proper period, by digging it well over neatly, one spade deep, and breaking the surface fine, then, either sowing the feed on the surface, and raking it in evenly and lightly; or first, raking the surface smooth, and then sowing the feed, lifting light earth over it to a quarter of an inch in thickness. When the weather is dry, gentle waterings, in the evening, are necessary, both before and after the plants appear; and, if very hot, dry weather, it is advisable to shade the bed moderately with mats in the heat of the day. The plants generally appear in a week or ten days. All the culture necessary afterwards, is occasional watering and weeding, until towards the latter end of September, when their leaves will be an inch or two broad; a quantity of the bell plants should then be pricked out, in four feet wide beds of rich earth, in rows three or four inches distant, rejecting all crooked and black-flanked plants. As soon as they are planted, a moderate watering should be given, which, when dry weather prevails, should be moderately repeated. The plants must remain there till about the end of October, when they should be transplanted into their winter quarters, some being planted out under hand or bell glasses for the earliest crops; others
others into garden frames, to be occasionally protected by glasses till planted out in the spring.

The plants intended to be wintered in frames may also, occasionally, be pricked out from the seed bed at once into the frames to remain. For the plants to be cultivated under glasses, a proper bed of the richest mellow ground should be provided in the heat defended and warmed part of the garden, in a free exposure to the full sun, being well dunged with the beef rotten dung, such as that of old cucumber melon beds, or any other of similar quality, spreading it equally over the ground at least three or four inches thick, and the whole then regularly trenched in one good spade deep, burrying the dung equally, then forming the ground into beds a yard wide, with foot-wide aisles for the convenience of going in to raise, and set off and on the glasses, &c. The plants are then to be put in, allowing three to each glass, though the London gardeners often plant more; but two of the bed are enough to be left to come to perfection. At the time of planting them, a quantity of the hand-drawn, short, clear-shanked plants should be chosen, which being reeled, the line should be trenched along the middle of the beds, and at every yard distance, and three plants put in a triangle, six or seven inches apart; a little water being given afterwards, and the glasses put on, which should be kept close about ten or twelve days. When the plants have taken fresh root, prop them up on the sunny side, about three inches high, with forked sticks, pieces of brick-heap, or wooden prop fifteen inches long, three or four notches being made an inch or two above another to receive the edge of the glass, fixing them in the ground. The glasses, by this means, may be readily propped higher or lower, or on any side as occasion may require. During winter the glasses should be kept almost constantly over the plants, only keeping then lifted on the props in mild weather, on the warmest side, for the admission of air; but in fine, mild, dry days they may be set quite off, which if the plants be forward in growth, should be practised at all opportunities, lest by too constant glazing they be drawn up to flower in their small winter growth, and be rendered useless. The glasses must always be put over the plants at night; and when cutting winds or frosty weather prevail, they should be kept as close down as possible, and long litter laid down close about the lower part of each glass, raising it higher as occasion may require.

In their spring culture, they must be thinned out, about the beginning or middle of March, to one stout plant or two at most under each glass, though in large bell-glasses the market gardeners frequently leave more, for the sake of having the advantage of the glasses, to bring as many as possible to early perfection. The others should be planted out into another place, as a piece of rich, well-dunged ground, the plants being raised with the root of a towel, to preserve the fibres of the roots, being planted too deep and half dilated each way, water being given to settle the earth about them.

The plants under glasses should have the earth directly made good about them, and a little mould drawn up about their stems, continuing to cover them on the sides with the glasses, which must now be raised considerably on props, in proportion to the advanced growth of the plants, not omitting to let them have the benefit of the full air in mild days, and that of warm showers, by occasionally setting the glasses wholly off. But the glasses are to be continued occasionally over the plants until the middle or latter end of April, or longer, if it be necessary. When the plants are so far advanced that their leaves press against the glasses, they should be raised, by forming a border or ridge of earth round each

hole of plants, three or four inches high, on which ridge of mould the glasses should be set, continuing to prop up one edge occasionally as before, and according as the plants advanced in growth, raising them on every side three or four inches in height; as the length of the days and warmth of the weather now increaseth, the plants grow freely, and require as much free air and scope to grow in as it is possible to allow them; at the same time being careful to continue to expose them occasionally to the full air in fine days and moderate warm showers, always carefully defending them in the nights, and in cold rains or boisterous weather, until the weather becomes mild, and the plants are grown too large for the glasses; then they should, by degrees, be fully raised night and day, so that by the middle or latter end of April they may be wholly dismounted. At this period, if the weather be not hot and dry, moderate waterings will be of utility in promoting the growth of the plants, as well as increasing their size and strength. Towards the latter end of May some of the forwardest plants may probably flower, at which period they should be examined daily; and whenever a flower appears to be advanced in growth, it should be put down some of the inward leaves over the head, to screen it from the sun's rays, rain, and full air, in order to prevent it more white and close, as when fully exposed to the weather it generally changes the fine white colour to a yellowish hue, and occasions the head to open before it acquires perfection. The excellence of the cauliflower consists not only in size but in the whiteness, and compact curdy-like growth of the head; such as have a frothy, loose appearance being inferior in value. It is in its utmost perfection of growth when the outward parts of the head begin to open and expand, after which the whole flowers divide and shoots up to flower and seed.

In gathering or cutting cauliflowers, the flower head should, at first, be cut off with a few inches of the stalk, together with most of the surrounding leaves, which should be trimmed down nearly equal to the circumference of the head, especially when for present use; but if required to keep a few days, and such as are intended for market, should have the full leaves to continue, and be trimmed off as wanted. As the stalks of these plants never produce sprouts as in those of the cabbage kind, they should be moved as soon as the head is cut.

In the culture of the plants for the main summer crop, which have been preferred in frames or other places during the winter, in order to be planted out in the spring, it is necessary to observe that the plants should, during the winter, be every day in mild, open, dry weather, exposed fully to the free air by flowing the glasses entirely off, but they should always be drawn on again towards the evenings, and in excessive rains; though in a fine day, and the weather being mild, one end of the glasses may be raised on props three inches high, for the admission of plenty of fresh air, as the plants must not be kept too close in mild weather, as they would run up weakly and tender, or be forwarded too much in growth, and forced into small button-flowers. They only need protection from fruit and immediate rains while in the frames, their decayed leaves being pricked off, and searched for flags, which often attack the plants in frames and hand glasses. When the weather is very frothy, the glasses should always be kept close, to protect the plants; and, if very severe, the additional protection of covering them at night with dry, long litter or garden-mats, should be attended to, being laid round the outside of the frames.

In open, mild weather, as the spring approaches, the plants should be inured by degrees to the full air, by taking the glasses off entirely every day, and gradually leaving them
fully exposed at right in the more advanced part of the spring, to harden them for their removal into the places where they are to remain. From the latter end of February to the beginning of April, according to the weather and condition of the plants, all those which have been wintered either in frames or other ways should be planted out where they are to remain. An open spot of the bed ground should be chosen for this purpose, which should be previously dunged, and dug over, as directed for the early crop; the plants being put in by a line, two feet and a half distant every way, watering them at planting, and in dry, warm weather, repeating it two or three times, till they have taken fresh roots.

In planting this crop, it is sometimes the practice of market gardeners, who have occasion to make every advantage of their ground, to bow a thin crop of Radish and spinach between the rows of cauliflower plants; but the practice is not much to be recommended. In May and June, when the plants have attained considerable growth, the ground should be well hoed, to cut down all weeds, drawing earth about the stems of the plants; and when the latter month proves very hot and dry, occasional waterings may be of great utility, before being formed round the plants for that purpose.

In July this crop will be in full perfection, continuing in succession until the middle of August, when it will be succeeded by the late summer crop.

In order to the culture of the late summer crop, it is necessary to raise a proper supply of plants in spring, to be planted out in April or May, to arrive at perfection in August and September, in time to succeed the autumn raised crops. The feed for this crop may be sown any time in February, but not later than the third week in March; and, in order to forward the plants as much as possible, it is proper to cover them with a flender hot-bed, making from one light box eighteen or twenty inches in depth, of hot dung, covered with light, rich earth, four or five inches in thicknes. The feed should be sown on the surface, and covered a quarter of an inch deep with fine mould; the glass being then put on occasionally, and light sprinklings of water given, raising the glass daily for the evaporation of the steam and admission of free air. The plants will rise in a few days, at which time admit the air freely, by tilting the glass, and by taking it wholly off in fine warm days, and when there are moderate showers. In dry weather, give frequent light waterings. When the plants have leaves an inch broad, prick them out; and if some of them are put upon another moderate hot-bed, it will forward them considerably. From the end of April to the middle of May, some of the forwarded plants may be fit to plant out, which should be in an open spot of rich, well-dunged ground, as in the former crops, and in dry weather they should have frequent waterings, till they have taken good root. The necessary culture afterwards is only occasional hoeing to destroy weeds; and when the plants are somewhat advanced in growth, drawing the earth about their root-toms.

In the culture of the Michaelmas crop, some feed must be sown about the middle of May, on a bed of common earth; and when the plants have leaves an inch or two broad, they should be pricked out three or four inches asunder, to remain until the middle or latter end of July, then planted out as in the other crops, supplying them occasionally with water till rooted. They begin to shed heads towards the end of October, which will continue a great part of December, or sometimes in mild weather till Christmass. But this crop depends greatly on the state of the autumn after Michaelmas, which, if moderately dry and warm, tolerably large, handsome cauliflowers are often produced in November; but if wet and cold, the heads are mossy, small, irregular, and ill-coloured.

The method of culture in the broccoli kind.

This is another supposed variety of the common cabbage, which has different sorts, that, in their growth, habit, and edible parts, much resemble the cauliflower; all of them forming roundish heads in the centre of their leaves, composed entirely of a compact collection of numerous buds or ends of advancing florets.

They are annual-biennial plants, as they attain perfection in the same year, in the early town crops; but in the later sowings, first all the second season, when, after producing heads, they shoot up into stalk, ripe, seed, and wholly perish.

They are cultivated principally for autumn, winter, and spring use, thence being the reasons of their production in the bell perfection, being obtained in the different crops, by a spring and summer sowing in March, April, and May; those of the former months generally furnishing heads in autumn and winter, and that of the latter principally after Christmas, and all the spring months, in which they are commonly rather superior to the foregoing in the production of larger and more perfect heads. They are so hardy as to rebind the cold of an ordinary winter, though very severe frost often affects such as are weak, or grow in exposed cold soils, especially the sort called cauliflower broccoli. The chief sorts and varieties are the early-purple, which is a moderate growing darkish green plant, producing smallish purple heads, but earlier by a fortnight or more than the others; and of which there are the purple, the green, and the blue, often arising from seed of the fame plants. This sort is proper for the fall crop, which, if sow in the latter end of March, or more generally in April, and a succussion crop in May, and planted out in June and July, comes in for use from Michaelmas till Christmas; and when their heads are gathered, the stalks produce plenty of fine sprouts.

The late purple is a large robbly-growing darkish green plant, producing a large purplish head like a cluster of buds, being generally much larger, and more perfectly headed than the former sorts, and very delicate eating; of this there are the common purple headed, the dwarf purple, the blue broccoli, the brown broccoli, the green broccoli, and the yellowish broccoli; all of which frequently rise from the same seed, though of the true purple kind is superior both in size and perfection of heading, as well as delicacy of eating; and with care in fowing the seed, the sorts may be continued. This and all its varieties, by sowing in April, May, and beginning of June, and planting out the plants in July and August, may be obtained for use from about Christmas until the beginning or middle of May, but they are always in the greatest perfection, in regard to size, in February, March, and April; and after the main head is cut, the stalks produce abundance of side sprouts, or sprouts, terminated by small heads, which eat as sweet and tender as the principal ones. The white, or cauliflower broccoli, is a curious variety. The plants are of robust growth, and lightish green colour, each forming a close white head in the centre, sometimes as large as a middling cauliflower, and greatly resembling them in every part of growth, and for delicacy of eating, they are equal to the finest summer cauliflower. This sort admits of no varieties, except in degrees of whiteness, though the whitest generally allumes somewhat of a yellowish hue. By fowing the seed in March, April, or May, and planting out the plants in June, July, and August, may be obtained heads for use all winter and spring; but those that appear about March, and beginning or middle of April,
April, are considerably the largest and fairest heads. The black broccoli is a tall growing plant, of a blackish green colour, which for the most part produces smaller and less perfect heads, being somewhat open and feely like, but possesses the property of being so hardy as seldom to be injured by the severest frosts. There are of this black or dark-headed, the brown and the blue, all sometimes from the same seeds. They are proper for cultivation to stand the winter by way of reserve to serve for spring use, sowing the seed early in May, and planting out the plants in June, and beginning of the following month. All the different sorts or varieties are raised from seed sown in the open ground. The principal season for sowing the main crops of all the varieties, is March and April for the autumn and winter productions, and May and the beginning of June for the principal successive crops to come in for the spring supplies. Some may be occasionally sown to early as February, or beginning of March, of the cauliflower broccoli, as also any of the purple kinds, in order to obtain an earlier autumn production of small heads in the latter end of August, or beginning of September, and beginning of October. The feed should be sown in an open exposure, where the plants rise much stronger than on narrow borders under walls. Each fort should be sown separately, moderately thick on the surface, and raked in lightly; the plants appear in ten or twelve days, occasional waterings being given them in dry weather; and when the plants have leaves an inch or two broad, it is proper to prick them out in a nursery bed three or four inches apart, giving them water as soon as planted, and occasionally till they have taken root, in which bed let them remain a month or six weeks, where they may acquire due strength; by this means they are short, and of robust growth, and will be considerably better prepared for transplanting where they are to stand, than those which remain in the feed bed. The time of transplanting them where they are to remain, is June, July and August, and beginning of September, according to the time they were sown, or are designed for use. The plants should have an open situation, and as good ground as the garden affords; which, if it have the addition of dung, will be advantageous, digging it in neatly one good spade deep, and directly putting in the plants, for which work a moist time is beneficial. They are to be planted in rows two feet and a half asunder, and two feet distant in the lines; but for those that are planted late in August and September, two feet at most are sufficient, and eighteen inches distant in the row. As soon as planted, they should be watered; and if dry weather prevail, the watering should be repeated every other day, till the plants have got root. After the plants have taken root, their further culture is to keep them clear from weeds, by hoeing the ground occasionally; and when they have advanced a little in growth, to draw some earth, or hoe about their stems, which, if repeated once or twice, will be of great advantage in promoting their growth. In gathering broccoli for use, attention must be had that the heads have attained their full growth, but they should be cut while they remain green, and before they begin to divide, and assume a feely-like appearance, and with about six inches of the main stalk to each head, as the upper part of the stalks eats exceedingly sweet and tender, but, previously to its being dressed, it must be peeled, or dwelled of the outer rind.

Saving feed in all the sorts. In order to have good and perfect feed of any of the above sorts of plants, some of the best of each kind should be selected, and left to run up to feed. In the cabbage fort, this is effected either after their heads have been cut, or by letting them remain without being cut. In the first way the items which have the

strongest roots may be left to feed where they stand, or be planted up to the necks in good earth in an open sunny exposure in the autumn, or beginning of winter; and in the latter, the same methods may be used. And when the plants have feeded, great attention should be bestowed to support them well with manure till the feed is perfectly ripened, which is generally the case about the end of July, or in the following month.

Where feed of the different varieties is wanted, the plants for this purpose of the different sorts should be cultivated at as great distances as possible from each other, in order to continue them perfect without degenerating.

When the feed begins to ripen, it should be gradually collected by cutting off the ripened items, to prevent the birds from devouring it. These, after they have been exposed a little to the sun, may be threshed to get out the feed, which sufficiently dried, should be put up in bags, and marked.

In the cauliflower kinds, some of the best and most perfect plants of the cauliflower crop should be left to run up to feed in the situations where they stand, being supported as in the cabbage fort, and occasional waterings given when the feed is dry, to prevent the mildew. The feed should be collected and managed in the same manner as above. It is mostly in a late to be gathered about September. Fresh feed should be gathered annually, as it cannot be depended upon when old.

In the broccoli kinds, the best plants of the early spring crops must be selected, and left to stand with their heads perfect, the side shoots being only taken off. The feeding plants of the different varieties should be at considerable distances from each other.

Method of culture in the turnip kind. All the varieties of the turnip are annual-biennial; as if sown early in spring they attain perfection, run up to flower, ripen feed, and totally perish the same year; and when sown in summer and autumn, they also attain perfection the same seasons, and stand without running to stalk till next spring; then wholly run up for feed, and finally terminate their growth in the autumn following.

The sorts chiefly cultivated are the early Dutch turnip, which is an oblongar, moderate-sized, handsome, white turnip, coming early to perfection, very sweet and tender when young, and a very fine garden turnip for the early and summer crops; though when it is old, it is apt to become stringy.

The early white fleshy turnip is a round, moderate-sized, neat, white turnip, that comes in early, and is very good in its young and middle growth. It is very proper for garden use as an early and first general crop. Of this sort there are the large later turnip, and the early red fleshy turnip.

The white round turnip is globular and large, being proper for the garden and the field, to succeed the two former sorts.

The green topped turnip is large, round, and remarkable for having its outer coat green at top, and a great part of the root growing above ground. It is excellent for a general crop in gardens, to draw for the table when middling growth; and also valuable in the field.

The red topped turnip is large, and of a globular form, having its outer skin red at top. From its very large size, it is also adapted to field culture.

The yellow Dutch turnip is moderately large, and frequently oblong, the skin and flesh being of a yellow colour.

The oblong white turnip is large, and strikes considerably into the ground.

The
The tankard turnip is large, oblong, and cylindrically, of quick growth, the root generally standing above ground. It is a good field turnip, but not proper for the garden.

The large Norfolk turnip is large and round, but mostly cultivated in fields.

The hardy Russian turnip is middle sized, dark colored, very hardy, and continues long in spring without running. It is proper for sowing as a moderate garden crop for winter and spring.

The long rooted French turnip is long, small, and sparsely rooted, but of little merit. The purple turnip is round, small, early, and purple coloured, but grown mostly for curiosity. In general use the early Dutch turnip is the best for the early and first general summer crops, as it generally arrives to perfection a fortnight, at least, sooner than most of the other sorts; and, by an early sowing in spring, may be obtained by the beginning of May. Next to this is the early white turnip for an early and first general summer crop, and the common round white turnip to sow for a main summer crop, all of which may be continued in perfection the whole summer and autumn, by performing three or four different sowings from March until July, to as to have crops regularly succeeding one another.

For the autumn and winter crops the white round, the green topped, and the red topped kinds, are the hardiest. From their magnitude they are to be preferred to all others for field culture.

These roots may be obtained for use eight or ten months in the year, as from about the middle of May till the beginning or middle of March; after which time they begin to shunt into stalk for feed.

The method of propagation in all these sorts, is by sowing the feed in situations where the plants are to remain, as they do not admit of being transplanted with success. The common season for sowing is any time from the beginning of March, until the latter end of July; but to have a long and regular succession, it is necessary to make four or five different sowings at proper intervals, from the latter end of February till the middle of August. The most proper soils for the culture of this root are those of the more light and mellow kinds; as on strong land the roots frequently acquire a stringy texture, and rankness of taste. In garden culture, the necessary space of ground to sow at a time, for the supply of a family, is from about two to six, eight or ten rods, according to circumstances; the proper quantity of feed for each sowing may be from one to two or three ounces; but for large field crops, the common allowance is about two pounds to an acre. The ground should be prepared for the feed by digging it well over, one furrow deep, and breaking it as fine as possible on the surface, the feed being sown while the ground is fresh shrewed, especially when there is hot or dry weather. A moist season for sowing is of great importance. In this culture the feed is mostly sown broad cast, scattering it moderately thin, with a regular cast and evenly spreading hand, afterwards raking it evenly in. It is of much advantage, when the weather is hot, to steep the feed a few hours in water before it is sown, as by that means it germinates more quickly, and there is less danger of the plants being destroyed by the fly. See FLY and TURNIP.

In the after-culture of the turnip, all that is requisite is, when the plants have two or three leaves, or are about a month old, to thin them out to fix, eight, ten or twelve inches distance, and clear them from weeds, which is most effectually done by the hoe, and is best performed in dry weather. At the same time the weeds should be removed, and the surface earth well tilled, as this will prove highly beneficial to the growth of the crops. The very earliest crops need not be thinned to more than five or six inches distance, especially if it is intended to begin drawing the roots as soon as they begin to turnip. In three or four weeks after hoeing, the plants will mostly begin to turnip; and in five or six weeks some may be fit to draw for use. In the markets these roots are exposed clean washed, and neatly bunched up, in number from twelve to fifteen or eighteen, according to their size in each bunch, and disposed of to the retailers by the dozen of bunches.

The field culture of these plants, and their different applications in the feeding and supporting different sorts of live stock, will be given hereafter. See TURNIP.

Saving Feed. To obtain good feed, some of the best roots of the autumn and winter crops must be left to run up to stems, which mostly produce ripe feed about July, or the following month. It should be collected and managed in the same manner as in the cabbage sorts. And in order to obtain feed of the different varieties as perfect as possible, the plants of such varieties should be at considerable distances from each other.

**Brassica Monenfis**, Hudfon and Withering. See Symbrium monenfe.

**Brassica Muralis**, Hudfon and Withering. See Symbrium tenuifolium.

**Brassica Spinosa**, C. Bauh. Pin. See Bunias Spinosa.

**Brassicae, in Entomology, a species of Chrysomela**, that inhabits Germany. The prevailing colour is deep black; wing-cases pale, telfaceous with all the margin, and a band in the middle black. Fabricius, &c.

**Brassicae, a species of Staphylus**, of a ferruginous colour; head and body black; wing-cases punctuated; antennae very thick and hairy. Scothol. Found on the cabbage in Europe.

**Brassicae, a species of Phalene (noctua)**, the wings of which are clouded with cinereous; a black hook connected with the first spot. Linn. Fabr. &c.

**Brassicae, the species of Aphis, that injests the common cabbage. Linn. Fabr.**

Obi. It is Pediculus brassicae of Frianch.

**BRASSICARIA, a South American species of Phalena, of the noctua faction; the wings of which are indented, variegated, and marked with a common gold telfaceous spot; posterior wings white.**

**BRASSICARIA, an insect of the genus Musca, the colour of which is black: abdomen cylindrical; second and third segment rufous. Fabr.**

This is Musca cyanobractis of Degeer. A variety of this species is mentioned by Fabricius, which has the abdomen ferrugineous, with a black dorsoal line at the base. Donov. Brit. Inf. &c.

**BRASSIDELIC ART, a term used by Phacelia, to denote a method of curing wounds by the application of the herb brassicaea, or ophryscoenia, on the fresh wound.**

**BRASSILIS, in Entomology, a species of Papilio (Helenion), that inhabits Surinam. The wings are fuscous; anterior ones spotted with yellow; posterior pair radiated beneath
BRATENBRUNN, Széles-Kut, in Geography, a walled and well-inhabited town of Hungary, in the circle below the Danube, and district of Odenburg, under the jurisdiction of the Esterhazy family.

BRATHYS, in Botany (θάρης, or θάρης, the name of a plant in Dioscorides), a genus instituted by Linnaeus the son for a plant found by Mattis in New Granada, and taken up from him by Schreber (937), Jussieu (254), and Mr. Murtyn, but referred by Dr. Smith (Plant, icon. 41.) to the genus _Hypericum_, in which he has been followed by La Marec, Befc, and Wildenow. See _Hypericum_ Brattys.

BRATSKOIV, in Geography, a town of Siberia, in the province of Irkutsk, and the circle of Ilisim, on the river Angara; 140 miles N.E. of Nihune-Udinka.

BRATSKOW, or BAKOW, a town of European Turkey, in Walachia, situated in a fertile and pleasant country, and the residence of a Roman Catholic bishop.

BRATTELEN, a plain of Switzerland, near Basel, where, in the year 1444, 1500 Swiss withstood the whole army of France, consisting of 30,000, till they were all cut to pieces, except 16 who escaped, and 39 who were found alive on the field of battle. See Basel.

BRATTLEBOROUGH, a considerable township, and port town of America, in Windham county, Vermont; having 1568 inhabitants, seated on the west bank of Connecticut river, about 25 miles E. of Bennington, 61 N. of Springfield in Massachusetts, and 311 from Philadelphia. N. lat. 43° 52'.

BRAVA, one of the Cape de Verde islands, on the coast of Africa, the land of which is high and mountainous, producing, however, oranges and lemons in great abundance, and furnishing excellent wine. The inhabitants are somewhat more than 5000, and they cultivate maize, gourds, figs, water-melons, and potatos; they also breed hogs, cows, fables, goats, and hogs. This island yields a considerable quantity of salt-petre, and the mountains are supposed to be rich in metallic ore, especially copper, as there are several vitriolic springs. The coal abounds with salt. The circuit of the island is about 4 leagues; and it is about the same distance W.S.W. from Fuego. We learn from Sir George Staunton's account (Embassy to China, vol. i. p. 136), that this island is a better and safer place for ships to be supplied with water and provisions than the island of St. Jago, as it has three harbours, one called Puerto Parno on the east side, from which vessels must warp, or be towed out by boats; the Puerto Pijendago to the west; and the Puerto Pieren to the north, which is the best for large ships, and into which runs a small river. N. lat. 14° 54'. W. long. 24° 42'.

BRAYA, a sea-port town of Africa, on the coast of Zanguebar, being the capital of a small republic or aristocracy, founded within the kingdom of Magadado, and at its southern limit, by seven Arabian brethren, who fled hither from the tyranny of their king Jachah, one of the petty monarchs of Arabia Felix. Here they found a convenient and delightful situation, founded on each side by a river, whence some have affirmed it to be an island. This district does not extend far from the coast; as it is very subject to the current of the capital, which is situated on a bay, formed by the mouth of the northern branch of the river, about the distance of somewhat less than one degree from the equator. Bray, which is now a small town, was once large and populous, and carried on a considerable trade in gold, silver, silk, cotton, and other cloths, elephants' teeth, guns, and other drugs, particularly ambergris, with which this coast abounds.

The houses were large and well-built, in the Moorish style; and the town was strong and fortified, and accounted one of the most celebrated and frequented ports on the Indian coast. The people were mostly Mahometans, but under the protection of the kings of Portugal, to whom they annually paid a small tribute. This payment, however, they relieved; upon which Tristam de Cunha, admiral of the Portuguese fleet, bound for India, having set on shore at Melinda three ambassadors sent by king Fanmadd to the emperor of Abyssinia, proceeded to Bray, and, about 200 leagues northward of Melinda; and, after some previous negotiations, assaulted the city. After a severe conflict between the besiegers and the garrison, consisting of 1000 men, the latter retreated into the city, and flung the gates against the enemy. The siege was continued, and the city was at length taken and plundered of a large and valuable booty. Many of the besieged were slain and wounded, and many taken prisoners; but most of them were released. The Portugueze, on this occasion, perpetrated many atrocious acts of cruelty, and Cunha, having plundered the city, set it on fire, and it was quickly reduced to ashes. After this Bray became tributary to its destroyers; but it was never able to recover its primitive grandeur and liberties. Bray appears to have been the Effia of Ptolemy, which was only 1 degree from the line. N. lat. 9° 45'. E. long. 44° 37'.

BRAYA, See Pareira Brayu.

BRAVA, in Geography, a town of Portugal, in the twelfth route of Antonio de Teixeira's itinerary; supposed to be Ludlow.

BRAULIO, in Geography. See Brailo.

BRAULS, in Commerce, Indian cloths with blue and white stripes; otherwise called "turbans," because they serve to cover those ornaments of the head, particularly on the coast of Africa.

BRATNO, in Geography, a town of Bohemia, in the circle of Koniggratz, belonging to the abbey of Benedictine of the place.

BRAWA, a fortified town of Germany, in the circle and duchy of Bavaria, seated on the river Inn. It was formerly the residence of the elector palatine of Bavaria; but ceded to the house of Austria by the treaty of Tilslten in 1779; 8 leagues S.W. of Pfaffenhofen. N. lat. 48° 10'. E. long. 12°.

BRAVNECK, or BRASSGEG, a town of Germany, in the Tyrol, and bishopric of Brixen; 10 miles N.E. of Brixen.

BRAUNER-GEYER, in Ornithology, Cramer's name of the Austrian kite, _filis affrinicus_.

BRAUNER MAINGEREYER of Cramer, is the black kite, _filis orta_.

BRAUNFELS, in Geography, a town of Germany, in the circle of the Upper Rhine, belonging to the count of Solms.
SALMS, with a castle fortified in the ancient manner; five miles south of Wetzlar.

BRAUNSBERG, a town of Prussia, in the bisphric of Ermeland, founded on the Paffarge, which, at a little distance, discharges itself into the bay called Fleichha-fat. It was built in the year 1275, and derives its name from Bruno, Bishop of Prague. In 1601, the inhabitants expelled the Polish garrison, and afforded an asylum to the bishop of Ermeland, who had declared for the knights of the Teutonic order. It was formerly one of the Prussian great cities, and sent representatives to the senate or council of state; but it is now under the jurisdiction of the bishop. It is large and populous, and carries on a good trade. Brandenburg is divided into the Old and New Town: 32 miles S.W. of Königsberg. N. lat. 54° 23'. E. long. 21° 57'.

BRAUNSBERG, a town of Germany, in the circle of Wolfsphalia, and county of Wied Runkel; 4 miles N.E. of New Wied.

BRAUNSDEF, a town of Germany, in the circle of Upper Saxony, and circle of Erfurt; 11 miles N.E. of Erfurt. Also, a town of Germany, in the archdeacony of Lüneburg; 6 miles E. of Meide.

BRAUNSWEIG, a town of Germany, in the circle of Lower Saxony, and duchy of Hanover, serving as a fortress to Kiel, and one mile north from it.

BRAY, John, in Biography, a native of Caflk, practised medicine at Salamanca, the latter part of the 16th century, with distinguished reputation; and he also professor in medicine there, and much reared to and esteemed by his pupils. His works are: "De hydropothia natura, causis, atque medenda," Salam. 1571, 8vo.; "De saporum et odorum differentia, et causis," 1583, 8vo.; "De curandi ratione per medicamenta purgativa exhibitione," 1588, 8vo.; "De simplicium medicamentorum decets," 1592, 8vo.

He also published, agreeably to the fashion of the times, commentaries on the works of Galen and Hippocrates.

BRAY, Cadavid, of Aguilas del Campo, in Old Cadice, physician to Philip IV. and to the Inquisition, took his degree of doctor in medicine at Valencia, where he taught medicine and surgery the middle of the 17th century; and was author of "Revolutionum medicorum circa universam totius philosophiae doctrinam," 1649, Lugduni, fol.; "Constitutiones medicorum et tyrocinium practicum," Colonii, 1671, 4to.; "Opus medicinale, tomus tertius," Lugduni, 1674, fol. The author treats in these volumes of the physiology and the pathology of fever; of the effects of bleeding, purging, and of sudorifics; of the use of the Peruvian bark, lately introduced into practice, which he commends; and, among his observations, he gives an account of the disease and death of Philip IV. of Spain. Haller. Bib. Med.

BRAVO RIO, called also Del Norte, or of the northern star, the principal river of Spanish North America, which, as far as its sources can be conjectured, has a course of about 1000 British miles; but its whole circuit probably exceeds that of the Danube. It discharges itself into the gulf of Mexico. N. lat. 25° 40'. E. long. 97° 30'.

BRAVO! It is a word which needs no explanation. It is an Italian exclamation of applause, which all Europe has adopted.

If, in a theatre, the Italians applaud, a musical composition, and dislike the finger, though they hiss the performer, they afterwards cry out bravura pura il maschio; and on the contrary, when they hiss the composer, immediately after they discriminate, if the finger is a favourite, and exclaim bravura Marcovecchio, or bravura le bruti; and if a composer is a plagiarist from the well-known works of a favourite author, the critics cry out bravura Paffaleo! or bravura Gervaseo.

BRAVONIA, in Antiquity, a city held every fifth year in honour of Diana, summoned Brevonwia from Brauron, a village near Athens, where the famous statue of that goddess, brought from Seythia Taurica, was preferred till it was taken away by Xerxes.

The ceremony of the Brauvania was managed by ten men, from their office called "the house of the victor;" the victim offered was a goat, and it was customary for certain men to sing one of Homer's Idals during the service; other minstrels at the solemnity were young virgins, from five to ten years of age, habited in yellow, and consecrated to Diana, under the denomination of Agens, i.e. bears, which they derived from this circumstance. A bear, having become tame and tractable, was admitted to eat and play with the Philene, the inhabitants of a borough in Attica; but a young maid being too familiar with it, the bear tore her to pieces, and was afterwards killed by the brethren of the damsel. Hence a fatal pestilence ensued, for saying which an oracle advised them, in order to appease the anger of Diana, occasioned by the defilement of the bear, to consecrate virgins to her in memory of it. The Athenians obeyed the mandate of the oracle, and enacted a law, that no virgin should be married till she had undergone this ceremony. Potter. Arch. Græc. lib. ii. cap. 26.

BRAVUM, in Ancient Geography, a town of Spain, placed by Ptolemy in the Taragonensia, in the country of the Murbeget.

BRAVURA, Ital., is a musical term, as Aria e Bravura, implies a style of air, with which in modern times Mifs Davies Ingelina, the Gabriel, the Aguijar, Madame Le Brun, Madame Mara, and Mrs. Billington, have made us perfectly acquainted. M. Gignac, in the Encycl. Meth. has described and apologized for execution, with much taste and feeling. "We admire (says he) the warbling of birds, in tones which we cannot appreciate or understand; the nightingale, blackbird, thrush, canary bird, and lark, charm us with their divinities; the measured intervals and varied melodies exquisitely performed by sweet and flexible voices, supported and enriched by harmony, may afford a delight of a superior kind, in human tones, which can invitate themselves into the innumerable recceves of the heart, to which words can never penetrate, however impregnated, or tuned by numbers."

BRAUWEILER, in Geography, a prefecture and abbey of Germany, in the circle of the Lower Rhine, and electorate of Cologne; 7 miles W.N.W. of Cologne.

BRAUWER, or Brouwer, Adrian, in Biography, a Flemish painter of great eminence, was born of obscure parentage at Oudenarde, as some say, or, according to Houbraken, at Haarlem, in 1608, and obtained instruction in his art from Francis Hals for the profit of his labour. In this situation he manifested such superior powers, that Hals employed him in a garret apart from his other scholars, affixing to him hard labour and a scanty diet, and selling his performances for high prices. From this state of close confinement and harsh treatment he eloped, and went to Amsterdam, where his works were known and esteemed. Having become master of 100 ducatons, which he received for a single piece, he became frantic with joy, and spent it at a tavern in ten days. From this time his usual abode was a public house; and he worked only when he was urged to it.
it by necessity. As soon as he had finished any piece, he offered it for sale; and if it did not produce a ripulated price, he burnt it, and began another with greater care. Possessing a vein of low humour, and engaging, both sober and drunk, in many droll adventures, he removed from Amsterdam to Antwerp, where he was arrested as a spy, and committed to prison. This circumstance introduced him to an acquaintance with the duke d’Arenberg, who, having observed his genius, by some flight sketches drawn with black lead while in custody, requested Rubens to furnish him with materials for painting. Brouwer chose for his subject a group of soldiers playing at cards in a corner of the prison; and when the picture was finished, the duke himself was astonished, and Rubens, when he saw it, immediately pronounced that it was the performance of Brouwer, and offered for it the sum of 1,000 guilders. The duke, however, retained it, and gave the painter a much larger sum. Upon this, Rubens procured his release, and received him into his own house; but, uninflected by gratitude to his benefactor, he flew away, and returned to the scene of low debauch, to which he had been formerly accustomed. Being reduced to the necessity of flying from justice, he took refuge in France; and, having wandered through several towns, he was at length contrained by indigence to return to Antwerp, where he was taken ill, and obliged to seek relief in a hospital; and in this asylum of self-procured poverty and distrest he died in his 32d year. Rubens lamented his death, and procured for him an honourable interment in the church of the Carmelites.

Such were the talents of Brouwer, that, in the course of a dissipated life, he attained to distinguished excellence in the style of painting which he adopted. His subjects were taken from low life, and copied after nature; such as droll conversations, feasts, taverns, drunken quartels, boors playing and disputing at cards, or barbiers dressing the wound. His expression, however, is lively and characteristic; the management of his colours so purring; and truth was united with exquisite high finnishing, correctness of drawing, and wonderful transparency, to such a degree, that his paintings are more valuable, and afford higher prices, than many works of the most eminent masters. Some of his best works are found at Duffield. His drawings are dispersed in the various cabinets of Europe. Several of his designs have been engraved; and we have some few etchings by himself of subjects usually represented in his pictures, which are signed with the initials of his name, H. B.; Adrian being spelt with an H. D. Pilkington. Strutt.

BRAUX, in Geography, a town of France, in the department of the Artois; 5 miles N. of Charleville.

BRAWALLA. See BROWALLA.

BRAWALLA, in the Culinary Art, signifies the flesh of a boar, boned, rolled up, or collared, boiled, and lastly pickled, for the winter’s use.

The method of preparing it is as follows:—After the flesh has been sprinkled withsalt, and the blood drained off, it is to be salted a little, and rolled up as hard as possible. In this state, it is to be boiled in a copper or large kettle till it is so tender as to admit of a daw’s being run through it; and then let by thoroughly to cool. When it is cold, it is to be put into a pickle, prepared by adding to every gallon of water a handful or two of salt, and as much bran of wheat; boiling these ingredients together, and then draining the bran as clear as possible from the liquor. When the liquor is quite cold, the barrel is to be put into it.

Brawn is made only of the sturrier, without the legs; the oldest boars are chosen for this use; it being a rule, the older the boar, the more honey the brawn.

There is also brawn of pig, which is made by salting, drawing, and boning the beast whole, except the head; then cutting it in two collars, soaking it in brine, seasoning, rolling, putting it into a cloth, binding it up, boiling it, and when boiled, hooping it up in a frame.

BRAXEY, in Veterinary Science, a disease of sheep, which is distributed into the dry, colitive, and watery braxey. The dry braxey seems to be cold and inflammation in the bowels, owing to the taking in with the food some hoarfrost, or to a change in the blood arising from the removal of the animals from a poor to a rich keep. The colitive braxey is merely the cough, from obliterated intellines. The watery braxey is supposed to be the "red water," as it arises from the usual cauter, and is attended with the familiar symptom of suppuration of urine. In this latter case, instead of using turpentine and other strong duretices, the surest and safest course is to puncture the bladder, without wounding the guts, and thus to draw off the urine, afterwards covering and healing the wound.

BRAY, Sir Reginald, in Biography, an English politician and ingenious architect of the 17th century, was the second son of Sir Richard Bray, one of the privy council to King Henry VI.; and defended from an ancient family, who accompanied William the conqueror into England, and flourished in the counties of Northampton and Warwick. In the first year of Richard III., Reginald obtained a general pardon, probably, on account of the part he had taken from personal and hereditary attachment to Henry VI.; and he was recommended as a person of fober and prudent policy, to those who favoured the advancement of the earl of Richmond, afterwards king Henry VII., to the throne. In the service of this prince, both before and after his accession, he was ready and active; and his zeal was recompened by a variety of honourable appointments. He was made a knight banneret, probably at the battle of Bosworth, a knight of the bath at the king’s coronation, and afterwards a knight of the garter. He was also confable of the castle of Oakham in Rutlandshire, joint chief justice with lord Fitzwalter of all the forels south of Trent, high treasurer, chancellor of the duchy of Lancaster, high steward of the university of Oxford, and a member of the privy council. In the 16th year of the king’s reign, he had a grant for life of the isle of Wight at the annual rent (says Camden) of 500 marks. He received many other marks of the royal bounty and favour; and died August the 5th 1503, poiffelled of a very great estate; and his remains were interred in the chapel at Winfort. Withstanding the wealth he acquired, and the activity with which he officiated as minister during 17 years, under a sovereign, who was infamous in his temper, and extorted large sums of money from his subjets, historians concur in giving him an excellent character. They represent him as the father of his country, a sage and grave person, a fervent lover of justice, and one who would often admonish the king when he did any thing contrary to justice or equity. His piety and charity were also conspicuous in the usual exercitics of the times, in which he lived.

Of his skill in architecture, he gave sufficient evidence, in building the chapel of Henry VII. in Welfmum abbey, which was conducted under his direction, and in completing the church of St. George at Windsor, to which he was a liberal benefactor. As he died without issue, he bequeathed the bulk of his fortune to Edmund, the eldest son of his younger brother John, who was summoned to parliament in 1529, as baron of Eaton Bray; and he also left considerable estates to Edward and Reginald, younger brothers of Edmund. From Edward, the manor of Shire Vachery and
and Cranly in Surry, which was given to Sir Reginald upon the execution and attainder of lord Audley, defaced to the Rev. Geo. Bray, who published it in 1778. Reginald settled at Barrington in Gloucestershire, where the male line of that branch became extinct, about fifty years ago. Dr. Bray.

Bray, Thomas, a learned and pious divine of the 17th century, was born at Marton in Shropshire in 1636, and after finishing his school education at Oswestry, was admitted into Hart hall, in the university of Oxford, where he made considerable proficiency in those studies, which were adopted to the ecclesiastical profession, for which he was intended. Being under a necessity of leaving Oxford, on account of his circumstances, soon after he had commenced bachelor of arts, he entered into holy orders; and by his industry in discharging the duties of his profession, as well as by his exemplary behaviour, he obtained the patronage of lord Digby, who presented him to the living of Over-Whitacre in the county of Warwick, generously augmented for his sake, by the addition of the great tithes, and in 1667, to the rectory of Sheldon, which he retained till within a quarter of a year of his death. In 1683, he took his degree of master of arts in Hart-hall, Oxford. At Sheldon, he composed his “Catechetical lectures,” published in 1686, which were not only well received by the public, but the means of recommending him to Dr. Compton, bishop of London, who fixed upon him as a proper person for modelling the infant church of Maryland in America, and establishing it upon a solid foundation. In 1696, he was appointed commissary for this purpose, with a salary of £500 per annum. Determined on active and useful service, whatever present sacrifices might attend it, he intimated his readiness to accept the office, on condition of being encouraged and aided in providing parochial libraries for the ministers who were to be sent to the churches of this colony. This scheme of parochial libraries he extended to all the colonies and plantations in America and the West Indies, and also to the factories in Africa; and he connected with it another design, which was that of establishing lending-libraries in every deanery throughout England and Wales, out of which the neighbouring clergy might borrow books; and where they might have an opportunity of confuting them, with regard to all matters that pertained to literature in general, and to their own office in particular. The plan became popular, and many libraries were founded, both at home and abroad. With a view of promoting the utility of these libraries, and of directing the missionaries in the prosecution of their theological studies, Mr. Bray published two books, one entitled, “Bibliotheca parochialis, &c.” and the other, “Apologetic charity,” a discourse upon Daniel xii. 3: preached at St. Paul’s at the ordination of some protestant missionaries, intended for the plantations; to which is prefixed, “A general view of the English colonies in America, &c.” About this time, viz. in 1696, Mr. Bray took the degree of doctor in divinity, though his circumstances would hardly allow of the expense attending it; thinking that this title and honour would give authority to his advice, and serve to promote the benevolent purposes which he wished to accomplish. In 1698, he made some unsuccessful exertions in order to procure a public fund for the propagation of the gospel in foreign parts; but failing in his main design, his efforts were directed for the purpose of forming a voluntary society, which was afterwards incorporated by royal charter. See Society. Ever since his appointment to the office of commissary for Maryland, he had received no emolument from it; but he had expended his time and money in promoting those important objects, to which he was zealously devoted; and, therefore, some of his friends endeavoured to diffuse him from prosecuting his design of going abroad, and to accept of two valuable preferments which were offered to him at home, which were those of sub-almoner and the deanship of Aldgate in London. But persisting in his purpose, and finding that his presence was necessary, he set sail for Maryland in 1699, and arrived thither in March of the following year. He immediately applied to the object of his mission, visited the province, and took measures for the re-establishment of the church, which had been for some time in a very unsettled state. Having obtained a bill from the assembly for this purpose, he came over to England to solicit the royal assent; and, notwithstanding the objections that were urged by those who were to be thus compelled to contribute towards the maintenance of a clergy, from whose services they were to derive no benefit, he succeeded in procuring a law, framed according to his wishes. Dr. Bray, after his return in 1701, published his “Circular letters to the clergy of Maryland.” In 1705, he accepted the deanship of Aldgate, which was again offered to him; and, in 1712, he published his “MartYROLOGY, or papal usurpation,” full a work consisting of extracts from the treatises of celebrated authors, arranged and digested into a kind of regular history. He had provided materials for a second volume; but being obliged to lay aside the prosecution of his design, his martyrdomal memoirs, both printed and MS., were bequeathed by his will to Sion college. Such was the zeal of Dr. Bray for the conversion of the negroes in the West Indies, that he took a voyage to Holland to solicit William’s encouragement of the design; and on this occasion, he was introduced at the Hague to an acquaintance with M. d’Allone, whom he interested in the execution of his object, to such a degree, that he left a considerable legacy towards its completion. Dr. Bray, having met with great success in his establishment of parochial libraries, devoted much time to this business; and for the purpose of impressing the minds of those who are destitute of the ministry, with a due sense of the importance of Christian knowledge, he reprinted the excellent treatise of Erasmus, entitled “Ecclesiae.” In 1727, he made a casual visit to Whitchapel priory; and so much was he affected by the contemplation of the wretched state of those who were confined in it, that he exerted himself in procuring contributions for their relief, and that of other prisoners; and he represented their deplorable condition with such effect, as to induce the house of commons to institute inquiries, which were very important and beneficial. To the solicitations and exertions of Dr. Bray, always directed by a pious and benevolent spirit, many charitable institutions in the metropolis and in other places were much indebted, particularly the society for the reformation of manners, that for founding charity schools, and that for the relief of poor profligates. Having entreated the accomplishment of his various charitable and public spirited plans to proper managers, this good man, happy in the review of a life, that had been devoted to important and useful purposes, and animated by a well founded hope, with regard to eternity, closed his course of service, February the 15th, 1730, in the 73d year of his age. Mr. Whiston bears honourable testimony to Dr. Bray, of whom he says, “that he esteemed him, though not as one of the greatest abilities, as by far the most useful clergyman, and the most indefatigable promoter of religion, and of the pious designs and societies which commerce to it, he ever knew; that he always honoured and assisted him, both in the review of his catechetical lectures, and his many other charitable and Christian attempts; and, that he heard him complimenting himself near his
his death, with those numerous good works he had so heartily promoted.” “Dr. Bray’s opinion,” says one of his biographers, “that civilizing the Indians must be the first step, in any successful attempt for their conversion, is a proof of his good sense, and of the just ideas he entertained on the subject.” Biog. Brit.

Bray, Solomon de, a portrait painter, was born at Haarlem in 1597, or, according to Defoe, in 1570, and is reckoned among the good artists of his time. He died in 1664. Pikkington.

Bray, Jacob de, an historical painter, the son of the former, was born at Haarlem, and is said by Defoe to have died some weeks before his father, in 1664; but other writers affirm, that he was alive in 1680. He distinguished himself by his drawings, as well as by his paintings. At Amsterdam, there is a picture by this artist, in which David is represented playing before the ark; that is much commended. The colouring is so well managed, that it appears as fresh as if it had just come from the cabinet. His drawings on vellum and paper, finished in red and black chalk, are very fine and highly valued. Pikkington. Strat.

Bray, in Geography, a sea-port and poit town of the county of Wicklow, Ireland, situated on the confines of the county of Dublin, from which it is separated by a small river of the same name, that abounds with excellent trout. It has two fairs, at which are sold great quantities of fritze and flannel, with sheep and black cattle. Here are an old cattle, a church and chapel both newly built, and a barracks. In the neighbourhood are many fine feats that attract visitors; and it is also frequented for sea-bathing, and for drinking goats’ whey. Distance from Dublin, 10 miles S. by E. N. lat. 53° 15’. W. long. 6° 0’.

Bray-bank, a narrow bank of sand on the east coast of Ireland, opposite to Bray-head, at the distance of from six to seven miles from the coast, and extending about eight miles N. by E. The least water found on it was nine feet.

Bray-head, a cape on the east coast of Ireland, near the town of the same name, which is steep, and the highest land upon that part of the coast. It is 12 miles north of Wicklow-head, and 5 miles south of Dalkey, the fourth point of the entrance into the bay of Dublin. N. lat. 53° 12’. W. long. 6° 4’.

Bray for Seine, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Provins, 3 leagues S. of Provins. The town contains 2050, and the canton 10,582 inhabitants; the territory comprehends 2724 kilometres, and 24 communes.

Bray for Somme, a town of France, in the department of the Somme, and chief place of a canton, in the district of Peronne, 3 leagues W. of Peronne. The place contains 1662, and the canton 9645 inhabitants; the territory includes 1454 kilometres, and 20 communes.

Braye, a town of France, in the department of the Côte-d’Or, 2 leagues from Dijon.

Brazed, in Heraldry, the same as Brassed, is used to express such charges as are folded or interlaced.

Brazed, in Botany, See Cryptogamia Anthelmeia.

Brazed age is used by the poets to express the third age of the world. See Age.

Brazed, among Miners, is the standard by which the other clines are gauged, and is kept in the king’s hall.

Brazed silver, in Jewish History, one of the utensils of the court of the tabernacle, described in the 30th chapter of Exodus, and conveniently situated between the east end of the tabernacle and the altar of burnt-offerings. Neither its shape nor size is mentioned by Moses; but it was probably of considerable capacity, as it served for the use of all the priests to wash their hands and feet, before they performed their ministry. It is said (Exod. xxviii. 8.), that Moses “made the laver of brass, and the foot of it of brass, of the looking-glasses of the women, who adorned at the door of the tabernacle of the congregation.” Such were the ancient mirrors, made of polished brass or other metal: which gave but a dark or obscure image, in comparison of glass mirrors. Hence, it is said, we read (1 Cor. viii. 3.) of “seeing through a glass darkly;” or rather “in, or by a glass,” as a אָאַת signifies. Some have supposed, that an error has crept into the text, or an exchange of one letter for another like it, as of ד instead of ר and that it should be rendered, “he made the laver and its foot of a brass like the looking-glasses of the women that adorned about the door of the tabernacle,” by which we are to understand, that he made them either of the same metal, or that he gave them the same degree of brightness or fineness. And, if what an ancient father tells us be true, with regard to the Egyptian women, that they used to go into the temple with a looking-glass in one hand, and a timber in the other, it will serve to illustrate the practice of the Hebrew women’s wearing such an ornament when they came into the tabernacle. Tremell, in loc. Cyril. Alexander, de Adorat. in Spirit, &c. tom. i. 1. 2. p. 64.

Braze, or molten sea, an utensil in the temple of Solomon, for the fize and construction of which, see 1 Kings, chap. vii. and 2 Chron. chap. iv. The water contained in it served for the washing of the sacrifices, and of the priests and Levites, before they performed the several services assigned them; and for this purpose it was drawn out by pipes and conduits. It was filled with water by the Gibeonites, who were afterward called Nethinims.

Brazent serpent, a figure of the fiery serpent or saraph, which Moses was instructed to form and to elevate upon the top of a pole, promulgating the Hebrews, that all who were bitten by serpents, and should look towards this image, should be healed; as the event proved. Numb. xxiv. 9. Our Saviour compares the bringing up of this serpent on the pole to his elevation, or exaltation, upon the cross. John iii. 14. John xiv. 32. This brazent serpent was preferred among the Israelites till the time of HazëchIáh, who, being informed that the people paid a superstitious worship to it, ordered it to be broken in pieces, and by way of contempt gave it the name of “Nehuflan,” i. e. a brazent bowed or triform. 2 Kings, xviii. 4.

Braizer, an artificer who makes and sells pans, pots, kettles, and other kitchen utensils and braes were.

Intrant braziers, who go about with their tools and knapsacks, are called tinders; by the French, branches of the cobliette, chandelières au filet.

Brazil-wood, in Botany. See Cæsalpinia, and Brasil-wood.

Brazing, the soldering or joining of two pieces of iron by means of thin plates of brass, melted between the two pieces to be joined.

If the work be very fine, as when the two leaves of broken faws are to be joined, it is to be covered with beaten borax, moistened with water, that it may incorporate with the brass duit, which is here added; and the piece is exposed to the fire, without touching the coals, till the braes be observed to run. To braze with a full greater degree of neaty, they use a folder made of brass, with a tenth part of tin; or another, one-third braes, and two-thirds silver; or brass and rosin: observing, in all these ways of brazing, that
that the pieces be joined close throughout; the folder only holding in those places that touch.

The method of brazing, among smiths, farriers, &c. is by beating the two pieces, when hot, over one another; this is more properly called welding.

BRAZZA, so called from the town of Brazza, in Geography, an island in the gulf of Venice, about 10 leagues long, and 3 broad, near the coast of Dalmatia, opposite to Spalatro, and subject to Venice. N. lat. 43° 45', E. long. 16° 16'.

BRE, a river of Denmark, which runs into the North sea; 6 miles S. W. of Tondern.

BREA, a small island in the Pacific ocean, near the west coast of North America. N. lat. 16° 38'. W. long. 59° 1'.

BREACH, a cape on the south-west coast of Ireland, being the south-west point of Valentia island, in the county of Kerry. N. lat. 51° 50'. W. long. 16° 16'.

BREACH, in a general sense, denotes a break or rupture in some part of a fence or inclosure, whether owing to time or violence. The word is formed from the French brecière, which signifies the same; formed of the German brechen, to break.

Inundations, or overflows of lands, are frequently owing to breaches in the dikes, or sea-banks. Dagenham breach is famous; it was made in 1707, by a failure of the Thames wall, in a very high tide. The force wherewith it burst into the neighbouring level, tore up a large channel or passage for water a hundred yards wide, and in some places twenty feet deep, by which a multitude of subterranean trees, which had been buried many ages before, were laid bare. Phil. Trans. N.S. 325. p. 417.

Breach, in the Military Art, is an extensive aperture, gap, or opening made in any part of the works of a town, either by battering the walls with artillery or springing mines, in order to storm the place, or carry it by assult. They say, make good the breach, fortify the breach, make a bulwark on the breach, &c. To clear the breach, is to remove the ruins that it may be the better defended.

The ancients were not provided with means so effectual as our artillery to batter down the walls of fortified places. The catapult and balance, redoubtable as they were in the open field, or the attack of a camp, were not competent to this effect. With the Greeks, the Romans, and other nations of antiquity, it was necessary to advance close under the walls before they could make use of the ram, their principal instrument of assault. All the other operations of a siege; the construction of their aggeres or terraces, the moving turrets, the telluruses, galleries, and vines, were only directed towards this principal object, that of favouring the approach of the ram towards the town. So long as the besieged maintained themselves in possession of their walls, it was not possible to make use of this formidable weapon. Most of their machines, especially such as tended to avert the effect of the ram, were disposed upon the parapet of the front attacked; and mailers of their battlements, they called the besiegers with incessant showers of darts and arrows, large stones, entire beams, burning pitch, melted lead, and every kind of missiled arms. They directed their principal machines against the ram, whose force was useless the instant its equilibrium was disturbed. But as soon as the catapult and balance of the assailant had cleared the walls of the place, and the besiegers, protected by their terraces, had filled the ditch, no obstacle remained to prevent the application of the battering ram. Its effect was inevitable the moment the vibration of the machine was undisturbed and free. The place was then reduced to the last extremity; and if the garrison had rashly held out until the ram had struck the wall. "si amus marmur tetigisset," no capitulation was afterwards granted, unless upon the severest terms.

The ram generally approached the place under the protection of the telluroid, a kind of covered gallery, within which it was either sufferéd in equilibrio, or relied on a safe, and worked by a considerable number of hands. In this situation, no tower or wall of masonry, however thick, could for any length of time resist the tremendous shock which accompanied its blows. The ram, however, was not always the method used by the ancients to effect a breach. They sometimes employed their apparat, subterranean passages, or mines, which, having carried completely under the front of the place attacked, they sustained the walls by enormous beams, until the space undermined was judged sufficient, and then setting fire at the same time to all these beams, their fall infallibly brought along with it great part of the fortification, and opened a wide breach for the assailants to mount over.

Among the ancients, the art of defence, the moment that the besiegers had filled the ditch, planted their machines, and brought the battering ram up to the foot of the wall, bore no proportion to that of attack. Several means, however, were invented to prevent or lessen the effect of this last terrible machine, particularly at the siege of Platea, in the Peloponnesian war. The besieged made use of nooses or pincers, with which they caught the head of the ram, and either drew it up to the walls, or at least disturbed its equilibrium for a considerable time, and spoiled the effect of its stroke. They also made use of a large beam, hung horizontally, by heavy iron chains, to two immense wooden levers, planted upon the battlements. This, when they beheld the ram about to commence its action, they elevated to a great height, and letting it fall suddenly upon the machine, caufed the head of the ram to plunge, and thus considerably deadened, if not entirely destroyed, the impetuosity of its blow. Even when the breach was made, the diligence of the garrison sometimes provided the means of a new defence. During the siege, it was customary to build a new wall, in form of a crescent, behind that against which the enemy directed their principal efforts. This much disheartened the besiegers, who, when they flattered themselves with having overcome all resistance, and holding the town at their mercy, were thus often obliged to recommence the prodigious labour of their aggeres, vines, and other machines against the re-entering wall: a new labour equally difficult and dangerous, as in the process their flanks were laid open to the darts, stones, and other missiles of the enemy. The celebrated sieges of antiquity afford many instances of this method of protracting a defence. The sieges of Platea, by Archidamus; of Halicarnassus, by Alexander the Great; and of Rhodes, by Demetrius Poliorcetes, are the most remarkable in the Grecian history. On the latter occasion, the town was preferred by the construction of a second wall, when the machines of the Macedonians had overthrown the first, and made a very practicable breach. At Athens, when besieged by Sylla, in his war against Mithridates, the same expedient was made use of; but without the same success. But ancient history affords no example of a siege where this mode of defence was carried to so great a length as at Saguntum, when attacked by Hannibal. Several walls were repeatedly raised one after another, to protect those parts of the town in which the Carthaginians had not got footing; and by dint of these succetive inclosures, the inhabitants maintained a bloody resistance for nearly eight months. The fatal consequences of this obstinacy are sufficiently known. Guichard, Memoires

In modern warfare, breaches are sometimes effected by battering the place with cannon, sometimes by sapping mines, and oftentimes by a combination of both. In the former case, batteries for making a breach in the body of the place, and ruining the defences, are generally erected upon the covert way, after the besieged have been driven from all their exterior fortifications. As the ravine is to be attacked first, and is flanked or defended by the faces of the bastions opposite to its ditch, the first batteries erected are to ruin the defence of the ditch, and to make breach in the ravine. Each of these batteries should contain four or five 24 pounders at least. Sometimes the batteries raised against the ravine are also used to batter the faces of the bastions; but as this cannot be done without breaking the wall of the ravine too near the flanking angle, it will be much better to erect batteries for that purpose, although if the faces of the protecting bastions were well enfiladed by the guns of the first parallel, firing a ricochet, there would be no occasion for any others. Whilst these batteries are erecting, fresh ones must be made to ruin the flanks of the bastions, of as many guns as can be placed opposite to them, as also some to play against the opposite faces. The best place for effecting breaches, both in the ravine and bastions, is about 15 fathoms from the flanking angle; so that battering on both sides of the angle the breach will become spacious and large; whereas, on the contrary, were the breach made too near the angle, it would become too small and incommodious.

All these batteries are made on the ridge of the glacis, within three fathoms of the covered way, which interval serves to construct the parapet or epaulement; and as the guns which are to effect a breach should fire as low as the bottom of the ditch, the embrasures must be made sloping downwards accordingly. The guns intended to make breach should always fire together, or in salvo's, and as nearly in the same place as possible, and continue so till the wall is quite pierced, which may be known by the earth's falling. They must begin firing at first as low as they can, and batter the wall nearly in an horizontal line, as far as the breach is intended to be made; afterwards fire something higher, in the same manner as before, and continue so to do till the wall tumbles down; for should they fire at first too high, the rubbish would cover the lower part of the wall, so as not to be broken afterwards, and the breach thus become impracticable. The wall being broken down as far as is necessary, the counterforts must be beat down likewise, which, as they advance farther into the earth than the wall itself, will be sooner demolished by firing at them obliquely.

The other, and the shortest way to make a breach, is to pierce the wall with guns, so as to make a hole for two or three miners to lodge themselves in it, who are sent over the ditch as soon as it is dark (in boats, if the ditch is full of water), and make three or four small mines under the parapet, which, when sprung, will at once open a breach sufficiently large, and wanting nothing but to be cleared in order to give an assault. The breach effected by battering, however, certainly costs less men than that accomplished by mines, because, in case of a dry ditch, the necessary establishments there to sustain the miner are avoided; and, if the ditch is filled with water, the ruins of the breach partly choke it up.

The breach being made, and the effects of the mine clearly distinguishable, however practicable it may appear, it is not prudent to hazard a general assault immediately after the mine has been sprung. It is necessary that it should be well examined by hardy and resolute men, who should, if possible, gain the top of the breach, reconnoitre the pature of the garrison, and discover what precautions they may have taken in different places, to counteract the effects of a storm. All breaches made in the body of a place, or in the more important outworks, should be widened as much as the ground will admit of, so as to oppose to the enemy a greater front than that by which he can advance to drive out the besiegers. A practicable breach ought to be fifteen or twenty fathoms wide. This, once made, and the ground levelled, with all materials and tools at hand, the troops directed to mount the breach disposed ready for the assault, and others drawn up to support them in case of need, the guns and mortars should begin to fire briskly on all the defences of the place which flank the front attacked, both directly, and enfilading them by the ricochet batteries; and a great number of shells and stones should be thrown into the ravine or bastion, and its defences. This having continued for some hours, the signal is given for ceasing to fire; and the troops marching to the assault, charge the garrison vigorously, and oblige them to retire. After this, the workmen, headed by an engineer, advance to make a lodgment on the upper part of the breach, which, when partly done, the troops retire behind it, ready to repulse the besiegers if they should return, which they will not fail to do as long and as often as they can. But when this lodgment is once so far advanced as to be in a condition of receiving a good number of troops, the besieged will have it no longer in their power to disturb them by open force, and therefore they will use of their mines, as the last resource left them, if they have not been prevented beforehand, either to blow up the lodgment, or any other place where they perceive a body of men.

When the inner intrenchments have not been ruined by the bombs or mines, which may be the case when they are furnished with revetments, or have not been sufficiently reconnoitred, other proceedings become necessary. Lodgments should be carried on by saps along the parapet, to get possession of the traverses, if the besieged have made any to shelter themselves from the ricochet batteries. These lodgments must themselves be well traversed, from the enfilades to which they are unavoidably exposed, and joined by others across the work, which serve as a sort of parapets to divine the garrison from their intrenchments. If the besieged are retrenched upon the two flanks of the bastion, or at its gorge, which, it is to be presumed, is the case, when the explosion of the mines does not entirely drive him out of the work, it will be expedient to make capacious lodgments on the breach, extend it by means of fourneaux and small mines, and render its accesses practicable and easy, even for heavy artillery, which it may be necessary to mount in battery on the top of the breach, in case that the bombs fail in driving the garrison out of their retrenchments. If there should be any pallisades placed either round these retrenchments, or serving for retracements themselves, they must be broken down with the guns from some battery that can play upon them; or, if this cannot be done, small mines must be carried underneath to blow them up.

These are necessary precautions against the obstinacy of a governor or garrison, who are determined to defend themselves to the last extremity, and which, on such an occasion, must never be neglected. For an assault given halily and incommodiously after springing a mine, and which a prudent and
and wife governor only withstands when he finds himself enabled to do so without much risk of being forced, always command general form of the hall and barred soldiers in his army, and frequently deter the rest from subsequent hazardous attempts, especially if the direction from the commander, and though has been considerable. When the breach is to be carried sword in hand, it is indispensably necessary that all the defences of the work should be breached; the breach itself very practicable, and that, both before and during the attack, an incessant fire of cannon, musketry, and mortars should be poured upon, and into the works enfolding that the immediate object of the assault. The front of the assault should fasify and embrace the whole extent of the works; for, under these circumstances, the superior depth and number of the besieger's column of attack, must necessarily, as at Oeakow. B. Bender, Valenciennes, &c., overbalance the insufficient resistance which can be opposed by a garrison. It was from a neglect of all these precautions, that the grand attack of the confederates upon the cellare of Namur in 1695 entirely failed. The columns destined to mount the different breaches began their march from too great a distance, and, although protected by a prodigious fire of bombs and artillery, the most forward never penetrated further than the middle of the breach; and they retreated after sustaining a serious loss. In fact, it is almost impossible to mount a breach by assault, while any works remain, whose fire is either directed upon, or enfilades the attack.

But, on the other hand, it is equally rash in a governor to re-attend a form, or hazard the lives of his garrison in fruitless attempts to maintain possession of the breach, after these works have all been destroyed, and the breach is reduced to its own defences. A place thus obstinately holding out is in danger of being taken by assault, and the garrison put to the sword, or obliged to surrender at discretion. Retreats, indeed, may sometimes serve to protract an unavailing resistance; but their conclusion should not be delayed, as generally the case, till after a breach has been made in the body of the place, with the sole view of obtaining a better capitulation. When the siege is once formed, much time is lost in their formation; and the losses of men by the bombs thrown into the haillen is very great, besides the considerable fatigue which the soldiers experience. In the ravines, horn-works, crown-works, lunettes, and other detached fortifications, they are of greater service, especially when the ditches are dry, and the communication with the body of the place easy; for, then it becomes impossible to carry them by the gorgias. And when they have revetments, and a fossé, the besiegers will be reduced to the necessity of bringing up artillery upon the work to batter them in breach, or to try the effect of his bombs. If the enemy adopt the method of a blunted sap, he must be very careful to cover himself from the fire of the curtain, and the faces of the bottlons; and in every one of these cases, much time is lost before he can approach the body of the place.

The breach itself may also be defended to advantage. When the enemy are ready to mount, a great quantity of all kinds of combsibles are thrown at the foot of the breach, to be fired, and consequently supplied with fuel. While they are mounting, a great number of grenades must be thrown among them; sakes, glass, or earthen bottles filled with powder, and burning matches twisted round them, crow-foots, harrows, and large timbers, with long iron spikes fastened with chains, so as not to be removed, as also shells, so confined, as not to roll out of the breach. A great quantity of loose powder may a be scattered about, and fire fit to it at the approach of the enemy. This being well executed, and fire arms, both great and small, well served, together with the mortars for throwing shells and stones, will do them infinite damage, and sensibly retard the taking of the work. When the defence is exhausted, and the enemy at last are masters of the breach, the mines are fired, to destroy, if possible, their lodgment, with all the men established in it. Should this succeed, the besieged may return immediately, and clear the breach, so as to render it impracticable. Several mines should be made under one another, if the ground will allow of it, that the breach may be destroyed several times, which will sometimes dishearten the enemy's troops, put them out of all patience, and may eventually contribute to make them raise the siege, as was the case at Maastricht, when besieged by the prince of Orange in 1674.

Brecc of close, in Law. See Close.

Brecc of covenant, denotes the non-performance of any covenant expressed or implied in a deed; or the doing of an act, which the party covenanted not to do. See Covenant.

Brecc of duty, denotes the non-execution of any office, or office, or trust, &c. in a due and legal manner. See Assumpsit.

Brecc of peace. See Peace.

Brecc of pound. See Pound.

Brecc of prison. See Prison.

Brecc, to batter in, batre en brèche. See Battering.

Brecc, mounting the. See Mounting.

Bread is ordinarily made of the flour or meal of some farinaceous vegetable ground, and kneaded with water and leaven or yeast.

In describing the process of making bread, it is natural, in the first place, to advert to the substance or material of which it principally consists. This is the flour obtained from farinaceous vegetables, principally wheat or rye, or a mixture of both these, called in many parts of the kingdom bread-corn, converted into meal by trituration, or grinding in a mill, and separated from the husk or bran by sifting or holing. This is composed of a small quantity of mucilaginous farinaceous matter, soluble in cold water, and separable from it by evaporation, much flour, which is scarcely soluble in cold water, but capable of combining with that fluid by heat, and an adhesive grey substance, called gluten, insoluble in water, ardent spirit, oil, or other; and in many of its properties resembling an animal substance. When flour is kneaded with water, it forms a tough paste, containing the constituent principles of flour, with very little alteration, and not easily digested by the stomach. By heat the gluten, and probably the flour, undergoes a considerable change, and the compound is rendered more easy of modification, as well as digestion. When this dough is kept in a warm place, it swells up, becomes spongey, and filled with a number of air-bubbles, dengages at length an acridulous and spirituous fluid, taints four, and in this state is called "leaven," from the French word "lever," to rise. Whillest the dough, or paste, is left to undergo a spontaneous decomposition, in an open vessel, the various ingredient parts are differently affected; the farinaceous part is convertible into an ardent spirit, the mucilage tends to coagulate and mouldiness, and the gluten probably verges towards a state of putridity. By this incipient fermentation, the bread becomes more digestible and light; that is, it becomes much more porous by the dengagement of chalybe liquid, which separates its parts from each other, and much enlarges its bulk. The operation of baking puts a stop to this process, by evaporating a great part of the moisture which favours the chemical
Among the ancients, we find various denominations of bread; such as 1. Panis figuratus, called also mundus, artificium, juniper, colophon, and rohes, corresponding to our white bread; being made of the purest flour of the best wheat, and only used by the richer classes of persons. 2. Panis secundus, or secundarius, called also saullarius, or saulignus, the next in purity; being made of fine flour, from which all the bran was not lifted. 3. Autopsia, called also fucorumagus, or confignatus, made of the whole substance of the wheat, without retrenching either the finer flour or coarser bran; corresponding to our household bread. 4. Catena, being to the fame with that otherwise denominated fridulius, as being given to dogs; furfuraceus, furfuraceus, or furfuraceus, because it contained mostly of bran; and, in the middle age, biffin, on account of its brownness; and sometimes also leite.

There were other kinds of bread, denominated either from the ues to which they were applied, or the manner in which they were made; such as, 1. the militaris, which was prepared in camp by the officers and soldiers with their own hands; for which purpose some had hand-mills, and others pounded the corn in a mortar, and baked it on the coals. 2. Citharae, that baked in an oven, by what contradiction from that baked on the hearth, or under the embers. 3. That called fabriicenitus, or faber tricor cultus; sometimes also rarefus, because it was to be turned in the baking. 4. Nautes, answering to our farin-biscuit, and denominated bit cultus. See Bisket.

Other kinds of bread were denominated from certain qualities belonging to them; such as, 1. Panis sectus, that which had been long baked; such was the bit cultus, naval and buccellated bread. 2. Madidus, a soft made of rye or bear, sometimes also of fine flour, with which they fmarred their faces, by way of a cosmetic, to make them smooth. 3. Acidus, or four bread, which was acidulated with vinegar. 4. Azygus, unleavened, or unfermented bread.

The French have also many varieties of bread; as queen's bread, Adam's bread, bread de Sigovie, de Gentilly, quality bread, &c., all prepared in peculiar ways by the bakers at Paris. The bread de Gonesse excels all others, on account of the waters at Gonesse, about 3 leagues from Paris; it is light, and full of eyes, which are marks of its goodness. Pain de meunier is that which each family bakes for itself. Spice-bread, pain d'épice, denotes bread baked and iced over with the feum taken off sugar in refining houses; it is also sometimes made with honey, and other sorts of feaoning, and answers to what the ancients call panis miscitus.

Among us, bread is chiefly divided into eubite, eubates, and husbeld; differing only in degrees of purity. In the first, all the bran is separated; in the second, only the coarse: in the third, none at all; so that fine bread is made only of flour; eubates bread, of flour, with a mixture of the finer bran; and husbeld, of the whole substance of the grain, without taking out either the coarse bran or fine flour. Stat. 8 Ann. cap. 18. We also meet with fynel breed, manchet or roll bread, and French breed; which are only to so many denominations of the finest or white bread, made of the purest flour: except that in roll-bread there is an addition of milk; and, in French breed, of eggs and butter also. To which may be added, ginger-bread, made of white bread, with almonds, liquorice, aniseed, rose-water, and sugar or treacle; and wishful-bread, panis mixtus, made of wheat and yce, or sometimes of wheat and barley.

The proceeds of making husbeld bread among us, is thus: to a peck of meal they add a handful of salt, a pint of yce, and three quarts of water, cold in summer, hot in winter, and temperate between the two; the whole being kneaded

Vol. V.
in a bowl or trough by the fire in winter, from it in summer, will rise in about an hour; they then mould it into loaves, and put it into an oven to bake.

For unleavened bread, part of the flour intended for it being made into dough with warm water and a little salt, is laid in the rest of the flour an hour or more, in which time it rises to three times the bulk; then they mix and knead the whole with more water, till it be brought into a stiff dough; which being formed into loaves, is baked in the oven; though the more usual way is to take a piece of dough kneaded and leave it in the tub till next time, when they break it small and mix it with the meal, adding some yeall. Hought. Collect. tom. i. N° 92. p. 241.

For French bread, they take half a bushel of fine flour, ten eggs, and a pound and a half of fresh butter, into which they put as much yeast, with a manchet; and tempering the whole mass with new milk, pretty hot, let it lie half an hour to rise, which done, they make it into leaves or rolls, and wash it over with an egg beaten with milk; care is taken the oven be not too hot.

In Lancashire, and several other northern counties of England, the people have several sorts of oat-bread: as, 1. The bannock, which is an oat-cake, kneaded only with water, and baked in the embers. 2. Clap-bread, which is made into thin hard cakes. 3. Bitchens-bread, which is made of thin batter, and formed into thin soft oat-cakes. 4. Riddle-cakes, which are thick and four, and very little different from the hand-cake bread, which has but little leaven, and kneaded stiff. And, 5. Jannock, which is oat-bread made up into loaves.

In Scotland they have peafl-bread, consisting either wholly of the flour of peafl, or of this and oatmeal mixed; the dough, sometimes leavened, and sometimes made only with water, is formed either into bannocks or cakes, and baked over the embers; or into what they calllap's, i.e. a kind of flatflth rolls, and baked in the oven.

In the flatlute of affixe of bread and ale, 51 Hen. III. mention is made of waitel-bread, cocket-bread, and bread of treet, which answer to the three sorts of bread now in use, called white, wheaten, and headfield-bread.

In religious houses, they heretofore distinguished bread by the names, equire-bread, panis arvigerum; monks-bread, panis conventualis; boys-bread, panis puerorum; and servants-bread, panis famulorum, or panis serventialis. A like distribution obtained in the households of nobles and princes; where, however, we find some other denominations, as meflengers-bread, panis nuncius, that given to messengers, as a reward of their labour; court-bread, panis curiatis, that allowed by the lord for the maintenance of his household; elefatory-bread, that distributed to the poor in the way of alms. Du-Cange Gloff. Lat. tom. iv.

Bread is usually made of the feeds, sometimes also of the roots, and even the pith of plants. The first bread is supposed to have been made of the plant "lotus." In some countries they make bread of acorns. See Acorns. In the islands of Banda and Ambonya, they make a kind of bread called "fagem," or "fage," of the pith of a tarinaceous tree, which yields a white mealy subflatus, that, being kneaded with water, fermented, and baked on the coals, serves the poor for bread. See Sago. In the Caribbean islands, &c, they make bread of the root of a poisonous plant called "Manioc;" probably the same with the Canafada bread, which is made of the root of the Yucea Mexicana. See Manioc, and Cassada. To the denomination of bread, made of roots, may also be added potato-bread, frequent in Ireland, and turnip-bread, used occasionally in some parts of England. Potatoes, previously peeled, cut into thin slices, and put between folds of paper, will dry in a heat somewhat less than 35° of Reaumur's thermometer, and, when thus dried, will preserve their white colour. In this process they lose about two-thirds of their weight, and they may be then reduced to a fine powder, which indicates the presence of an amylaceous matter, and has the smell and taste of wheat. It is also nutritious, and may be kept for a long time. From these circumstances, M. Parmentier was led to attempt the making of bread with the meal of wheat, and that of potatoes, mixed in different proportions. By combining one-fourth, one-third, one-half, and two-thirds of the potato meal with the flour of wheat, and adding a little salt and yeast, he obtained bread that was well talled, but which had fermented little, was brown, and covered with hard brown crusts. Bread made from the meal of potatoes alone, with the addition of salt and yeast, was eatabile, but heavy, unfermented, and very brown; and apt to crumble into powder. In order to give it greater adhesion, M. Parmentier mixed with the meal a decoction of bran, or a mixture of honey and water, either of which made it lighter and more fermented; it thus also obtained a crust of a golden colour, and became well talled, and sufficiently adhesive. He obtained also well fermented bread, of a good colour and taste, from a mixture of raw potatoe-pulp with mealy wheat, or potatoe-meal, with the addition of yeast and salt. Upon the whole, he recommends, after various trials, the mixture of potatoes, in times of scarcity, with the flour of wheat, instead of employing rye, barley, or oats, which has frequently been done; when grain is altogether wanting, he recommends the use of bread made from a mixture of the amylaceous powder of potatoes and their pulp, fermented with leaven or honey. The meal of this root, diluted with hot water, acquires a tenacious and gluey consistence. This meal, however, gives a grey colour to bread made by mixing it with the flour of wheat; but a mixture of the pulp of potatoes with the flour of wheat does not produce brown-coloured bread. M. Parmentier made bread very much resembling that of wheat, by mixing four ounces of amylaceous powder of potatoes, one dram of musclage extracted from barley, one dram of the bran of rye, and 1/4 dram of glutinous matter dried and powdered. See Potato. M. Parmentier also recommends the use of the horse-chefnut for the purpose of making wholeome bread. With this view he advises taking off the skin, and pressing out the juice, and reducing the fruit into a paste, which, being diluted with water, and strained through a sieve, will yield a milky-coloured liquor, that, on being left to stand, deposits a fine powder. This powder, when dried, has neither smell nor taste, and is very fit for aliment; the mass from which it is procured retaining the bitternes of the fruit. The roots of the bryony, he says, treated in the same manner, yield a similar white powder. By the same treatment, fine, white, infipid, inodorous powders may be procured from the roots of the iris, gladiosus, ranunculus, fumarum, arum, dracunculus, mandragora, colchicum, filipendula, and helleborus; plants which grow spontaneoufly, and in great abundance. The roots of the graminum arvene, which some naturalists have confedered as the original species from which all our grain is produced, are sweet-ta ted; and in order to their being prepared for bread, it is merely necessary to cleanse them, to cut them small, and to dry and pound them. The powder, he observes, does not dissolve in cold water or spirits, but is dissolved in boiling water, which it renders thick and cloudy; and, upon cooling, the whole mass obtains a gelatinous consistence. Upon a chemical analysis, it yields an acid empyreumatic oil, which poiflises a singular odour, resembling that which is perceived on burning the plant.
BREAD.

plant. The spongy residuum, calcined in the air, gives a fixed alkali. From these properties, he infers, that it contains an amylaceous matter, similar to that of grain, which appears to be the nutritive part of vegetables. This amylaceous matter, formed into a jelly, and diffused in water, keeps for a long time without suffering any change. It then turns acid, and at length putrefies. M. Parmentier gives an account of the bread which he obtained from the amylaceous powders of the different vegetables above-mentioned, with the addition of potatoes and a small quantity of common leaven of grain. This bread appeared in general to be well fermented; it was of a good white colour, and free from any disagreeable odour; but to the taste it was somewhat infapid, which he supposes might be corrected by the addition of a proper quantity of salt. In order to guard against a feaon of scarcity, when some of these plants may not be procured, he propouses a method of preparing the matter thus obtained.

For this purpose, he advises, that bread prepared in the manner above-mentioned should be carefully dried, reduced to powder, and kept in a close cask. By this means he thinks it may be preserved for a very long time, and be always ready to make an agreeable and wholesome panade, with the addition of a little butter and salt. In order to determine the degree of nourishment which this alimentary powder was capable of affording, he tried its effect upon himself; and he found that three ounces of it for dinner, and as much for supper, made into panada with water, was a sufficient quantity of aliment for a day. From its discharge by fl. oh, while he used it, he had reason to believe, that it is almost totally alimentary. He concludes with recommending it not only as useful in times of scarcity, but as a proper substitute to tea-biscuit, and as a kind of food well adapted for armies and hospitals. Examen Chymique des Pommes de Terre, &c. Memoire fur les vegetaux qui pourroient suppler en temps de difette a ceux que l’on employe communement a la nourriture des hommes, &c.

In order to make bread of turnips, the following method is recommended in the “Musee rutileum et commerciale.” When turnips are plentiful, a number of them should be pulled, washed clean, pared, and boiled. When they are soft enough for being mashed, the greatest part of the water should be pressed out of them, and they should then be mixed with an equal quantity in weight of coarse wheat meal. The dough may then be made, in the usual manner, with yeast or barm, salt, water, &c. It will rise well in the trough; and after being well kneaded, it may be formed into loaves, and put into the oven to be baked. The peron who made this experiment had other bread made with common meal in the ordinary method. The turnip-bread was baked rather longer than the other. When they were drawn from the oven, a loaf of each sort was cut; and, upon examination, the turnip-bread was sweeter than the other, not less light and white, with a flight, but not disagreeable, taste of the turnip. When it was tasted 12 hours after, this taste was scarcely perceptible, and the smell was quite gone off. After an interval of 24 hours, it could not be known that it had any turnips in its composition, although it still had a peculiar sweetish taste. After 24 hours, it appeared to be rather superior to bread made only of wheat flour; it was frether and moister; and, after a week, it was full very good.

Rice will serve the purpose of making very good bread; and the method practised in Carolina is as follows: The grain is first washed by putting it in a vessel and pouring water upon it, then straining it; and changing the water until it is sufficiently cleaned. The water is then poured off, and the rice placed in an inclined position to drain. After being sufficiently drained, it is put, while damp, for the greater facility of pulverization, into a mortar, and beaten to powder; it is then completely dried, and passed through a common kitchen hair-dye. The rice flour, thus obtained, is kneaded with a small proportion of Indian corn-meal, and boiled into a thickish consistence; or it is sometimes mixed with boiled potatoes; and a small quantity of leaven and salt is added to the mass. When the fermentation has been sufficiently excited, the dough is put into pans, and placed in an oven to be baked. By this process a light wholesome bread is made, which is not only pleasing to the eye, but agreeable to the taste. See Rice.

In Norway, they have bread made of barley and oatmeal, baked between two flones: and Bartholin says, that it keeps 50 or 50 years, and that the older it is, the more agreeable. For their great feasts they use the oldfet bread; and at the baptism of a child, they have bread, which had been baked probably at the baptism of the grandfather.

Dr. Townsend, in his “Travels in Hungary,” has described the mode of making excellent bread without yeast, as it is practised at Debretzin in that country. The flour used for this purpose is made in this manner: Two good handfuls of hops are boiled in four quarts of water; this is poured upon as much wheaten bran as it will moisten; and to this are added four or five pounds of leaven. When the mass is warm, the several parts are well mixed by being worked together. It is then deposited in a warm place for 24 hours, and afterwards divided into small pieces, about the size of a hen’s egg, or a small orange, which are dried by being placed upon a board and exposed to a dry air, but not to the sun; when dry they are laid by for use, and may be kept half a year. The ferment thus prepared, is applied in the following manner.

For a baking of fix large loaves, six good handfuls of these balls are dissolved in seven or eight quarts of warm water; and this water is poured through a sieve into one end of the bread-trough, and after it three quarts of warm water, the remaining masses in the sieve being well pressed out. The liquor is mixed up with flour sufficient to form a mass of the size of a large leaf: this is strewn over with flour, the sieve with its contents is put upon it, and the whole is covered up warm, and left till it has risen enough, and its surface has begun to crack; this forms the leaven. Then fifteen quarts of warm water, in which six handfuls of salt have been dissolved, are poured through the sieve upon it, and the necessary quantity of flour is added, and mixed and kneaded with the leaven; this is covered up warm, and left for about half an hour. It is then formed into loaves, which are kept in a warm room for half an hour; and after that they are put into the oven, where they remain two or three hours, according to the size. The great advantage of this ferment is that it may be made in large quantities at a time, and kept for use; and on this account, it might be useful on board of ships, or in camps for armies in the field.

The quantity of bread allowed a soldier for his day’s subsistence is called a ration.

For armies the bread is either baked in the park of provisions in the camp, or in the town near the army; for the conveniency of ovens, an army ought always to have at least four days bread before-hand. In some cafes, the dillence of the places from whence bread is to be had, or the army’s march from one country to another, obliges the general to distribute bread for fix, or even for eight days: a thing never done without absolute necessity; by reason of the abuse which some soldiers make of it, who sell their bread without regard to future subsistence. For long marches, the
through an enemy's country, they sometimes, instead of bread, make bilkets.

Bread, in Domestic Economy, serves as a nutritive aliment, in all countries where it can be obtained. The farinaceous vegetables are distributed so universally over the face of the earth, and have become to such a degree the objects of culture, that they are very generally made into bread; and as generally a portion of them is taken into the mouth along with almost every morsel of other food. By fermentation it acquires a more tapioc texture, and becomes more friable, and of course more easily masticable with the saliva, and our other aliments, during the progress of mandicution, which it necessarily retards, and whilst the operation of digestion is performed in the stomach. To these purposes it is adapted by being bulky without too much solidity, and by being firm without too great difficulty of solution. The bread or malt of this kind is bread, made of the flour of good wheat, well fermented, thoroughly baked, with a little salt; whereas that which is not thoroughly baked, well kneaded, and without salt, is reckoned hurtful and unwholesome, as also unleavened bread and cakes baked under the ashes. In general, the lighter the bread the better and more agreeable it is; coarse and barley bread is detestive, commonly purgative, at least to those who are not used to it. "We are willing to own," says Dr. Cullen, in his diffusion of this subject, "that a farinaceous substance, formed by fermentation into a perfect bread, is the most wholesome condition in which farinaceous matters can be employed as a part of our food; and we are ready also to allow, that the unleavened farina, taken in immediate quantity, especially at a certain period of life, or in dyspeptic stomachs, may be the cause of disease: but all this seems to have been exaggerated; for the morbid effects of unfermented farina are truly rare occurrences; and, indeed, the same unleavened farinae are for the most part very well suited to the human economy. However considerable the use of fermented bread may be, the use of unleavened farinae is still very great and considerable amongst almost every people of the earth. The whole people of Asia live upon unleavened rice; and I believe (says he) the Americans, before they became acquainted with the Europeans, employed, and for the most part still employ, their maize in the same condition. Even in Europe, the employment of unfermented bread, and of unleavened farinae in other shapes, is still very considerable; and we are ready to maintain, that the morbid conseqences of such diet are very seldom to be observed. In Scotland, nine-tenths of the lower classes of people, and that is the greater part of the whole, live upon unleavened bread, and unleavened farinae in other forms; and at the same time I am of opinion (says this writer) that there are not a more healthy people any where to be found." In opposition to this fact it has been alleged, that this kind of diet is only safe, when used by robust and labouring people; but Dr. Cullen says, "We give it in this country not only to the farmer's labouring servants, but to our sedentary tradesmen, to our women, and to our children; and all of the latter live and grow up in good health, except a very few dyspeptics who are not free from complaints, which those also are liable to who live on fermented wheaten bread." It is hardly necessary to say any thing of bread in reference to its medical use; however, decoctions, creams, and jellies of bread have been directed in some diverse complaints. Bread, well baked, and infused on strongly boiled in water, imparts to it a deep colour, and a highly agreeable indifferent taste. This liquor, used as common drink, has been sometimes beneficial in a weak lax flat of the stomack and intestines; and in bilious vomiting and purging, or the cholera morbus; of which infalliences occur in the Edinburgh phials, in which no other medicine was used. The use of bread, as an external application, is well known. Mr. Boyle affurds us (Phil. Works Abr., vol. i. p. 34. 39.) that he derived a medicinal from bread stronger than aqua fortis, and which would act even upon glafs itself. See farther concerning bread in the writers on food and cookery; especially in Hen. Nicolai, Traict. de Pane, Dantific. 1651. Fabr. Bib. Antig. c. 19. 6. Cullen's Mat. Med., vol. i. p. 283.

Bread, bonpournichole, or bonpournickel, the name of a very coarse bread eaten in Welfphalia, and many other places. This bread of the Welfphalians still retains the opprobrious name once given it by a French traveller, of bonpournichole, for his borre Nicolot, but is by no means a contemptible kind. It is far from being peculiar to this age or country: it has been known in distant places, and in different ages, and was called by the ancients paris farinae, or parisi impura, from its not being so thoroughly cleaned from the milk or brat, as the fine sorts of bread are. The wretchers of old eat only this sort of bread, to preserve them in the strength of limbs; and we may learn from Pliny, that the Romans for three hundred years knew no other bread: and it has been said, that this coarse bread nourishes more, affinages hunger better, and generates humoura less subject to corruption than the white.

The inhabitants of Welfphalia, who are a hardy and robust people, and capable of enduring the greatest fatigues, are a living testimonio to the salutary effects of this sort of bread; and it is remarkable, that they are very seldom attacked by acute fevers, and those other diseases which arise from an ebulition of the humourous, and a malignant colliquation of the blood, and of the humourous of which it is composed. It is certain that a less strong diet is more proper to weakly constitutions, and people of sedentary lives, than this; but for those who will use the necessary exercise with it, it is easy to see that it is preferable to all other kinds of bread; since it remarkably restores strength, and has another salutary effect, which is, that it renders the belly soluable: this was a quality remarked in coarse bread, and highly commended in it, so early as in the days of Hippocrates.

The Germans make two forts of waters by distillation from this bread; the one with, the other without, the addition of a spirituous liquor: to both which great virtues are ascribed. That without any thing spirituous, is made of the juice of cran-fish, May-dew, rose-water, nutmegs, and saffron, distilled from a large quantity of this bread. This is esteemed a great restorative, and given in hectic habits. The other is distilled from this bread and Rheum wine, with nutmegs and cinnamon. This is given in all the divers orders of the stomack, vomiting, and los of appetite, and other complaints of the same kind, and besides these, there is a spirit distilled from it by the retort, in the dry way, which, when separated from its feidol oil, is esteemed a powerful sudorific, and very valuable medicine, in removing impurities of the blood. Hoffman.

Bread, borje, is made of wheat, oats, and beans, to which sometimes are added aniseed, gentian, liquorice, fenugreek, eggs, and ale; and sometimes rye and white wine are used.

For race-horses, three sorts of bread are usually given with feeses, for the second, third, and fourth fortnights feeding; they are all made of beans and wheat, worked with birn, the difference consisting chiefly in the proportion of the two former. In the first kind, three times the quantity of beans is used to one of wheat; in the second, equal quantities
quantities of both; in the third, three times the quantity of
wheat to one of beans.

Bread, sacramental, in the protestant churches, is com-
mon leavened bread, agreeable to the ancient practice. In
the Roman mass, azymus, or unleavened bread, is used, parti-
cularly in the Galician church, where a flat is provided for
this purpose, called pain a chanter, made of the purest
wheat flour, pressed between two iron plates, graven like
wafer-moulds, being first rubbed with white wax, to prevent
the paste sticking. See Azy mus.

Ecclesiastical writers enumerate other species of bread,
allotted for purposes of religion: as, 1. Calendarium, that
anciently offered to the priests at the calends. 2. Prohibuda-
rias, the fame with capitationis, that distributed daily to each
prebendary or canon. 3. Benedixit, that anciently given
to catechumens before baptism, in lieu of the eucharist bread,
of which they were incapable of partaking. 4. Consecrated
bread is a piece of wax, paille, or even earth, over which fe-
veral ceremonies have been performed with benedictions, &c.
to be set up in an aqua des, or a relic box, and presented
for veneration. 5. Unleavened bread, or azymus. The
Jews eat no other bread during their fasts; and exact search
was made in every house, to see if no leavened bread was
left. The usage was introduced in memory of their Vally
departure from Egypt, when they had no leisure to bake
leavened bread. 6. Stew bread was that offered to God every
Sabbath-day, being placed on the golden table, in the holy
of holes.

Bread of St. Hubert, St. Genevieve, St. Nicholas, &c.
denote cakes sanctified with certain prayers and invoca-
tions of those saints, held by the superstitious in the cure of
hydrophobias, agues, and other diseases.

Bread is also used to denote certain foods made of animal,
or even mineral matters, serving to supply the place of bread.
In divers parts of the North, we read of fish-bread, particu-
larly in Ireland, where dried cod is used for bread, being
first beaten to powder, and made up into cakes. The like
obtains among the Laplanders, whose country affords no
corn; and even among the Crim Tartars. Phil. Trans. No. 102. p. 275. Sh Intl. Hist. of Lapl. ch. 14. In the
lordship of Moscaw in Upper Lusiya, a loft of white earth
is found, of which the poor, urged by the calamities of the
wars which raged in those parts, make bread. This earth,
dug out of a hill where they formerly worked at salfpetre,
when warmed by the sun, cracks, and small globules proceed
from it like meal, which ferment when mixed with meal.
Some persons have lived upon it for some time. Some of
this meal has been kept for more than six years. A similar
earth is said to be also found near Gerome, in Catalonia.

Bread, in a more extensive sense, includes all the neces-
saries of life, as food, raiment, lodging, &c.

Hence the fable is sometimes called, in ancient writers,
the day of bread, by reason the eucharist was then adminis-
trated every Lord's day.

In this comprehensive sense the term bread seems to be used
in the petition of the Lord's prayer. Matt. vi. 11. In this
passage ερεμος σῆμερος does "sufficient bread," or a com-
nption. The word ερεμος is one of the αξεπερατος, and
is found in no Greek author prior to the Evangelist. The
composition is of ερεμος and αρρεβος, g. d. proper, or sufficient for
support, and it is not inapplicable, that ερεμος should by degrees
have coalesced and become ερεμος, as it now stands, in the
MSS. The petition exactly corresponds to that in Agur's cele-

</tbody>
</table>

By the preceding table, if the price of wheat be 5s. a bushel (Winchester measure) and the allowance of the magistrates to the baker for baking, is 1s. 6d., the weight and price of the several loaves will be found opposite to 6s. 6d. in the first column. The weight of loaves of any size may be estimated from that of the penny loaf by simple addition; e.g., the sixpenny loaf weighs six times as much, &c.; and the wheaten loaves are three-fourths of the weight of the household loaves; and if the magistrates allow any of the white loaves of the price of one penny or twopenny, they are to weigh three-fourths of the weight of the wheaten loaves of the same price. The prices of the household loaves are always three-fourths of the prices of the wheaten loaves.

The persons authorized to set the affine weight of bread, when wheat is above the price of 1s. 6d. the highest price of a bushel of wheat, together with the baker's allowance in the table, should observe, that the respective weights of the several affine loaves will decrease in the same proportion as the prices of the bushel of wheat, together with the allowance for baking, increase; and that such weights may be deduced from the present table as in the following examples: 1. Required the weight of the twelve-penny wheaten loaf, when the price of the bushel and baking is 16s. The weight in the above table opposite to 8s. is 5lb. 11oz. 12dwt. But the price of the bushel and baking being now twice as much, the weight of the loaf can only be half what it then was, viz., 2lb. 13oz. 12dwt. 2. Required the weight of the twelve-penny wheaten loaf, when the price of a bushel of wheat and baking is 10s. 3d. The weight, when the price of the bushel and baking is 10s. 3d., is 2lb. 11oz. 14dwt.; and the weight, when the price of the bushel and baking is 16s. 6d., is 5lb. 11oz. 14dwt. and these two added together give 5lb. 9oz. 10dwt. and, therefore, one half the weight at 16s. 6d. is 2lb. 1oz. 13dwt.

For the price of the peck loaf, and its subdivisions, it should be observed, that the price increases in the same proportion as the price of the bushel of wheat, together with the allowance for baking, e.g., 1. Required the price of the peck loaf wheaten bread, when the price of the bushel and baking is 16s. The price of such loaf by the table, when the bushel and baking is 10s. is 3s. 5d.; consequently at 16s. it must be double or 6s. 1d. 2. Required the price of the peck loaf when that of the bushel and baking is 10s. 3d. The price when that of the bushel and baking is 10s. is 6s. 1d.; at 16s. 6s. 4d.; and adding these, we have 12s. 6d. one-half of which, or 6s. 2d. is the price at 16s. 3d. See 39 and 40 Geo. III. 73.

The affine is to be set in avoidance of price; and the prices of grain, meal, or flour, allowed to be made into bread in London, shall be determined by the public sale in the London markets during the whole market, and certified on oath before the court of mayor and aldermen, on some certain day in every week, by the meal-weighers or perforners appointed by the said court; and entered in writing under the hands, in some book provided by the city, and kept at the town-clerk's office. On the next day after such price shall be certified, the affine and weight of all sorts of bread for sale, and also the price, shall from time to time be set by the said court, or mayor, and remain in force until a new affine in London shall be set. As soon as it can conveniently be done, the affine so set shall be made public in the manner directed by the said court. But before any advance or reduction shall in any week be made by the said court or mayor in the price of bread, the meal-weighers or perforners duly appointed shall return the prices of grain, meal, and flour, in writing, to the common hall of the company of bakers, so that the said company may, on the morning of the next day after every such return and entry, and before any affine be set, have an opportunity to offer to the said court or mayor the objections against any proposed advance or reduction. In other cities and towns corporate this business shall be conducted and settled by the court of mayor and aldermen, if there be any, or by the mayor, bailiff, or chief magistrates, or by two juries in such towns and places which have no such mayor, bailiffs, aldermen, or chief magistrates. In places within counties at large, two juries are authorized to set the affine. Bread of different denominations, such as sixpenny, twelve-penny, and eighteen-penny loaves, and peck, half-peck, and quarter of a peck loaves,
loaves, shall not be allowed to be made or sold at the same time in the same place, under a penalty of forfeiting not more than 40s. nor less than 20s. at the pleasure of the magistrate, upon conviction of the offender. After the affife has been set, no alteration shall be made in it till the price of corn alters 3d. a bushel. Officers appointed to make returns, and offenders against the due execution of this act, shall forfeit a sum not exceeding 3l. nor less than 20s.: and dealers in corn refusing to disclose the real prices of grain, meal, or flour, publicly sold, or knowingly giving a false price, shall, on conviction by confession, or the oath of one witnests, forfeit not more than 10l. nor less than 40s. Bakers of bread made of other grain besides wheat, according to order, are required to conform to the affife, on pain of forfeiting not more than 3l. nor less than 40s.

The statute 36 Geo. III. c. 23. contains regulations for making mixed bread, and enacts that persons in any place whatsoever, whether any affife of bread has been set or not, may make and sell peck, half-peck, quart, and half-quartern loaves, made of the whole produce of wheat, deducting only 5lb. of bran per bushel; or made of any sort of wheat flour mixed with meal, or flour of barley, rye, oats, buck wheat, Indian corn, pease, beans, rice, or any other kinds of grain, or potatoes, in such proportions and of such prices as the maker or seller shall deem reasonable. Every loaf of such mixed bread shall have upon it a mark. It is required by 31 Geo. II. c. 29. § 21. that the several sorts of bread made for sale shall be well made, and no allum or mixture in which allum is an ingredient, or any other ingredient or mixture whatever, except only the genuine meal or flour, which ought to be put therein, and common salt, pure water, eggs, milk, yead, and harm, or such leaven as is allowed by those who let the affife, or by any magistrate or justice within his jurisdiction, shall be used in making any dough or in the preparation of bread, on pain that the offender (other than a servant or journeyman), upon conviction by confession, or the oath of one witnester, shall forfeit not more than 10l. nor less than 40s. or be committed to prison or house of correction for any time not exceeding one calendar month, nor less than 10 days, at the pleasure of the magistrate. A servant or journeyman, upon conviction, shall forfeit not more than 3l. nor less than 20s. or be committed to prison as aforesaid. The magistrate before whom such offender has been convicted, may apply the money forfeited for causing the offender's name, place of abode, and offence, to be published in some news-paper, printed or published near the place where the offence shall have been committed. The adulteration of meal, or knowingly exposing it to sale, incurs a forfeit of not more than 3l. nor less than 40s. If bread fold, or exposed for sale, be deficient in weight according to the affife, the offender, formerly liable to the pilory, shall now forfeit not more than 10s. nor less than 6d. for every ounce wanting; and for every defect less than an ounce, not more than 26. 6d. nor less than 6d. such bread being complained of, and weighed before a magistrate within 24 hours after the same shall have been baked or exposed to sale, within the bills of mortality, or within 3 days in any other place. It has been observed, that bread loafs weight by keeping: so Bartholine concludes from some experiments that the diminution was nearly one fourth in fix months. Bakers are obliged under a penalty, not more than 20s. nor less than 5s. to mark their wheaten bread with a large Roman W, and their household bread with an H. No person shall sell bread for a greater price than that afferteen by the affife, or refuse to sell such bread at the stipulated price, under a penalty of forfeiting for every such offence not more than 40s. nor less than 10s. By 2 and 3 Edw. VI. c. 25. if a baker shall conspire not to sell bread but at certain prices, every such person shall forfeit 10l. for the first offence; and if not paid within 6 days, he shall be imprisoned 20 days, and have only bread and water for his sustenance; for the second offence, 2ol. or the pillory; and for the third offence, 4l. or the pillory, and loss of an ear, and becoming infamous. Bread inferior to wheaten shall not be sold for a higher price than household bread, under a penalty of 20s. By 31 Geo. II. c. 29. and 32 Geo. II. c. 18. magistrates may grant warrants for searching houses, in order to examine bread deficient in weight, or unconformable in any respect to the statute and affife, and for seizing the same; and also, upon information given on oath, for searching mills, and other places, where adulterated meal is concealed, and for seizing the same. Every miller, baker, &c. who has in his possession unlawful ingredients for the purpose of adulterating meal or bread, shall forfeit not more than 10l. nor less than 20s. and out of the forfeiture may be published the name of the offender, his place of abode, and the offence in some newspaper, printed or published in or near the place where the offence was committed. Persons obstructing such search and seizure shall forfeit not more than 3l. nor less than 20s.

By a general clause in the act 31 Geo. II. c. 29. § 54. all penalties and forfeitures, when recovered, shall be paid to the informer; and by 32 Geo. II. c. 18. one moiety of such penalties as are not particularly disposed of shall be given to him who shall inform and prosecute; and the other moiety, together with all penalties and forfeitures incurred in the weighing, trying, or seizure of any bread by any magistrate, shall be applied, for the better execution of the act, according to the pleasure of the magistrate. Proceedings under this act are limited within 7 days after the conviction of the offence, by 32 Geo. III. c. 57. The statute 3 Geo. III. c. 11. contains certain regulations and provisions in case no affife is set. By 14 Geo. III. c. 62. a standard wheaten bread was ordered to be made of such flour as is the whole produce of the grain, the bran or hull only excepted, and to be marked S. W. This bread is made and sold, though no affife be set, at the weight and in the proportions following: viz. that every standard wheaten peck loaf shall weigh 17lb. Geo. avoidupois; every half-peck loaf 8lb. 11oz. and every quartern loaf 4lb. 5oz.; and every peck loaf, half-peck loaf, and quartern loaf shall always be sold as to price in proportion to each other respectively; and that when wheaten and household bread, made as the law directs, shall be sold at the same time, together with this standard wheaten bread, they shall be sold in proportion to each other as follows: viz. that the same weight of wheaten bread which costs 8d. shall of this standard wheaten bread cost 7d. and the same weight of household bread shall cost 6d.; or 7 standard wheaten affised loaves shall be equal in weight to 8 wheaten affised loaves, or to 6 household affised loaves of the same price, as nearly as possible. The magistrates may, when they think proper, fix the affise of this standard wheaten bread, according to tables calculated for the purpose. The bakers and sellers of it shall be liable to all the penalties of the former acts. See the tables 39 and 40 Geo. III. c. 18. and c. 74. Barn's Justice, vol. i. and iv.

BREAD. Indian, or Coffafo. See Jatropha ManiHot. Breed, St. John's. See Ceratonia Silica. Breed, savage, panis percosus, a denomination given to trifles.

Bread, sow's, a name applied to the herb Cyclamen.

Bread-room, in a ship, that which is set apart to hold the bread. The boards of the bread-room should be jointed and caulked, and also lined with tin plates, for the greater preservation.
preparation of the bread. It is also proper to warm it well with clothed for several days before the bread is put into it, since nothing is more injurious to bread than moisture.

Bread. *fruit tree*, in Botany. See *Artocarpus*.

Bread-nut. See *Brosimum Alicastrum*.

BREADALBANE, or Braidalbin, in Geography, a district of Perthshire, Scotland, including a tract of country measuring about 32 miles from E. to W. and 13 in its broadest part from N. to S. This mountains country forms part of the Grampian hills, and is supposed to have been anciently called Albania; whence the Highlanders ill denominate themselves Albanich; and the duke of York receives his title of Albany from this place. The name Braid-Albain, in the Gaelic tongue, signifies the highest part, which corresponds with this portion of country, as some rivers that take their rise here, run partly into the eastern and partly into the western oceans. Flax is the principal article of cultivation. Some years back, when premiums were offered for the greatest crops, from 80 to 120 hogheads of lined flax were annually sown; and each peck yielded two flaxes of dreided flax. Next to this, oats and potatoes are mostly cultivated; and from the latter some strong spirit has been distilled, which is found to be cheaper than that made from grain. Bread and barley are also made from this root. Cocon, or the hechen ophaloides, an article of commerce, is obtained in abundance from the rocks, and is sold mostly to dyers. Pennant's *Tour in Scotland*, 4to, vol. iii.

BREADTH. See *Latitude, Dimension, Area*, &c.

Breadth, Hair's. See Hair.

Breadth, Finger's. See Finger.

Breadth, Hand's. See Hand.

Breadth, in Ship-building, the breadth of a ship at any particular place, as the extreme breadth, which is the greatest breadth, being at the main frame, the top-timber breadth, the breadth at the main or running transom, &c. The breadth and curvature of all the frames are laid down on the body plan, or plane of projection; those of the fore-body being on the right hand side of the middle line, and the frames in the after-body being on the left hand side of the fame line; from whence the frames are transferred to the mould loft. See Body-Plan, and Ship-building.

Breadth-Sweep. Of these there are two: the lower and upper. The centre of the lower breadth-sweep is in the line that represents the height of the extreme breadth of the timber. If there is a part of the timber straight, the centre of the sweep will be in the lower line. From this centre extend to the point that limits the half-breadth of the timber in the same line; and with that radius describe a circle downwards, till it comes near the floor sweep. The centre of the upper breadth-sweep is in the line that represents the extreme upper height of the breadth of the timber; from which a circle must be described to pass through the point that limits the half-breadth of the timber in the same line, and produced upwards at pleasure to form the top-timber.

Half Breadth of the Floor, is the distance of the centre of the floor sweep from the middle line in the body plan at the main frame; which will always be less than the distance between the point where the straight line, drawn from the side of the keel to touch the back of the floor sweep, is from the middle line. This line may be called the true half-breadth of the floor, which in sharp ships will be above the rising line.

Half-Breadth Plan, or Floor Plan, or, as it is frequently called, the horizontal plan, contains the several half-breadths of every frame of timbers at different heights; ribbands, water-lines, &c. are also described on this plane.

Height of Breadth lines, are two lines named the upper and lower heights of breadth. These lines are described on the plane of elevation to determine the height of the broadest part of the ship at each timber; and being described in the body plan, limit the height and breadth of each frame at its broadest place. One line serves for both in the half-breadth plan.

Main half-Breadth, is a section of the ship at the broadest place, perpendicular to the floor plan, and represents the greatest breadth at the outside of every timber.

Top-timber half-Breadth, is a section of the ship at the height of the top-timber line, perpendicular to the plane of elevation.

Half-Breadth Staff, a rod about an inch square, and of any convenient length. Upon one side of this staff are set off, from one end, the several half-breadths of all the timbers in the after-body; and those of the fore-body are set off upon the other side. On the other two sides are set off the several heights of the floor; the after-body on one side, and the fore-body on its opposite. Two fides of the staff are marked half-breadths; and the other two fides, heights of the floor.

Break, in Agriculture, denotes, in Norfolk, land ploughed or broken up the first year after it has lain fallow in the sheep-walks.

In Architecture, it denotes a recess, or giving back of a part behind its ordinary range or projection. In which case, they say, a break of pediment, a break of entablatures, whereby it shrinks, as it were, between the columns, is reputed a fault.

Break, Cape, in Geography, lies on the east coast of Newfoundland, and forms the eut point of the entrance into Trinity bay, about 10 leagues southward of Cape Donsa-ventre.

Break-Sea Island, lies without the new passage or north entrance into Dulcy bay, on the west coast of the southern island of New Zealand.

Break-in, among Carpenters, is when they break a hole in brick-walls with their ripping chisels.

Break-neck, Drift-co, in Building, a fault in a stair-case, as when a step is made higher or lower than the rest, and landing-place too narrow, or the like.

Break-water, in Sea-Language, the hull of an old ship, or vessel, funk at the entrance of a small harbour, to break the force of the waves in their passage to the vessels moored within. Jetties, however, where practicable to be built, are employed for this purpose. A break-water is also a fort of a small buoy fastened to a large one in the water, when the buoy rope of the latter is not long enough to reach from the anchor, lying at the bottom, to the surface of the water. The use of this break-water is, therefore, to throw where the buoy swims.

Breakers, a name given to those billows that break violently over rocks lying under the surface of the sea. They are distinguished both by their appearance and found, as they cover that part of the sea with a perpetual foam, and produce a hoarse and terrible roaring, very different from what the waves usually have in a deeper bottom. When a ship is unhappily driven among breakers, it is hardly possible to save her; as every billow that heaves her upward, serves to dash her down with additional force, when it breaks over the rocks or lands beneath it.

Breakers' Point, in Geography, is the south-point of
of Hope bay, on the north-west coast of North America. N. lat. 49° 15'. W. long. 126° 40'.

BREAKING, in Agriculture, denotes the ploughing up of grounds, especially such as have lain some time fallow.

Breaking Bulk, the commencement of the discharge of the cargo of a ship.

Breaking spear is applied to a ship at anchor, when she is forced by the wind or current from that position in which she keeps her anchor most free of herself, and most firm in the ground, so as to endanger the tripping of her anchor.

Breaking up a ship, tripping off the planks, and taking her to pieces, when she becomes old and unserviceable.

Breaking ground, in the Military Art, the beginning of works for carrying on the siege of a place; more especially the beginning to dig trenches, or approaches.

Breaking the angles of a battalion, denotes a military evolu

tion, whereby the four angles turn, and make so many fronts towards the enemy; so that the battalion, which before was only a square, becomes an octangle, and can fire on all sides. This is otherwise called blunting the angles of a battalion; by the French, ennouffer les angles d'un bataillon.

Breaking of measure, in Fencing, denotes a moderate retaining, or giving of ground, in order to avoid the adversary's thrust. Breaking of measure differs much from going back, and losing or yielding of ground; the latter being reputed a great reproach, the former a mark of judgment and adroitness. Some pretend, that a man retiring is obliged to forbear, if his adversary call him to stand.

Breaking of the sea, Breaking of a wave, or the like, on a rock, a bank, or the like, are a sufficient indication to the pilots, that it is not safe mooring there.

Divers machines and structures have been contrived for breaking the force of wind, the stream of water, and the like.

Breaking is also used for the taming of animals, or reducing them from a wild to a tractable state.

Breaking of a horse to the saddle. See Backing, and Tracing. To break a horse for hunting, is to make him acquire the disposition and habit of running. It is a great fatigue to run horses full speed before they are broken.

Breaking herd, among Sportsmen, denotes a deer's quitting the herd, and running by itself, or splitting out from the herd for chase. In which sense, the word stands opposed to herding. A deer when close pursued, is loth to break herd. When a hart breaks herd, and draws to the thicket and coverts, he is said to harbour or take hold.

Breaking up a deer, signifies the opening or cutting it up. This term is applied to the act of cutting open the deer after the chase, that the perquisites of blood and garbage may be given to the hounds.

Breaking of prison. See Prison.

Breaking the legs, crustagium, was an appendage of crucifixion, used no where but among the Jews. See Cross.

Breaking of hemp. See Brake.

Breaking of bread, is sometimes used in Ecclesiastical Writers, for celebrating the Eucharist.

Breaking of wine, among Vintners.—Wine is said to break, when being left some time in the air, in an open glass, it changes colour; an indication that it will not keep.

This is the usual method of trying the goodness of wine, among the merchants and vintners of Paris.

Breaking is also used in trade, for a person's failing or stopping payment. See Bankrupt. Breaking betimes, while there is something left to pay withal, is a mark of honesty; and, generally, entitles the unhappy person to compassion and gentle usage from his creditors, saves his credit, and facilitates his retrieving. A late sensible writer on trade takes great pains to inculcate this precept, break early. Compl. Eng. Tradesman, vol. i. p. 77, 83, &c.

BREAKNECK, in Geography, the name of a hill in America, opposite to Butter-hill, at the northern entrance of the high lands, in Hudson river, about 60 miles N. of New York. The rocks on the southern side of the hill are so situated as to give a tolerable idea of a human face, with a nose, mouth, and double chin, without a forehead.

BREAKSPEAR, Nicholas, in Biography. See ADRIAN IV.

BREF, in Geography, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Montford; 2 leagues S. E. of Montford.

BREAK, head and bay, lie on the east side of the north island of New Zealand; the head is the north point of the bay. S. lat. 35° 45'. It has some small islands before it called the "Hen and Chickens." The name of this bay is derived from the fea-bream, with which it abounds.

BREAK, in Ichthyology. See BRAMA CYPRINUS.

Breaking, to, in Sea Language, to burn off the filth, such as grafs, ooze, shells, or sea-weed, from a ship's bottom, that has gathered to it in a voyage, or by lying long in a harbour. This operation is performed by holding kindled furze, faggots, or such materials, to the bottom, so that the flame incorporating with the pitch, sulphur, &c. that had formerly covered it, immediately loosens and throws off whatever filth may have adhered to the planks. After this, the bottom is covered anew with a composition of sulphur, tallow, &c. which not only makes it smooth and slippery, so as to divide the fluid more readily, but also poisons and destroys those worms which eat through the planks in the course of a voyage. Breaking may be performed, either when the ship lies aground after the tide has ebbed from her, or by docking, or by careening. See these articles.

BREAST, Mamma, in Anatomy. The breasts, which are two in number in the human subject, occupy the anterior and middle part of each side of the chest, and are therefore situated over the pectoralis major muscle. Each of these bodies consists of a gland, to which anatomists give the name of mamma, surrounded by cellular and adipous substance, and covered by the common integuments. In men, and in young girls, these bodies are small; they enlarge in the female subject very considerably at the time of puberty, assuming an hemispherical shape, and pretty firm consistence, which, however, is lost, as the subject advances in years.

The skin which covers these parts is white and soft to the touch, except in the middle, where there is a circular portion of a reddish brown colour, called the areola. From the centre of this projects the nipple, in the form of a cylindrical prominence, with a rounded end, similar in colour to the areola, and covered, like that part, by a more delicate continuation of the skin, which is somewhat wrinkled and irregular on its surface. Both the areola and the nipple are furnished with numerous tuberculous glands, which may be clearly seen through the integuments. The fluid which these secrete, preserves the parts from the excoriation, which they might otherwise suffer from suckling. Under the integuments, we find a considerable quantity of fat and cellular membrane, which surrounds and envelopes the mammary gland, connecting it to the skin in front, and to the pectoral muscle behind, and penetrating into its substance, so as to separate the different portions of the gland from each other.
other. It is this that gives to the breast of a well-formed female their beautiful external form. The substance of the mammary gland presents a flatish body, of a circular form, leaving obvious marks of a division into smaller portions, which cannot be completely separated from each other. It is composed of a vast congeries of small tubes, convoluted and accumulated on each other, and known by the technical name of tubuli lactiferi, or glands. These are gathered gradually forming larger and larger tubules, which approach from all sides towards the angle. The tube becomes very much contracted at the extremity, and in this place passes through the nipple, connected by a cell and inward cellular substance, to terminate on its surface by an aperture, whose size is about sufficient to admit a dog's bristle. The number of these openings is said by Rolpin and Sabatier, to be constantly fifteen: the smaller branches of the apertures, and the consequent difficulty of finding them, have led some anatomists to state their number as less than this. Mekel has found, that when the lactiferous tubes, arising from one of the openings on the nipple, were fully dilated, the mercury would pass into other sets of tubes by anatomising branches. Some anatomists, in the number of whom is our countryman Mr. Cruikshank, have contended for the existence of achial in the mammary gland, which are supposed to afford origin to the lactiferous tubes. The description just given is drawn from subjects, who have died while suckling, or near the time of parturition: at these periods the gland is called into action, its parts are developed, and its structure may be unravelled without difficulty. At other times, the lactiferous vessels become so small as to be imperceptible.

The arterial supply of the breast comes from the internal mammary, and the thoracic arteries: the veins terminate in the thoracic trunks: the nerves are derived from the dorsal pairs: the lymphatics, which may be injected with facility from the lactiferous tubes, pass into the axillary glands in their course to the thoracic duct on the left side of the body, to the right lymphatic trunk on the right side. Sometimes, however, according to the researches of Mekel, they terminate separately in the subclavian veins. On the subject of this article, the reader may consult Haller's Elem. Physiol. tom. ii. Sabatier Traite d'Anatomie, tom. ii. Rolpin de Struara Mammum, 4to. 1764.

The mammary glands secrete the milk, the nutriment of the young animal: for an account of the properties of this fluid, the reader is referred to the article Milk.

Breast, distaff of the, in Surgery. See Excoriation. Abscess, Scirrhous, and Cancer: there are the chief morbid affections to which the breasts are liable: but they may occur likewise in various other parts of the body, and require to be treated on the same common principles, allowing for the different seat of the disorder.

Breast, applied to the correspondent parts of other animals, is more properly called udders, dug, ubera, &c. Breast also denotes that cavity or region of the body by anatomists more frequently called thorax. Though, in propriety, the breast is rather restrained to the anterior part of the thorax where the ribs meet; called also sternum, and pedum in English, popularly, the bosom.

We fancy a flat, a narrow, a flint breast; a broad breast, not high, is ranked among the signs of longevity. Deflections on the breast and lungs are dangerous. Coughs, catarrhs, asthma, phthisis, peripneumonia, &c. are also diseases of the breast. See Cough, and Asthma.

Physicians also speak of a dropp of the breast, hydrops pectoralis. See Dropsy.

Medicines for disorders of the breast are called pectorals. See Pectoral.

Smiling the breast is one of the expressions of penitence. In the Roman church, the priest beats his breast in rehearsing the general confession at the beginning of mass.

Breast-lock. See Sternum.

Breast of a chimney, denotes the fore-part under the mantle or chimney piece, commonly made inclined.

Breast-plate, a Sea Term, a fort of hauteur, or large rope, employed to confine a ship side-ways to a wharf or key, or to some other ship; as the head-falk confines her forward, and the stern-falk, abaft.

Breast-hooks, in Ship-building, are thick pieces of timber, incurvated into the form of knees, and used to strengthen the fore-part of the ship, where they are placed at different heights directly across the stern, so as to unite it with the bows on each side. The breast-hooks are strongly connected to the stem and hawse-pieces by tree-nails, and by bolts, driven from without, through the planks and hawse-pieces, and the whole thickness of the breast-hooks, upon whose inside those bolts are fore-locked, or clinched, upon rings. They are usually about one third thicker; and twice as long as the knees of the decks which they support. The fore-side of the breast-hooks, which is convex, is formed so as to correspond with the place in which it is situated; that is to say, it conforms exactly to the interior figure of that part of the bow where it ought to be fastened; accordingly, the branches, or arms of the breast-hooks, make a greater angle, as they are more elevated above the keel, whilst the lower ones are more incurvated. As it is not necessary that the inner, or concave side of these pieces should retain a regular form, the artificers frequently let them remain as thick as possible, to give additional support to the fore part of the ship, where it sustains the whole shock of resistance in dividing the fluid, or in plunging down into it. It is evident, that the connexion and solidity of the ship in this place, will be reinforced in proportion to the strength and extent of the breast-hooks, so that they may cover a greater number of the head timbers.

Breast-pain, called by the Italians grandezza di petto, is a distemper in horse's proceeding from superfluity of blood and other gross humours, which being disdissolved by some extreme and disorderly heat, return downward to the breast, and pain them extremely.

The signs of the breast-pain are, stiff, staggering, and weak-going with his fore legs. Besides that he can hardly, if at all, bow his head to the ground.

Breast-plate, in Antiquity, a piece of defensive armour, wherewith to cover the breast.

The breast-plate is laid to be the invention of Jason. It was originally made of leather, afterwards of mail, and finally, of a brass or iron-plate. When made of this last matter, there is more particularly called rhinna, by the moderns cut-asis; when made of brass, with a Gorgon's head in the middle, it is denominated agis.

The breast-plate, called also by the Romans pectorale, is frequently confounded with the thorax and loricæ; from both which it ought to be distinguished, as being properly a half-thorax, or half-loricæ, covering only the breast; whereas the thorax invested the body.

As the whole thorax might be a temptation to the soldiery to turn their backs, when equally guarded with their breast, the thorax was thrown away, and the hemi-thorax, or breast-plate, only retained. Polyb. Stratag, lib. vii.

Breast-plate, in Jewish Antiquity, one of the priestly vestments anciently worn by the high-priests. It was a folded piece of the same rich embroidered taffie with that of the epishat, having set upon it twelve precious stones in gold, on
each of which was engraved the name of one of the tribes. These were set in four rows, three in each row; and the whole was fastened at the four corners; those at the top to each shoulder-piece by a golden hook or ring, at the end of a wreathed chain; and those below to the girdle of the ephod, by two blue rings or ribbands, which had likewise two rings and hooks; so that the whole might be tied fast to the garment, without danger of falling off; for they were never to be removed. The Jews say, that if the high priest did, at any time, either through inadvertency, or wilfully, put on one without the other, he was to be punished: hence this ornament was called the **memorial**, to put him in mind how dear those tribes ought to be in his estimation, whose names he wore over his breast. This is also called the breast-plate of judgment, because it had the divine oracle fastened to it. Thus, however, most interpreters have understood the command of God to Moses of adjoining the urim and thummim to the breast-plate. The stones of the breast-plate were divided from one another by the golden partitions into which they were set, and were ranged in the following order, to which the Hebrew names are added, together with the tribe that was engraved on each of them:

**Breast-plate**, in the Mesopotamian, denotes a leathern strap running from one side of the saddle, across the horse's breast, to the other; intended to keep the saddle from slipping backwards in mounting up rising-grounds. It is otherwise called a **ree**, sometimes the **pontil**.

**Breast-plate**, among Artificers, denotes a drill-plate, against which to let the blunt end of the drill.

**Breast-plough**, in Agriculture, a small plough so constructed, that a man may push it before him. It consists of a cutting-iron about eight or nine inches long, with one of its sides turned up to cut the turf, which is fixed to a pole about five or six feet long, forked at the upper end, with a cross handle. It is used in the operation called **burn-laying**.

**Breast-rail**, in Sea-Language, the upper rail of the balcony, or of the breast-work on the quarter-deck.

**Breasts of a saddle**, are part of the bow, being the two sides of it down from the arch or upper part.

**Breast-work**, in the Military Art, is an elevation thrown up around a fortified place or fort, to conceal or protect the garrison, and which is at the same time so formed that the enemy's shot cannot pierce through it.

The terms breast-work and parapet are frequently used indiscriminately; but the former is more applicable in a general sense, a parapet implying more immediately that which is raised upon the rampart of a fortified town. See **Parapet**.

A breast-work is usually formed simply of earth, not only because it may be procured with the greatest ease, and with the least expense, but also because it is liable to fewer objections and difficulties than such as occur in the use of other materials; for if the breast-work was made of stone or wood, the garrison would be liable to have more men killed and wounded by the splinters struck off by the enemy, than by his shot. The fliffer the earth, the better it is for the formation of a breast-work; a if it adhere well, together, and destroying the force of the balls which penetrate it better than any other. A soil of loam or clay is, therefore, to be preferred to all other kinds of earth. In rocky or marshy ground, a covering may be formed of wood-logs, dung, brush-wood bound together, or fascines.

With respect to the height of a breast-work, it should be such that a soldier, standing behind it, cannot be seen by the enemy. If, therefore, the garrison and the enemy are on the same level, the height of six feet is sufficient to cover the defenders; but if the enemy is on a higher ground something must be added; and, in this case, the principles of geometry will easily determine how much it must be augmented in each particular instance, according to the distance of the enemy from the breast-work, the place behind it in which the garrison is to be covered, and the elevation of the ground on which the enemy is posted. If the garrison stands on higher ground, the breastwork need not be six feet high, and the more the garrison is elevated, the lower the work may be. It is here also easy to determine the necessary height, by only considering the intention of the breast-work, which is at all times to shelter the soldiers placed behind it from the fire of the enemy's cannon and small arms. A breast-work should be so strong that the enemy's shot cannot entirely penetrate it. To resist the most powerful attack of field artillery, the thickflaps should be at least 18 feet of good soil, and from 22 to 24 feet in bad. This is the case in actual fortification; but in works called up in the open field, often in the greatest haste, and where we expect to be assaulted only by field pieces, a thickness from 10 to 12 feet is perfectly sufficient. If it is intended only to hold out against insult; or, if the work is erected only for the purpose of concealing the troops behind it, from three to six feet is ample thickness.

If the breast-work is formed of earth, each side must make an acute angle with the horizontal base of the work, otherwise it would fall down. These oblique sides are called the **interior and exterior spires** or **tahs** of the breast-work. As good earth will yield firmer than bad, the base of the spire may be no larger than a chasal or in a sandy soil. Experience shows that good earth will yield when the base of the slope is only equal to half the height; but that bad earth requires a slope equal to the whole height; therefore, when other reasons do not render it necessary to vary from this rule, it may be looked upon for earthwork in general, that if the soil is very good it should be equal to half the height; if middling, to two thirds; and if very bad, the base must be equal to the height. The interior spire should be kept as small as possible, for the convenience of the troops posted behind the breast-work. It is, therefore, usual to make the base on one sixth of the height; and to retain the interior side from falling, a revetment of fascines, hurdles, fods, or even a flone wall, may be made use of. Of these, fascines and hurdles, from the cape with which they are procured and constructed, are the most advantageous in the open field. In a permanent fortify, the inner side of the parapet should be formed of fods. As for revetments of board, or stone, they should never be used in the field, because the former become rotten, and the splinters of the latter might greatly annoy the garrison. The exterior spire, being more exposed to the enemy's fire, is sooner liable to fall, and requires therefore a larger base; but the smaller this is kept, the more difficult it is for an enemy to climb. For this reason, it should always be as narrow as the nature of the soil will allow. If it has a revetment, the rules given
given for the interior slope apply equally to this, except that boards and stone are not here to dangerous to the garrison.

That the troops thus protected by the breast-work may be enabled to fire on the enemy without obstruction, an elevation of earth, called a banquette, is made immediately behind it, which the soldiers mount when they are to fire. This should be raised until the height of the breast-work above is about four feet two inches; that the soldier standing upon it may make use of his arm properly, and fire conveniently over.

If the height of the breast-work is six feet, that of the banquette will accordingly be one foot two inches; and if the breast-work is higher, the banquette must also be raised. To render the ascent perfectly easy, its slope should be very broad, at least equal to, or even double its height. The breadth of the banquette should be three feet or more, according to the number of ranks in which the men are drawn up. The upper surface, summit, or crown of the breast-work, must be made with a declivity towards the country, otherwise when the enemy is advanced within a short distance, he cannot be hit from behind the work. The difference in height between the slopes depends on the thickness of the work. If this is 24 feet, the exterior talus may be two feet lower than the inner; if the breast-work is weaker, the difference must be proportionally lessened. If an eminence, it will be necessary to give the superior slope a greater declivity. Its proper inclination may be easily determined, only taking care that the fire regulated by it is not confined to a single point on the ground, but extends as much as possible. When the breast-work has no exterior slope, but the summit is continued outwards until it meets the surface of the ground, it is a perfect glacis. In this case the base must be much broader than that of a common breast-work; otherwise the work would be too weak, and the slope so steep, that the fire acting in that direction instead of grazing, would bury itself in the ground. Two advantages are derived from a glacis: every point in front of it is exposed to the small arms of the garrison, which is not the case in any other kind of breast-work; and it cannot be destroyed by the enemy's shot, which only strikes into it, the loose earth remaining in its proper place; but it is attended with this disadvantage, that it may be mounted without difficulty.

When cannon are planted behind a breast-work, they may either fire en barbettes, or through embrasures. In the former case, instead of a banquette, an elevation of earth is formed sufficiently large to contain guns mounted on their carriages, and of such a height that their muzzles may reach above the summit. This elevation must be carried to within two and a half, or three feet from the top of the work, and sufficiently broad to afford convenient room for the gun and men attached to it. About ten or twelve feet are allowed for each piece of cannon. The length should be from twelve to eighteen feet, according to the gun, that space may be left behind to prevent its running down in the recoil. An easy slope, called a ramp, is made to every battery of this nature, that the guns may be run up without difficulty. This method, however, is only safe when the enemy cannot bring artillery against the breast-work, or when posted on an eminence; and even then we should endeavour to cover the artillerymen with gabions or sand-bags placed upon the work, leaving an opening of 1 1/2 or 2 feet between them for the month of the cannon. If two or more rows of gabions are placed one before the other, the opening must increase in width towards the front, that we may be enabled to point the gun to either side, as well as directly forwards. When the guns, and men who serve them, are much exposed to the enemy's fire, embrasures are to be cut for them. When several pieces of cannon are placed behind a work, their distance abater should be from 12 to 20 feet. The piece of the breast-work which remains standing between every two is called a merlon. As it is to be expected that the enemy will direct his principal fire against the batteries, the merlons ought to be very strong, and constructed with attention; and as musketry are not used behind them, they may, for the better security of the gunners, be made eight or nine feet high.

To procure the earth for the formation of the breast-work, a ditch is made on the outside of it, by which the enemy has an additional obstacle to overcome in his attempts to approach. In some cases the ditch is behind the work; as, for example, on a very steep hill, where a fosse in front would not render the enemy's endeavours to climb it more difficult, and it is more convenient to make use of the earth within the breast-work. The ditch is made sloping on both sides. The inner slope is called the scarp, and the outer the counterscarp. The width of their bases is determined by the nature of the soil; but to give the enemy all possible trouble in getting in and out of the ditch, both slopes should be as steep as the tenacity of the ground will allow. If the scarp forms one continued surface with the exterior slope of the breast-work, the enemy has the greatest difficulty in gaining the summit; but as the scarp in this case subsists too great pressure, it would soon give way, and a considerable part of the work with it. Even should the scarp stand firm, the earth must constantly fall from the breast-work into the ditch, and fill it up to our great disadvantage. To prevent this, the breast-work is thrown up at a small distance from the edge of the ditch, thereby leaving a free passage between them, called a berme. This certainly facilitates the enemy's mounting the breast-work; but to diminish this disadvantage, it should be made as narrow as possible. The size of the ditch is regulated by that of the breast-work. The requisite quantity of earth may be procured equally, whether the ditch is wide and shallow, narrow or deep; but the removing it is easier by the latter mode, and the enemy will also have greater difficulty in crossing the ditch. In low ground, however, this cannot always be done; and the ditch must at all times be sufficiently broad not to be leaped across. It is usually 10 or 12 feet wide; and, wherever the situation allows, at least 5 feet deep; but if those dimensions will not furnish the necessary quantity of earth, an augmentation must be made either of the width or depth, and sometimes of both.

A breast-work, constructed according to the foregoing rules, covers our garrison against the fire of an enemy, and enables us to fire on him with tolerable security during his march towards it. Notwithstanding this, if he is resolute, and not to be deterred by the loss of a few men, and as there is no particular difficulty in surmounting the ditch or breast-work, we have ultimately no superiority over him, and must therefore have recourse to other obstacles to impede his progress. These are natural and artificial. Certain natural obstacles render the access to a place extremely difficult; such as when the breast-work is behind a river, canal, or morasses, too deep for the enemy to wade through; or when it is situated in rocky ground, or on a high and steep hill which cannot well be climbed by a body of men in any regular order. Here there is no absolute necessity for a ditch; and provided the breast-work covers us from the enemy's fire, it may be considered as perfect. Artificial obstacles are, 1. Palisades, which may either be fixed in the open field in front of the ditch, or in the ditch itself, sometimes in two rows, or laillly upon the banquette, where they occasion excessive inconvenience to the enemy, and afford essential protection to the garrison. 2. Frolies, buried in the exterior slope of the breast-work, their points inclining a little downwards. Where there is also a row
of palisades upon the banquette, these occasion much ob-
friction to the enemy in his endeavours to mount. 3. Che-
vaux de friz, planted along the middle of the ditch, where
they render the passage extremely difficult, especially if
they stand behind a row of palisades. 4. An abatis of
trees cut down and arranged on the outside of the ditch,
along the whole front of the work. When the branches
are well intermingled, and the trunks buried obliquely
in the earth, or fastened down by iron pickets, they cannot
be removed without great difficulty. The abatis should
lie under the fire of the breast-work, and therefore ought
not to be more distant from it than 200 or 250 yards.
5. Trous de loup placed chequerwise in front of the work,
about 16 or 20 feet from the counter-scarp. Three rows
of them present at all times a formidable obstacle, as they
cannot be passed except by each man singly, which causes
the enemy to remain a long time exposed to the fire from
the breast-work, and to form under it at a great hazard.
6. Crowns' feet scattered along the bottom of the ditch,
or in the ground in front of it; or, where they are wanting,
a number of flakes, capped and pointed with iron, may
be driven into the ground. 7. An advanced ditch about 30 yards
in front of the first. This, if filled with water, or embanked
from the breast-work, presents a considerable obstacle; but,
otherwise, only affords the enemy a place of shelter, where
he may rest some time in security, and from thence make
the remainder of his way to the work in great haste, so that
it becomes a detriment instead of an advantage. 8. An
artificial inundation of the country in front of the work,
effected by means of dams. This, if five or six feet deep,
and properly under the fire of the garrison, is an amazing
and obvious advantage; but the work is so laborious, and
requires such a combination of circumstances to render it
effectual, that it is rarely executed in the field. 9. Fou-
gaffis, or small mines, placed about eight or twelve yards
from the ditch, and sprung when the enemy is marching over
them towards the breast-work. These occasion great dis-
order; and as soldiers have a great dread of mines, and
anxiously avoid an attack upon any spot they conceive
undermined, are an excellent security against the attacks of
a superior enemy.

Previous to the elevation of the breast-work, its entire
plan must be traced or marked out upon the ground, in
such a manner that the workmen may afterwards be enabled
to calculate the thickness of the work and breadth of the
foffe. In computing the length of the breast-work, two
feet are allowed for each file of men; and as troops are
usually formed two deep for its defence, the length will be
equal to the number of men; ten feet are allowed for a
small gun, and fourteen or sixteen for a larger. Thus the
length of a breast-work for 250 men, and four field-pieces,
should be 290 feet. In excavating the ditch, three work-
men are allowed to every eight feet in length; and when
in a clayey or gravelly soil, to every three men with tholeves,
one with a pick-axe should be reckoned, to loosen the
ground. The breast-work itself, and every thing imme-
diately belonging to it, should be erected entirely by the
troops. A work with a revetment of lofs may in general
be completed in a day, provided there is a sufficient num-
ber of workmen. But if it is to be formed with fascines, or
palisaded, it will require two days; and if there be likewise
to be frizis, fougaffis, trous de loup, &c, three may not
be sufficient. Under the articles Rampart, Fosse, Rev-
tement, Fascines, Fougaffes, Palisades, &c, the
reader will find the construction of the different parts of
a breast-work more fully explained.

In Plate IV. Fortification, fig. 1. a, b, c, is the banquette; c,
d, the interior slope or talus; e, f, the summit of the breast-
work; f, g, the exterior slope or talus; j, g, the berme; p, k, the
scarp; l, i, the fosse; k, l, the counter-scarp; m, the
glacis.

Fig. 2. is a breast-work frizised and palisaded, seen in
profile; a, is a row of palisades planted upon the banquette;
b, another of fougasss, buried in the exterior talus of the
breast-work; c, chevaux de frize in the middle of the ditch
behind d, a row of palisades, fixed at the foot of the coun-
terscarp; e, trous de loup; f, abattis of trees, seen in
profile.

Fig. 3. is a plan of the breast-work; a, is the slope of the
banquette; b, banquette; c, interior talus; d, breast-work;
e, exterior talus; f, berme; g, scarp; h, fosse; i, counter-
scarp; k, trous de loup in three rows; l, abattis.

Breast-work, a Six-term, a list of framing composed of
fianchions and rails, with moulding, and sometimes sculpture.
It terminates the quarter-deck and poop at the fore-
mast end and the after-end of the forecastle.

Breath, the wind or air which is received and ex-
pelled by the mouth and nostrils, in the act of respiration.
In which sense, the word amounts to the same with the
Greek σαπός, and Latin spirītus.

A flinking breath is one of the symptoms usually preced-
ing the access of an intermittent fever. In some persons,
a flinking breath is an indication of the menas being at hand.
It is disputed among the civilians, whether a flinking breath,
called spirit, owing to rotten teeth or gums, should be re-

Breath is more particularly used to denote a strength of
lungs, whereby a man is enabled to hold out without taking
wind for often. In this sense, we say, a long, a short breath.
The ordinary term of holding the breath does not exceed one

For the pearl fisheries they choose slaves who have the belt
breath, or can continue the longest under water without
fetiching their breath. Pechlin has a dissertation express
living long without breathing. J. Nic. Pechlin De Aeras
& Alimenti Defectu, & Vita sub Aquis diuturna, Meditatio
Joel Langelot, 1676. The ancients were very watchful
over the last breath of dying persons; which the nearest
relations, as the mother, father, brother, or the like,
received in their mouths. Pufh. Lex. Antig. voc. Spiritus.

Breath is also sometimes extended to the odorous ef-
fluvia of plants, and even exhalations of minerals.

Breathing. See Respiration.

Fighting a cock to breathe him, is called Sparring.
To breathe a running horse, and bring him to his wind,
they gave him a Heat.

Breathing, exsuffatio, a ceremony in Baptism.
Breathing, short. See Asthma.

Breathing, difficulty of. See Dyspnea.

Breaute', in Geography, a town of France, in the
department of the Lower Seine, and chief place of a canton
in the district of Le Havre, 31 leagues N.E. of Montvil-
liares.

Brebes, Brebers, or Berbers, a denomination that
distinguishes an ancient tribe of Africans, who are settled
in and about the greater and lesser Atlas, and who inhabit
different parts of Algiers, Barbary, and Morocco. Some
suppose that they are descended from the ancient Sabaeans,
who migrated thither from Arabia Felix, under the conduc-
t of one of their princes; others believe them to be some of
the Canaanites, whom Joshua drove out of Palestine. But
their origin is uncertain. It is probable, however, that they
were very ancient inhabitants of the country, and that they
were compelled by the Arabs or Saracens, who overran the
western part of Africa, about the middle of the seventh cen-
tury, to seek a late retreat among the vall ridges of almost
infrangible mountains which extend through several parts of
this immense country. Whatever be their origin, they are
dispersed over Barbary, to which they are supposed to have
given its name (Barbary), and divided into a multitude of
tribes, under their respective chiefs; most of them inhabit
the mountainous parts; some of them range from place to place,
and live in tents or portable huts, others in scattered villages,
averaging, generally, all intercourse with other nations.
There are reckoned the remnant of all the various inhabitants
of the country; and they carry on a much larger traffic of
trade, hides, wax, honey, iron, and other commodities;
they have likewise some artificers in iron, and weavers.
The Brabes and the Moors form the two principal classes,
comprehending the different tribes that people the empire of
Morocco. The Brabes, as well as the Moors, adopted, with-
out doubt, the Mahometan religion, analogous as it was
to their manners and prevalent customs, on the first invasion
of the Arabs; but they are ignorant, and pay little regard
to any of the precepts of their religion, except to that which
inspires them with a hatred for others of a different profes-
sion. Mahometanism, however, has not affected the ancient
habits and prejudices of these people; for they eat swine's flesh,
and, in those places which have vineyards, drink wine;
elleging, as an apology, that it is of their own manufacture.
In the southern parts of Mount Atlas, they preserve it in earthenjars,
and in barrels made of the trunks of hollow trees, the butt-
ends of which they spread over with pitch, thus keeping it in
caverns, and even in water. In the province of Rif, toward
the north, they give it a slight boiling, which deprives it
of its fumes, and makes it less intoxicating; and perhaps,
they also think, that it is thus rendered congenial to the
spirit of the Koran. Bred in their mountains, the Brabes
maintain their retreat against the Moors, whom, com-
forting with the Arabs, they regard as usurpers.
In these asylums they contrive a ferocity of character and
strength of body, which render them more proper for war
and labour than the Moors of the plain generally are;
and the independence they profess imparts more of character
to their countenances, which is visible to those who reside
long among these nations. Although they are subject to the
emperors of Morocco by religious prejudices, they set aside
his authority whenever they think proper; and, intertreched
in their mountains, it is difficult to attack and vanquish them.
The Brabes have a language of their own; and they never
marry but among one another. They have tribes or castles
among them, which are exceedingly powerful, as to both
their number and courage. Such are those of Gomera
on the borders of Rif, of Gayfian towards Fez, of Timeo ex-
tending along Mount Atlas from Mequinez to Tedia, of
Shavoya from Teld to Diquella, and of Miliboya from
Morocco to the south. The emperor of Morocco retains
the children of the chiefs of these tribes at court as hostages
for their fidelity. The Brabes have no distinction of drets;
they are always clothed in woollen like the Moors; and,
though they inhabit the mountains, seldom wear caps.
These mountaineers, as well as their wives, have very fine
teeth, and exhibit signs of vigour, which distinguish them
from the other tribes. They commonly hunt lions and
tigers; and the mothers have a custom of decorating their
children with a tiger's claw, or the remnant of a lion's hide
on the head, thinking that they thus acquire strength and
courage. Similar superstition, without doubt, induces young
wives to give their husbands the same sort of amulets. The
Brabes and the Sheelu, having a language common to them-
elves, and unknown to the Moors, must both have had the
same origin, notwithstanding the difference that subsists in
their respective modes of life. The Sheelu live on the frontiers
of the empire towards the south; their population is by no
means so great as that of the Brabes, nor are they so ferocious;
they do not marry with other tribes; and, though they practice
many superstitious rites, they are faithful adherents of their
religion. The Brabes count the days of the week in the same
manner as the Moors, and both of them employ Arabic words.
The Sheelu enumerate the days after the same method, but in
their own language. Both the Brabes and Sheelu denote the months of the year like the Moors
and the Arabs, and date from the same era, or the year of the
Hegira. The Koran, and books of prayer of the
Brabes and Sheelu, are in Arabic; and so are their acts and
title-deeds, which are written by their Tailors, or learned men.
Cherici's Morocco, vol. i.

BREBEUF, GEORGE de, in Biography, a French poet,
was born at Tierogny, in the Lower Normandy, in 1618,
and studied polite literature at Caen and Paris. During
his residence at Rouen, where he lived several years, he pub-
lished, in 1676, a parody on the 7th book of the Iliad,
and the first book of Lucan travelled, which latter work
was intended as a satire against the titled vanity of great
lords, and the servile flatterers of their flatterers. He after-
wards laid the foundation of his celebrity by a translation
of Lucan's Pharsalia, which first appeared in 1678. Although
this performance was cenured on account of its dazzling
and hyperbolical sentiments, and inflated language, and of its
consequent tendency to corrupt the taste of young per-
sons, it possessed the attractions of a rich style and famous veri-
fication, and became fashionable even at court, where cardinal
Mazarin excited the hopes of the author by various promises,
which his death prevented from being fulfilled. Disap-
pointed in his expectations from other patrons, he retired to
Venoix near Caen, where he died in 1661. His charac-
ter was modest and gentle; and the last years of his life were
spent in pious exercises, of which we have a specimen in his
"Entretiens Solitaires," a collection of religious poems, in-
ferior in merit to his other performances. A collection of his
poetical works was published in two volumes, containing,
among other pieces, 152 epigrams, written in consequence
of a wager on the single subject of a lady's painting. He
was likewise the author of "Poetical Eulogies," and a

BREBIETTE, Peter, a painter and engraver, who
flourished in 1625, was born at Monte upon the Seine, in
France, and acquired some eminence as a painter; but as an
engraver he is well known. His etchings, which are
spirited, evince genius, and great fertility of invention. His
compositions abound with figures, which, though not cor-
rectly drawn, are well grouped, and executed in a matter-
ly manner. Among others are the following: "St. George's
Martyrdom," from Paul Veronese; "Paradise," from old
Palma; "A holy family, with St. John, whose foot is
upon the cradle," from Raphael; the "Virgin kneeling
by the side of Christ," attended by two angels, from a
design of his own; the "Battle of the Lapithæ," and the
"Death of the Children of Niobe," from his own designs.
Strutt.

BREDINCE, or Bourbince, in Geography, a river of
France, in the department of the Saone and Loire, which
issues from the lake of Longpseud, in the district of Mont-
cenis, and joining the Arroux, discharges itself into the
Loire, near Digoin.

BRECCA, from the Fr. breche, in some ancient deeds, is
used to denote a breach or decay. See Breach.
BRECCIA. The term breccia was invented by the Italian naturalists and builders, to denote those varieties of marble which are composed of angular fragments cemented together by calcareous spar, or any other natural calcareous cement of a different colour from the fragments. Some French mineralogists have adopted the word, but have considerably extended its meaning. By breche they understand any mineral aggregate composed of angular fragments, cemented together into a compact mass, and divide it into sub-species from the nature of the fragments; hence they have calcareous breche, siliceous, argillo-calcareous, magmagnan, &c. The breche, therefore, of the French differs from porphyry in the compacted pieces not being crystals, but merely casual fragments, and from conglomerates (a term borrowed from our pudding-stone), in the pieces being angular instead of rounded.

BRECEY, in Geography, a town of France, in the department of La Mance or the Channel, and chief place of a canton in the district of Arraches. The town contains 2097, and the canton 9061 inhabitants. The territory includes 1352 kilometres and 17 communes.

BRECHEN, Lower, a small town of Germany, in the circle of the Upper Rhine, and electorate of Treves, surrounded with walls, and made a town in 1369: 16 miles W.S.W. of Wetzlar, and 78 E.N.E. of Treves.

BRECHIN, an ancient and large town of Forfarshire, Scotland, is seated on the declivity of a hill, and consists of one large, two smaller streets, with a detached row of houses at the foot of the hill. This royal burgh, in conjunction with four others, sends one member to parliament. It was formerly a rich bishopric, founded by David I. about the year 1150, and at the reformation its revenues in money and kind amounted to 700l. a year. The Culdee's had a convent-house, whose abbots witnessed the grant made by king David to his new abbey at Dumferline. Some ruins of this house still remain, in a place called the College Wynde. An hospital was founded here by William de Brechin in 1256, of which some fine ruins were standing in the time of Mr. Pennant. Here was also a cathedral church, which has suffered much dilapidation, but its southern aisle is converted into the parish church. At its north-western angle is a handsome square tower with a short steeple, and near the southern side is a singular round-tower. This ancient structure corresponds with many similar buildings in Ireland; and it is remarked by antiquaries that they are peculiar to that island and Scotland, though only two remain in the latter country. Their origin and appropriation have never been satisfactorily accounted for, though many ingen-ious dissertations have been written on them by different learned antiquaries. The height of this at Brechin, from the ground to the roof, is eighty feet; the inner diameter, near the bottom, eight feet; and the thickness of the walls seven feet two inches. At the top its diameter is seven feet eight inches, and its circumference forty-eight feet. The top has been covered in, and terminated with a small spire, which has four windows. Near the top of the tower are also four original windows, and towards its bottom are two arched recesses, ornamented with religious sculptures; among which are the Crucifixion, with figures of the virgin Mary, St. John, &c. See Tower, round. Archologia, vol. ii. 83. Ledwich's Antiquities of Ireland.

Brechin had formerly its baronial castle, which was built on an eminence a little south of the town. It underwent a long siege in the year 1303, when it was gallantly defended against the English under Edward III. by its brave governor Sir Thomas Maule, who, after twenty days resistance, was slain by a stone cast from an engine, and the garrison immediately surrendered. This town is also remarkable for a battle fought here in the great rebellion in 1452.

The trade of this place consists principally in linen and yarn, which gives employment to many of the poor women. Here is also a bleach-field, and a considerable tannery. Brechin is 64 miles N.E. from Edinburgh. Pennant's Tour in Scotland, vol. vi.

BRECHT, a town of the eastern part of Brandenburg, now the French department of the Deux Noyes, and chief place of a canton, in the district of Anvers or Antwerp. The town contains 3412, and the canton 8800 inhabitants; the territory comprehends 2554 square kilometres, and 87 communes.

BRECKBERG, or Beringden, John, in Biographia, a painter of landscapes, conversations, and portraits, was born at Haarlem in 1637, according to Houbraken, but according to D. campenhout, in 1643, and studied after nature on the borders of the Rhine, where he sketched those views which he proposed to introduce into his landscapes. Having made himself a competent master in this style, he studied and practised the painting of figures, taking his models from nature. His subjects, however, were of the lowest kind, such as boors, husbandmen, shepherds, and inn-keepers, introduced into his landscapes, and represented also at their feasts, dances, or conversations, which he composed in the manner of David Teniers. His pictures were well handled, and agreeably coloured; and some of them were much esteemed. Ambitious of visiting the court of the elector palatine, who had been represented to him as a magnificent patron of persons of his profession, he accompanied his brother Gerard thither; but being at a loss for a proper introduction, he and his brother finished two pictures, in which they painted the portraits of the elector, and of his principal attendants, which were striking engravings, as they had observed them in the chase; and they then prevailed with an officer of the household to place them in a gallery, through which his highness always passed on his return from hunting. The fratsagem succeeded; as the prince observed them with surprize and satisfaction; and the artists were ordered to be brought to court, where they were honourably received, paid liberally for their works, and presented, among other donations, with two medals of gold. Job died in 1698. Pilkington.

BRECKBERG, or BERINGDEN, GERARD, brother of the preceding, was born at Haarlem in 1615, and painted many pictures in concurrence with his brother; but his usual subjects were views of churches, convents, nobleman's houses, and magnificent structures, which he adorned with small figures designed after nature, and intended for his compositions. His works were much esteemed; but as he was advancing to reputation, he was unfortunately drowned in a canal on his return home from an evening party of friends. This event happened in 1693. Pilkington.

BRECKFELD, in Geography, a town of Germany, in the circle of Westphalia, and county of Mark; 26 miles N.N.E. of Cologn.

BRECKNOCK, a township of America, in Lancaster county, and sole of Pennsylvania.

BRECKNOCK, or BREECKNOCK, is the principal and county town of Brecknockshire, South Wales. It is situated in a most romantic part of the country on the banks of the rivers Usk and Hodny, whence its ancient name was Aberhodny. During the days of chivalry and papacy here were a castle and a monastery, both of which appear to have been extensive and important. They were built in the reign of Henry I. by Bardsar de Newmark, a Norman lord, who obtained great possessions in this part of the country, and perpetuated his name by founding several religious houses. This town was particularly distinguished by.
by his institutions; among which were two priories appropriat
ed respectively to Benedictines and Dominicans. One of
these was converted into a college by Henry VIII., and the
principal building of the other is now a parish church. The
remaining fragments of the college prove that it has been an
extensive and grand pile of building. Part of the keep, and
a tower called Ely-tower, still remain. The latter is so
named from Dr. Morton, bishop of Ely, who was confined
here by order of Richard III., where, in conjunction with
his keeper, the disappointed duke of Buckingham, they
planned the union of the two houses of York and Lancaster,
and the succession of Henry VII. Their plan was com-
dpletely digested, and eventually brought to a successful	terminating, though the projectors of it experienced very oppo-
site fates. The duke, who was the most active in this trans-
action, was detected, seized, and executed; but the more
fortunate bishop escaped from the castle, kept quiet, and
lived to become, in the ensuing reign, a privy councilor,
and was further advanced to fill the metropolitan seat of
Canterbury. The castle is divided from the town by the
river Hodny or Hundy. Its main body, with all the princi-
pal parts, are still to be traced, though the tower just men-
tioned is the only large mass of building that remains to
characterize its architecture and gloomy dignity.

Brecknock was formerly surrounded with an embattled
wall, and entered by four gates, named, according to their
respective situations, East-gate, Well gate, High-gate, and
Water-gate. There was also another gate in the suburb,
called Porttherne S. Marie. The town confiils, at present,
of three principal spacious streets, and, according to Mr.
Malkin's statement, “is one of the best built in Wales,”
though some of the smaller streets, occupied by poor inha-
bitants, are “miserably deficient in general arrangements.”
The trade, though not very considerable, is progressively
increasing since the completion of its canal; and some ma-
ufactures of woollens and hats are established on a respect-
able scale. “Brecknock,” observes Mr. Malkin, “appears
in most respects to be a very desirable residence, and is much
inhabited by clergy and gentry of independent fortunes.

The number of spacious and modern-built houses is greater,
in proportion to its size, than perhaps in any town of Wales.
The markets are well, but not very cheaply, supplied. The
broken summit of the mountains round, continued into
Monmouthshire in regular lines; the dismantled towers of
Aberhodny, with its mouldering walls in wild and various
ruins, while the picturesque compactness of the modern
buildings is favourably concealed, render this one of the most
striking situations, near any town in the principality.” The
situation of the priory and castle, with the secluded and in-
teresting walks formed near these ruins, are peculiarly de-
lightful, and invariably attract the attention and admiration
of all strangers. Brecon is a borough, and returns one
member to parliament.

Here were buried the three bishops of St. David's, Main-
waring, Lucy, and Bull. In the town and its vicinity have
been found several Roman antiquities, with coins, &c. and
some large intrenchments are to be seen on the neighbouring
hills; but the most remarkable fortification is Y-Gaer, about
two miles N.W. from the town. This was probably occu-
pied, if not made, by the Romans. It is seated on a gen-
tle eminence, overlooking the river Usk; parts of its walls
remain; and within the area of the camp some Roman
bricks have been found, similar to those at Caerleon, with
the inscription LEG II AUG. Contiguous to the camp,
in the middle of a highway, is a rude carved pillar, about
six feet high, called Men-y-Marian, or the Virgin's
Stone. Another fragment of Roman antiquity is a tepul-
chral pillar, noticed by Gibson and Gough, standing up-
right by the road-side, with a defaced inscription, of which
only the word VICTORIN is legible.

Brecknock consists of three parishes, and contains 540
houses, and 2,576 inhabitants. It is 17½ miles west from
London, and has two weekly markets on Wednesdays and
Saturdays, and four fairs yearly. Evans's Cambrian Itin-
erary, 8vo. 1804. Malkin's Scenery, Antiquities and Bio-
graphy of South Wales, 4to. 1804. Gough's Edition of
Camden's Britannia, vol. ii.

BRECKNOCK Canal, in Inland Navigation, joins that from
Monmouthshire, eight miles and a half from Newport, and
about one from Pontypool. It crosses the river Avon, and
passes the high ground by means of a tunnel 220 yards long,
and, inclining towards the river Usk, passes Abergavenny.
It then runs parallel with the Usk to the town of Breck-
nock; making a course of nearly thirty-three miles, with
sixty-eight feet rise. A rail-road extends from Abergav-
enny to the canal, one mile in length; and from the canal
at Cwm Clydach to the coal and iron works at Wain Dew,
four miles and three quarters. Another rail-road, from the
canal to Llangroeny, crosses the river Usk, and is in length
one mile and a quarter. The rates of carriage for all kinds
of merchandise, materials, horfes, cattle, &c. are particu-
larly specified by the act of parliament. Philips's History of
Inland Navigation, 4to.

BRECKNOCKSHIRE, deriving its name from Brecon,
a distinguished character in legendary story, who succeeded
it about the year 400, one of the counties of South Wales,
is bounded on the north and east by Radnorshire, having the
river Wye for its natural division. A small part of He-
refordshire also attaches to its eastern limits; on the south-
caft and south the county of Monmouth forms its boundary;
and a small part of Glamorgan, with Caernarvonshire
and Cardiganshire, bound its western and south-western
extremities. The length of this area, north and south, is esti-
mated at twenty-nine miles, and its breadth at the southern
basins about thirty-four miles, making nearly 900 square
miles, and containing about 600,000 acres. This district
is divided into the four hundreds of Builth, Crickhowel,
Dyfnnoch, Merthyr, Penkelly, and Talgarth, and con-
tains 4 towns, and 67 parishes. These, with the hamlets,
are populated by 31,663 persons, and contain 6794 hou-
tes.

This county is described in the following terms by Gi-
raldus Cambrensis, who wrote at the latter end of the twelfth
century, and was archdeacon of St. David's, in which dio-
ce this county is included.

“Breschnianae (fares he, in his Itinerary of Wales) is a
county abounding with corn; and if ever any deficiency
happens, it is plentifully supplied from its neighbour, Eng-
land. It is rich in pastures and woods, deer and herds,
and abounds also with river-fish in the Usk on one hand,
and the Wye on the other; both yielding salmon and trout
plenty, but the Wye greater quantities of the excellent fish
called umbra. It is enclosed on every side, except the north,
by high mountains; having on the west the mountains of
Cant&oacute;bocan; on the south the southern hills, the chief
of which is Cader-Arthur, or Arthur's chair, from its two
summits (it being double-topped) resembling a chair;
and this chair, being on a high and steep place, is by the
vulgar ascribed to the greatest and most sovereign monarch
of Britain, Arthur. On the top of this hill rises a spring,
deep like a well, but square; and though no stream runs
out of it, they find trout in it. These mountains, forming a
barrier to the south, keep out the sun, while cool breezes,
and the native fulness of the air, render the country extremely
temperate. On the east stretch the Tolgar and Ewias hills.”
Previous to the reign of William Rufus, this county appears to have been veiled in its native princes; but in this reign Barnard de Newmarch, a Norman of great spirit, combined with prudence, assembled a considerable body of English and Normans, with whom he invaded this territory, and subdued the inhabitants. To secure his newly acquired posessions, he built castles, and affixed different parts of them to his principal associates. This policy further induced him to marry Nell, grand-daughter of Gruffyth ap Lluevelin, who, proving to be of a most revengeful and abandoned spirit, involved her lord in much trouble, and occasioned her loss to this dynasty. Disinherited, by falsely swearing to King Henry I. that he was a bastard. The lordship progressively passed to Mibi, earl of Hereford, and his sons, next to Humphry de Bohun, to Philip Brute, to Thomas Plantagenet, fifth son of Edw. III., and afterwards to the dukedom of Buckingham, till an attainder veiled it in the crown.

Brecknockshire was the seat of war in 1217, and afterwards in 1233, when Lluevelin came with an army, and destroyed nearly all the towns and castles in the county. At the restoration James Butler, afterwards duke of Ormond, was created earl of Brecknock.

The general aspect of the county is mountainous and grand, affording a sublimity of scenery, interpered with large plots of cultivation, that attaches to it a peculiar character among the strongly marked divisions of South Wales. It is distinguished from Glamorganshire by more level and extensive vales; its mountains are also more continuous, more lofty, and presenting an appearance of hill piled upon hill. Its woods are commonly in very large masses, and the banks of its rivers are luxuriously clothed.

The principal river of this county, next to the boundary one of the Wye, is the Usk, which, taking its rise in the Black mountain, on the border of Caermarthenshire, flows through a fine valley, in its progress to Brecknock.

Agriculture, in this county, is much improved within the last twenty years. Being contiguous to Herefordshire, the good husbandry of which is deservedly noted, many English farmers have purchased estates here, and introduced, with themselves, new and more approved principles of agriculture.

The principal remains of Roman antiquities are in and near the town of Brecknock. Among these there is a causeway running nearly at right angles with the river, and leading probably to the great Roman camp in the neighbourhood. Another Roman road has been discovered near the bridge of Capel Rhyd y Briw, and another on the top of the most frequented mountains. A Roman hypocaust has also been discovered in a field near the county town. Mainkin’s Inn in South Wales, 4to. 1864. Gough’s edition of Camden’s Britannia, vol. ii. Barber’s Tour in South Wales, 8vo. 1822.

Breda, Van, or Breda, Peter, in Biography, a painter of landscapes and cattle, was born at Antwerp in 1630; studied landscape after nature, and adorned his designs with figures, correctly drawn and judiciously grouped. His scenes are generally enriched with elegant Roman buildings, fountains, monuments, and ruins. His style, though inferior, resembled that of John Brueghel. He died in 1691. Pilkington.

Breda, Van, John, a painter of history, landscape, and conversations, was born at Antwerp in 1681, and instructed by his father Alexander Van Breda, who was much esteemed as an artist, with whom he continued, profiting by good example and advice, till he was 13 years of age. Among the capital paintings in the possession of John de Wit at Antwerp, Breda selected those of Velvet Brueghel, which he successfully copied; and he employed 9 years.
whole grand-daughter Joanna transferred it to her convent Engelsbrt of Naflin, whom she married in 1424. In consequence of this alliance it remained in the house of Naflin, till William III. of England, dying without issue, caused it to be left in abeyance. The old castle was begun by Henry of Naflin in 1520; but about the year 1586, William prince of Orange, afterwards king of England, erected the new one, which is a magnificent structure, surrounded by the waters of the Merke. Breda suffered exceedingly in the wars of the sixteenth century. In 1577 it was annexed to the domains of the king of Spain, by the duke of Alva, on account of the rebellion of William of Naflin, prince of Orange. In 1578, the city of Maximilian having offered his mediation for peace, a conference was held at Breda, but it terminated without an agreement between the Spaniards and the Confederates. In 1577 it was delivered up by the garrison to the States; but in 1581 it was retaken by Claude de Berlaimont, and fell into the hands of the Spaniards. In 1580 prince Maurice took it by a stratagem, having sent a party of select men concealed in a boat loaded with turf, by which means the prince was admitted, and the city surrendered. In 1665 it was invested by Spinola, who, well knowing the strength of the place, determined to reduce it by famine, and for this purpose drew trenches round it for the space of four miles, erecting forts and redoubts at certain intervals; the siege was prosecuted by Spinola with the utmost diligence and vigour; and the place was defended, amidst the calamities of famine and disease, with a firmness, resolution, and valour, which did honour to the talents of the governor, Julins de Naflin, the natural son of William prince of Orange. A negotiation at length took place between the besiegers and the garrison; and the result was, that two capitulations were drawn up, one for the garrison and the other for the city, both of which were the most honourable and advantageous that could be devised. These were accepted; and the garrison marched out, after having sustained a siege of 10 months, and having lost two-thirds of their number and an equal number of the inhabitants. Spinola drew up his army to salute them, and, surrounded by his field officers, paid particular compliments to the governor, and commanding officers. He also distributed money among the soldiers, ordered the sick and wounded to be tenderly treated and taken care of; and in the regard paid to the value and merit of his enemies he displayed all the sentiments of a hero. On the citizens also he poured out a profusion of civilities; manifesting his admiration of their constancy and fidelity to a degree, which even alarmed the States-General. In 1677 Henry, prince of Orange, determining to recover Breda, laid siege to it on the 23d of June, and obliged the governor, Omer de Fournin, a very distinguished officer, to surrender, the 20th of October following. The governor and field officers on this occasion were, by the prince’s generosity, allowed all the honours of war; and the officers of the city placed on the same footing as in the year 1625, before it was reduced by Spinola. Fournin paid his compliments, sealed a letter, to the prince; he was received graciously, loaded with praisos and honours, and dismissed with valuable presents, reflecting equal credit on the generosity of the prince and the valour of the governor. After this event the Dutch considerably augmented the fortifications; and yet, though they have been reckoned among the most complete in the Netherlands, Breda surrendered to the French, on the 24th of February 1793, after a short siege of 10 days. However, on the 20th of March following, it was again delivered up to the Dutch by capitulation, and the soldiers were permitted to return to France with safe conduct.

Breda was rendered famous in 1667 by the famous congress which was held there for a general peace: first, between Louis XIV. of France, and Charles II. of England, concluded the 21st of July, by the mediation of the king of Sweden; secondly, between the king of England, and the States-General on the 31st of July, one article of which peace was the cession of the province of New York to the English; and thirdly, on the same day a peace was ratified between the king of England and Frederick III. of Denmark. Breda lies 46 miles south of Amsterdam, and 22 S. S. E. of Rotterdam. N. lat. 51° 37'. E. log. 4° 45'.

BREDIE, La, a town of France, in the department of the Girond.

BREDEMAYERS, in Botany, Willden, 111. Clafs. 

[Text continues with various historical and geographical references, possibly involving maps or diagrams.]
BREED. See Breed.
Much of the success of the grazing farmer depends upon a correct knowledge and judgment in selecting and choosing the several breeds of different kinds of animals that are the most adapted to the nature, circumstances, and situation of his land. See Grazing and Stocking Pastures.

In the smaller kinds of domestic animals, there are likewise different breeds, which will be derived from considering their particular applications and uses in the practice of the farmer.

Bred's Hill, in Geography, an eminence, near Bolton in America, where the Americans withstood the attack of the British troops at the commencement of the American war, and where the former lost five pieces of cannon and 159 men, and the latter lost 1053 men, among whom were nineteen officers who were killed, and seven wounded. This battle is commonly called the battle of Dunker's Hill, from the name of another hill near Bred's Hill. It happened on the 17th of June, 1775.

BREEDING, in Natural History, one of the synonyms of Taurus saxatilis, which see.

BREEDING, in a general sense, is useful for the care of rearing or bringing up the young of divers animals.

BREEDING, in a moral sense, denotes a person's deportment or behaviour in the external offices and decorums of social life. In this sense, we say, well-bred, ill-bred, a man of breeding, &c.

Good breeding amounts to much the fame with what is otherwise called politeness, among the ancient Romans and moderns. Good breeding is nearly allied to virtue, and will, of itself, lead a man a great part of the way towards the same; it teaches him to rejoice in acts of civility, to seek out objects of complaisance, and to be pleased with every occasion of doing good offices. Lord Shaftesbury compares the well-bred man with the real philosopher; both characters aim at what is excellent, aspire to a just taste, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one are formed according to the most perfect taste, and good entertainment of company; of the other, according to the highest interest of mankind; the one according to his rank and quality in his private station, the other according to his rank and dignity in society. Hence seems to have united both characters.

BREEDING, in Midwifery. Immediately after having conceived, a woman is said to be breeding, and this stage of pregnancy continues for the space of three or four months, or to the time of quickening, after which she is said to be young with child, and at seven or eight months, great or big with child. These stages, not of themselves of importance enough to be noticed, are here mentioned on account of some symptoms, peculiar to each of them. The most remarkable of these, and which frequently attacks women almost immediately after conception, is nausea and vomiting, particularly of a morning, and as soon as they rise from their beds; though in some cases, it continues through the whole of the day, feare suffering them to retain any part of their food. It usualy to attribute this symptom to nervous irritation, occasioned by the dilatation of the minute vesicles of the uterus, the stomach sympathizing with the part. As it is so general an attendant on breeding, perhaps, by the shock it gives to the frame, it may be intended to assist in unfolding those vesicles. Whatever may be the cause, vomiting in pregnancy is rather a troublesome than dangerous symptom, and the violence of it may usually be mitigated, though it cannot be entirely quelled, by a moderate and slender diet; and by taking small doses of rhubarb and magnesia, by loosing three or four ounces of blood from the arm, or by going for a short time into the country. It usually ceases soon after quickening, though in some women it continues through the whole time of gestation. Cardialgia or heart-burn, which is, another frequent attendant on this stage of pregnancy, is equally untractable and lasting, and only to be alleviated by remedies and management similar to those recommended for nausea and vomiting. Collivenda, to which women in this state are also subjected, is perhaps occasioned by the loss of the bile, which is thrown up by vomiting, instead of going down through the intestines, where, by its fluxus, it is supposed to keep up the peristaltic motion of the bowels, and thence to facilitate the deficient, and discharge of the feaces. Magnesia and rhubarb, lemons, manna, Epson, and glander's salts, in small doses, are the most convenient and efficacious remedies for obviating this complaint. When the abdomen is so weak as to reject these remedies, recourse may be had to aloes, of which four, five, or six grains, in the form of pills, may be given at night going to bed. The eulogium of giving women a larger portion of food, while breeding, which by the common people is thought to be necessary, as they have then two to support, if not the most frequent cause of the inconveniences here noticed, as attendant on pregnancy, certainly tends to increase and aggravate them, as the abdomen is at that time generally very weak and delicate, particularly in the last months, when the uterus has acquired such a bulk as to press on and irritate the bowels, and consequently to impede the passage of the food.

A moderate diet, air, and exercise, are necessary in every stage of pregnancy. Those women therefore err exceedingly who live at such times too sedentary a life, particularly those who spend much of their time in crowded rooms, at the card-table, &c., as besides the injury done by sitting too long in one posture, which they always keep troublesome to them, they breathe an impure and noxious air, whence proceed headaches, sickness, faintings, and a train of nervous symptoms, which not unfrequently lead on to abortion.

BREEDING, in Rural Economy, the art or science of rearing different sorts of live stock, in the belt and most perfect manner. This is a branch of the art of husbandry, on which great attention has lately been bestowed, but which probably depends on principles and circumstances that are not yet fully investigated or understood. Much improvement has, however, been effected in the raising of almost every kind of live stock, since the nature and means of its support have been better known and more abundantly provided. The greatly increased demand for the animals, either in consequence of their usefulness for the purposes of labour or those of supplying the food of mankind, has probably had much effect in promoting this sort of improvement; as rendering it more an object to the breeding as well as grazing farmers. It has been well remarked by the author of "Practical Agriculture," that notwithstanding much has been done in different districts, in bringing different breeds of different sorts of live stock to a greater state of perfection, much still remains to be effected; and that it is probably far from having reached that point to which it is capable of being carried, by the judicious combination of the best and most appropriate breeds of domestic animals, with the improvements in the cultivation of herbage, or other sorts of green food for their support. To fully explain the means of accomplishing such improvements in every sort of stock, many additional facts and experiments are, however, necessary. All that can be done at present is, perhaps, that of presenting the farmer with a few hints and directions, which may serve as guides in conducting the business.

In pursuing attempts of this nature to any extent, Mr. Middle-
BRE

BRE

dleton has justly observed, great care should be previously taken, that there be a sufficient degree of shelter, shade, and warmth, and at the same time a high state of fertility in the land, with suitable drainage; as it is only by the richness and abundance of food that such changes or improvements can be made in the most advantageous manner, or the flock be carried to any high state of perfection.

Different modes of practice have been followed in the improving of live flock, but the principal are those of crossing the different breeds, so as to supply the imperfections and defects of the one by the merits and perfections of the other; and by uniting the valuable qualities or peculiarities of the same kinds by continuing to breed and selecting the most perfect animals in the same line or family. The former of these methods has been long known and employed; but the latter has, only within these few years, been fully introduced to the notice of the farmer, and is not, probably, yet so much attended to as it would seem to deserve.

It has been commonly supposed, that the practice of crossing the breeds of domestic animals possesses various other advantages, as well as those of preventing the decrease and degeneracy of the flock, on account of the animals being kept from becoming too nearly related to each other. There are many facts, however, which show that the supposition of the degeneracy of animals in consequence of the nearest of their relationship is not so well founded as has been commonly imagined. The complete success of the contrary practice in the management of Mr. Bakewell, who reared his belt flock by the nearest affinities, not only without degeneracy in any respect whatever, but with a continued improvement and amelioration, makes strongly against the opinion; as well as the circumstance of cattle in the wild state, in particular situations, remaining for centuries without the least alteration taking place in their form, or change in their colour or other properties. It has, notwithstanding, been asserted, that in this system of breeding, young flock decrease rapidly in size. If, however, such a circumstance was really apt to occur, it could hardly have been overlooked or disregarded by the very expert and intelligent breeder just mentioned, in his long and very extensive experience of rearing various kinds of live flock, by coupling the most perfect animals of the same line or family.

There cannot be any doubt, however, but that by the method of crossing the breeds of animals much advantage may be derived, especially in what relates to size, and some other properties noticed below; yet it is obvious, that it must require the nicest care, and the greatest circumspection, in order to suit the animals in the most exact manner to the nature of the improvement that is intended, otherwise injury, instead of advantage, may be the consequence. Indeed, from the injudicious and random method in which improvements of live flock, on this principle, have, in general, been undertaken, it does not seem improbable but that injury may often have been produced instead of benefit, by uniting such breeds, as, from the great dissimilarity of their forms, qualities, or other properties, could not have any chance of effecting the purpose with utility. Besides, in almost every district of the kingdom, where the breeding system is pursued to much extent, useful breeds of domestic animals are affected to have been injured by the practice of injudicious crossing, as may be seen in the various reports that have been published by the Board of Agriculture; and lord Somerville, in his excellent view of the system of the Board of Agriculture, has very pertinently remarked, "that to the mountebank doctrines of crossing dissimilar breeds, whom nature in its infinite wisdom had left sojurner, we are indebted for much confusion and mismanagement." It cannot, however, be disputed, but that by pursuing this method with judgment and proper attention, great advantages may often be obtained, especially in regard to bone or size, and the hide or coat, as well as in the improvement of particular parts or points, and probably in what relates to the movement or speed of the animals. The author of "Practical Agriculture," has observed, "as it is in some measure a principle founded in physiological science, and countenanced by the observation and experience of ages, that animals are formed what endowed with the faculty of not only preparing an offspring that has, in a considerable degree, the properties, disposition, and embellishments of themselves, but that in some measure, subject to a similarity of climate; it would appear, that although there may be occasional deviations, the most certain method, and that which has the best foundation in the nature and economy of the animal, in so far as the particular qualities and other properties, besides those that have been just mentioned, are concerned, is to breed in the same line, and, perhaps, in the same family; as by a careful procedure in this way, the expert breeder may not only have the greatest security for attaining that improvement which he is anxious to produce, but can the least risk of deterioration." The success of this practice, it is contended, "has merely been flown in the breeding of the farmer's flock, but also in that of the stocking, as it has been found that pointers and game cocks have been bred with the greatest perfection and superiority in this mode," and that "it is by the fame means that the valuable properties of the race-horse are perpetuated and preserved." "The same thing like-wise," it is added, "takes place in the vegetable economy, the fruit and most perfect productions of this fort being propagated by sowing seed selected from the best and most perfect plants of the same kind, and taking the buds or offsets from the best and most perfect trees of the same species." "There is also another circumstance," continues the same author, "that seems to throw the propriety and superior advantage of this method of proceeding in the breeding of domestic animals, which is that, however much the breeds of live flock may be altered by climate, pasture, and other causes, in what respects their colour and other trifling particulars, their specific characters remain invariably the same. No causes of these kinds have ever been capable of changing any one of the distinct breeds, whether of next cattle, sheep, horses, or hogs, in such a manner as to have the characteristic distinctions of those of any of the others." On these principles it is therefore concluded that "by having recourse to occasional crossing in the above intentions, and the careful selection of the most perfect animals of the same breed or kind, with due attention to confine good feeding, the improvement of live flock may be carried to the greatest perfection." "But as the principal object of the breeding farmer must constantly be that of obtaining such animals as will afford him the highest profit, it may be necessary to ascertain the nature and form of the animal that may be most advantageous in this view, or which pays the best for the food that is consumed, as by this means it will be seen what parts are the most definable or useful in a breed or variety, and what circumstances ought to be attended to, so as to justify its introduction in preference to any other." The properties which seem the most particularly to interest the breeder, in his attempts to improve the different sorts of live flock, are principally those of form or shape, size, disposition, hardiness, quick maturity, nature of flesh, fattening property, milk, hide, aptitude for labour, and the quality of the breed, or, in the language of the art, blood. With regard to form, the notions of breeders have been consider-
considerably at variance; but it would seem that there can only be one perfect form, which must be that which approaches the most to exactness in the shape and proportion of the different parts. This should, therefore, be the principal aim of the improver, whatever the nature or breed of the animal may be.

The writer, mentioned above, conceives, that "in this view a perfectly formed animal should have an exact proportion and conformity in all the different parts; the head neat and compactly formed, being neither too large nor of too great length; the eyes bright and prominent; the neck not of too great length, but somewhat thin, gradually narrowing from the breast towards the head, to which it should be neatly attached; the chest round, wide, full, and of deep girth; the length of the legs well proportioned to the size; the fore ones straight and clean, the hind ones forming an angle at the hock so as to stand well under the loins; the distance between the feet in the different extremities equal; the feet round and even; the hoofs straight; the back and loins straight and broad; the belly firm and capacious; the quarters deep, full, and well fleshed downwards." This would seem to constitute: that "utility of form," which is the chief aim of the most enlightened modern breeders: and it has been suggested as probable, that such a form may be the most adapted to the principal object of the grazier, that of taking on and fattening flocks in the process of fattening; as where animals greatly exceed or fall short of such just proportions of parts, there must be disadvantage either in their being weak and lags disposed to fatten, or of course requiring a larger proportion of food, and more time in finishing the bullocks; or in their being deficient in the general weight and value of the meat, from their not being sufficiently fattened on the belt parts. Mr. Young has indeed observed, in his Eastern Tour, that it has been the constant practice of Mr. Bakewell to procure such animals, whether of the cattle or sheep kind, as were capable of weighing the "most in the most valuable joints," as "there is a great difference between an ox of fifty stone carrying thirty in its flesh, and twenty in coarse boiling ones, and another carrying thirty in the latter, and twenty in the former." The utility of attending to this circumstance cannot be disputed; and it may likewise, in particular cases, be of much benefit to consider the nature of the consumption, in relation to the form of the animal, as where some parts are more in demand than others in the market, and of course fell at higher prices, that should be taken into the account of the breeder, and that shape which is most favourable in this view more particularly attended to.

It is supposed probable, that improvement in these as well as many other points of importance depends upon a just proportion and symmetry of parts in the animals made use of for the purpose. And it is conceived not improbable but that the "excellence of the most valuable parts in all the different sorts of live stock may, in some measure, bear a proportion to the goodness of the form in the animal."

The fine bullocks of shape usually distinguished by the breeder under the term "beauty of form," has been considered as very different from that of "utility of form," and to conduce in a greater roundness of the parts, with a less bony protuberant appearance.

Though it cannot but be a matter of much advantage to bring the shape of domestic animals to as high a state of perfection as possible, yet utility, or what may be termed profit, ought to be more particularly regarded as being the main object of the breeding farmer.

In regard to the second property, that of size, the question does not seem to be yet decided, whether large or small animals pay the hell for the food they consume, nor does it appear capable of being easily ascertained, as it must obviously be influenced by a variety of causes. It is a property that may, however, be definable where the chief object of the grazier is that of feeding to a great weight, especially where the supply of food is rich and abundant, but in other circumstances, it is perhaps not so necessary to be attended to. It is the difference in the quantity of meat afforded by large and small animals, in proportion to the extent and value of the food which they differently consume, that is to be considered. The experience of graziers would appear to rather favour smallness of size, from the animals fattening with more expedition, and paying them better. And the judgment of Bakewell is in support of the same conclusion, as he found that the "smaller the bone, the truer the make of the head, and the quicker in fattening." Mr. Young has also observed, in respect to the large sized breeds of cattle, as the Lincolnshires and Holderness, that, though large, their hides in their bones, they may be fattened with less, but can never pay so much for a given proportion of grists as the small-boned long-horned fowls.

Mr. Knight, an intelligent observer, however, contends that large animals are the most profitable, on the ground that they do not consume food in proportion to their weight, as on putting the question to different breeders, in different parts, he found they were uniformly of opinion, "that the same quantity of food was given to the smallest and the largest beasts of the same age; that the largest, even when not matter of the food, often kept itself in a better condition, and that every thing depended on the disposition to fatten, and very little on the size of the animal." His own experience is likewise in support of the same position. It is notwithstanding allowed that a limited number of large cattle will generally consume more than an equal number of small. This has been clearly shown by the practice of graziers in pole places, as they have found, that with small animals they can often flock nearly in the proportion of two to one. But in the consumption of food a great deal must also depend on the state of the stomach and digestive organs of the animals. There is another circumstance that is necessary to be regarded as being in some measure connected with size, which is that of the quality of the flesh. This, in general, allowed to be the finest and most delicate, in the smaller fowls; which would seem to be really the case from the grain or muscular fibre being smaller, and of course finer. The taste of the epicure also affords a further proof of the same thing, in constantly preferring the meat of small-sired animals of different kinds. On this account it has been commonly supposed that the meat of small-sired animals is worth more, for a given quantity, than that of large ones. Mr. Knight, however, contends, "that if the animal be taken as it stands in the pasture or stall, the contrary is the truth; but when the butcher merely buys what are termed the valuable parts, and receives the offal into the bargain, he will unquestionably, for obvious reasons, give more for two cows of twelve stone each a quarter, than for one of twenty-four. The offal is of much greater value, besides a considerable advantage in the hides. The difference between the weight of the animals, when living, and of the four quarters, when dead, is always in an inverse proportion to their sizes, when their forms and merits are equal; but the bones will then be in proportion to the living weight, and therefore, it is concluded, small animals must be, in this case, most disadvantageous to the con-sumer." However, as the flesh of large animals, from the greater size of their muscles, would appear to be more coarse in the grain; it is probable, that upon the whole, it must fall at a lower price in the market. It has likewise been supposed
It is probable that this property depends in a considerable degree on the nature of the breed, and the manner in which the animals have been reared. It has often been supposed to be denoted by a darknes of colour, and a roughness in the hair; but to these there are numerous exceptions.

It is likely that much importance to the public, as the abundance of supply must obviously be much connected with it. The length of time that different sorts of live stock may be kept with advantage, under different circumstances, has, however, not been yet fully ascertained, but meat cattle may generally, it is supposed, be kept longer with profit to the farmer than sheep. It is evident, however, that the method in which the animals are treated in respect to food must greatly influence the matter, as where they are abundantly supplied at all times, and of course constantly preferred in a thriving state, they will, without doubt, arrive much earlier at a state of maturity, than when the contrary is the case. In all sorts of stock this must invariably be the consequence. It has, indeed, been well observed, by Sir John Sinclair, that where the animals are constantly well fed, a greater progress will be made in three years, than in the common pitching mode can be made in five. The necessity and advantage of not suffering live stock of any kind to be restricted, especially in their more early growth, from the want of due care, food, and warmth, are therefore sufficiently clear, and should never be disregarded by the breeder in rearing of his stock.

In addition to the observations that have been already made on the nature of the flesh of animals, it may be remarked, that its goodness probably in a great measure depends on the breed being a quality inherent in the muscular habitus. Mr. Marshall has indeed observed, in the Rural Economy of the Midland Districts, that there "the grain is clearly understood to depend wholly on the breed, and not, as has been heretofore considered, on the size of the animal." Experiments are wanting to show how far the quality and colour of the flesh of different animals may depend on or be influenced by the nature and quality of the food on which they are fed, and on the breed. The common notion of its being in some degree connected with the size of the flesh of the animal, is most probably without any real foundation. The great deviations that have sometimes been observed in the flesh of animals from the natural appearance, can only be accounted for on the supposition of their being diseased. It is remarked in a late work on practical agriculture, that "in the living state the contents of good flesh are a mellow, elastic, rather firm feel, without any degree of hardness, and in the dead condition a similarity of feel, with a fine grain and fibrous appearance. There may likewise be some difference in the quality of the flesh of animals in proportion as they are more old or young, being in the former case more hard and less tender and juicy than in the latter. The fineness of the grain may also vary according as the animal is male or female, being in general coarser in the former than in the latter. The disposition to fatten readily while young is another property which has some relation to that just noticed; and which greatly interests the profits of the grazing farmer, as where it does not occur, a large proportion of food must often be consumed to little or no advantage. It is well known, that some animals of different kinds, and some particular breeds of different sorts of animals, become readily fit with but a trifling consumption of food, while others that consume in a vastly increased proportion have not the
leaf appearance of attaining such a state; but the principle on which this depends has not been yet fully ascertained. From the little knowledge that has been obtained on the subject, it would seem to be a quality some way or other connected with the smallness of bone. In the experience of Mr. Birkewell and some other intelligent breeders, it was found to depend much upon the goodness of form and the head. But whether it depends on these, or is the consequence of the particular state or structure of the digestive and respiratory organs, it is evidently of great importance to the farmer to have such animals as not only fatten readily, but in such a way as can be supported on the inferior fords of food. The opinion that has been made to the utility of the quality on the score of the overfattening of animals, and the supposition that such fat meat is less useful, as well as less economical in the consumption, is probably without any foundation in truth or just observation, as the grazer has no other means of increasing the quantity of lean meat in his feeding flock, but through the medium of the fattenning property. This quality should of course be constantly kept in view by the breeder in raising of his flock, whatever the kind may be.

The state of the hide or skin is likewise a circumstance that should be attended to in the breeding of animals, as showing, in some degree, their disposition to become fat. When it has a soft, flaky feel there is molly a disposition in the animal to fatten in an expeditious manner, and it is supposed to have an advantage in being more dainty, and of course more adapted to admit a larger increase of flesh. Thick hides may, however, have advantages in cold exposed situations, where warmth is more particularly necessary to the animals.

The quality of furnishing a large supply of milk, with the least possible expenditure of food, is another property in animals that ought not, by any means, to be overlooked by the breeding farmer. How far a separate and distinct breed should be provided for this purpose, or one partly adapted to this use, and partly to that of the butcher, is employed, is a point that has not yet been determined; but as it is well known, that such cows as have much tendency to fatten seldom or ever afford any large quantity of milk; there should probably be a breed exclusively for the purpose of the dairy. Sir John Sinclair has, however, foggested it as probable, "that, by great attention, a breed might be reared, the males of which might, in every respect, be well calculated for the hames; and the females, when young, produce abundant quantities of good milk, yet, when they reached eight or nine years of age, be easily fattened." It is supposed that this would be the most valuable breed that could be produced, and that some of the Scotch breeds have nearly attained such a state of perfection. The capability of performing labour in an easy and proper manner is another property, that, in many cases, demands the attention of the breeder, especially in neat cattle and horses; but, if in respect to the former for of flock, it has not yet been, by any means, decided, whether there be any advantage in the increase of meat by working the animals, or whether there may not be some disadvantage in their growth being retarded by the practice. It cannot, however, be disputed, but that where cattle are made to undergo much labour, they must be a greater length of time before they can be in a proper state to be brought to the market; and it would seem that the growth of the animals must also be lessened; however, as they are capable of being reared and kept at a much cheaper rate than horses, a breed well calculated for this use may, in many instances, be an object of great consequence to the farmer.

The inherent property of a breed, or what is usually termed blood, is likewise a quality that has engaged the attention of the breeder in the raising of live flock. This is most shown in the external appearance, and of course may serve to judge the judgment of the grazer in choosing such animals as may be the best suited to such improvements as he may have in contemplation.

Such are the principal points to which the attention of the breeder should be directed in its attempts at improvements of this nature, as well as the means by which they are chiefly to be accomplished. And it has been remarked by Dr. Dickson, in his System of Practical Agriculture, that "the success of his endeavours, to whatever species of excellence his attention may be directed, must obviously, in a great measure, depend upon the accuracy and correctness of his judgment in choosing those breeds, of whatever for of live flock they may be, that are most adapted to his circumstances; and in selecting such individuals, both male and female, of such breeds, as are the most perfect and exact in their different parts and properties; cautiously continuing to breed from them, without ever suffering the leal intermixture by the adition of thote of inferior qualities; advancing in this way, with the nicest attention to such faults or defects, however trifling, as may arise, to so as to alter and correct them by appropriate pairing in the succeeding generations. And as an indispensible article in this arduous undertaking he must constantly have recourse to the aid of good and abundant keep at all farms, with suitable degrees of shelter and warmth for both the old and young flock; so that they may never decline in flesh or be checked in their growth." This, continues he, "would seem to corroborate the great secret of the important art of breeding live flock, which the superior discernment and unwearied perseverance of a single individual raised to a degree of notice and perfection that has had the happiest effects in bringing the improvement of our domestic animals to a state of excellence perhaps unequalled in any other country." See CATTLE and Live Stock.

Breeding of fowl. See Fish-pond.

Breeding of horses, dogs, &c. See Horse, &c.

Breef-cards, denote a kind of false cards, either longer or broader than the reef, whereby they may be known and distinguished.

Brean, G. V. in Biography, an engraver of some merit, whose time is not ascertained, who worked entirely with the graver, and imitated the style of James de Gheyn, from whom he probably received his first instructions; though he never equalled his master, either in correctness of design, or mechanical execution. Strutt.

Breenberg, Bartholomew, called Bartolomeo, a painter and engraver, was born at Utrecht in 1620, and went, at an early period, for improvement to Rome; where the society of the Dutch painters, called "Batagogels," distinguished him by the appellation of Bartolomao. Among the superb ruins and beautiful objects, in and about this city, he acquired an elegant taste; and he peculiarly excelled in landscapes, which he enriched with historical subjects. The figures and animals, which he introduced, were elegantly disposed, and executed with spirit and freedom; especially when they were not larger than the small size, in which he usually painted them. His manner, particularly with respect to colouring, gradually improved; his touch is light and spirited, his tone of colouring very pleasing, his tints altogether of the Roman school, and his pictures are distinguished both by force and delicacy. The drapery of his figures, which are gracefully proportioned and disposed, are easy and ornamental, and in his smallest figures, the expression
preffion is lively, sensible, and natural. His pictures are exceedingly rare, and highly valued. We have of his etch- ing a few of 21 views, and landscapes, ornamented with ruins, &c. from his own designs. He died in 1660. Pilk- kington and Strutt.

BREESEBACH, in Geography, a river of Germany, which runs into the Ullrutt, 4 miles S. of Weifcnau, in the circle of Upper Saxy.

BREEZE, a shifting wind, blowing from the sea and land alternately, during certain hours of the day or night; only sensible near the coasts.

The sea-breeze, Damper observes, commonly rises in the morning about nine, proceeding slowly in a fine small black curl on the water towards the shore; it increases gradually till twelve, and dies about five. Upon its ceasing, the land-breeze commences, which increases till twelve, and is succeeded in the morning by the sea-breeze again. The sea-breezes rule by day, and the land-breezes by night; so that, dividing their empire, they remain as constant as the seasons of the year, or course of the sun, on which they seem alone to depend; but not that they appear sooner or later, stronger or weaker, in some places than others, and vary the alternative according to the several latitudes, situations, soils, mountains, valleys, woods, and other circum- stances of the countries where they are found.

In some countries, the sea-breezes appear only to be efforts of the general or trade-wind, as at Barbadoes, and in many places between the tropics, where the general wind, if not impeded by mountains or islands, blows fresh in the day time, but, after fun set, the terrestrial exhalations becoming precipitated, produce a new wind, which is not only able to make head against the trade-wind, but to repel it from the coasts.

The sea-breezes do not all come from the same point of the compass, but from different points as the land lies.

In Brazil, and many of the Caribbee islands, they have no land-breeze, especially if the shores lie low, as at Bar- badoes, where the general eastern wind blows from one end of the city to the other, and serves instead of the land- breeze. In other places they want the sea-breeze, especially between the tropics, in coasts which lie weefly, as in the western kingdoms of Africa.

If either the easterly or weefly winds blow fresh, they hinder both the land and sea-breezes in the Mediterranean; of which these are always found the weakest which rise later. In England, in very hot days, and when no other winds are stirring, the like alternation of land and sea- breezes may be observed on our coasts, though with little certitude, any where to the northward of Portugal.

Breezes are more constant in summer than in winter, and more between the tropics than in the temperate zone.

The general cause of those alternate breezes which set on and off the coasts in hot countries, is the greater rarefac- tion of the air by reflected heat, and by fermenting exhalations over the land than over the water: the denser air from the water becomes a sea-breeze in the day; but this air, con- dened again, by the cool of the night, may then occasion a land-breeze.

The caufe of this alternation of sea and land-breezes may be familiarly illustrated by placing a common pewter water- plate in the midst of a large vessel, and filling the former, first with hot water, and the latter with cold, and holding a taper just blown out at the edge of the plate; in which case, the smoke will be observed to gather over the plate which has heated, and of course rarified the superincumbent air; but if this experiment be inverted, and the plate filled with cold water, whilst the larger vessel is filled with hot water, the smoke of the taper, held near the plate, will be seen to move towards the rarified air that rolls over the hot water in the larger vessel.

Breezes differ from easterly, or trade-winds, as the former are diurnal, or have their periods each day; and, besides, they are only perceived near the shore or coast: whereas the latter are anniversary, and blow at a distance from land. Phil. Trans. No. 167. p. 143. See Wind.

BREB, in Brick making, are small ashes and cinders sometimes made of instead of coals, for the burning of bricks. But as this does not so well answer the end, the life of it was prohibited by 12. Geo. I. cap. 35. but allowed by 2 Geo. II. cap. 40; and Geo. III. cap. 49.

BRENNY, in Geography, the name of an ancient dis- trict of Ireland, which included the present counties of Cavan and Leitrim, with part of Longford. It was divided into seven and well, and is frequently mentioned in the history of Ireland, as it was not divided into counties until the reign of James the 1st.

BREGO, a small town of Switzerland, in the Valais, near the river Brone. N. lat. 45° 7'. E. long. 7° 16'.

BREGANCON, a fortnight of France, situated on a small island in the Mediterranean, near the coast between Toulon and St. Tropez.

BREGANZA, a small place of Italy, in the territory of Vicenza, famous for a delicious wine produced in its neighbourhood.

BREGA, a small river of Germany, in the circle of Swa- bia, which joins the Bribach, below the town of Done- chingon.

BREGENTZ, or BREGENTZ, in Latin, Comitatus Brigantii, a county of Germany, in the circle of Swabia, but annexed to the circle of Aulfland, bounded on the north by the territory of Wagen, on the east, by the hithopric of Augsburg, and the county of Tyrol, on the south, by the counties of Phalentz and Montfort, and on the west, by the Rhine and the land of Conflance. It anciently belonged to the counts of Montfort; but in 1451, part of it was sold to the archduke Sigismund for 35,552 Rhenish florins; and in 1523, the other part was sold for 50,000 Rhenish florins, to the archduke Ferdinand. The capital of the same name is situated at the east end of the lake of Conflance; it has several iron works in its vicinity, and an adjoining citadel seated on a mountain, and named Plenerg. To the south of the town is the "Bregenz-clans," which is a strong pass. This town was taken by the French on the 9th of August 1796. It lies 60 miles E. N. E. of Zurich. N. lat. 47° 31'. E. long. 9° 52'. The river Bregen rans into the lake of Conflance near the town.

BREGOLIO, in Geography, a small town of Padmont, in the county of Nice, feated on the river Rodia.

BREGOMA, or FONTANEL, in Anatomy, is a space left between the parietal or frontal bones in the fetus, in which the pulsation of the brain may be felt. There is frequently a similar vacancy between the parietal and occipital bones which is termed the posterior frontal. See Cranium.

BREGNANO, in Geography, a small town of Italy, in the duchy of Milan, seated on the river Svec.

BREGNO, Vald. See BRENA.

BREHAL, a town of France, in the department of the Channel, and chief place of a canton, in the district of Con- tances, 3 leagues S. S. W. of Contances. The town con- tains 1,377, and the canton 14,251 inhabitants: the territory comprehends 177 square kilometres, and 16 communites.

BREHAN LIEUDEAE, a town of France, in the de- partment of Morbihan, 6 miles N. of Josselin.

BREHAI, or BRIER, the name of one of the Scilly islands, lying about 30 miles directly west of the Land's End.
in Cornwall, N.W. of St. Mary, and W. of Trencaw, two other islands. It is mountainous and rocky, contains several barrows and monuments of the Druids, and is inhabited by 30 families. It abounds with sea and land fowls, excellent asparagus, and a variety of medical herbs. N. lat. 50° 12', W. long. 6° 47'.

BREHEMONT, a town of France, in the department of the Isère and Loire; 4 leagues of Tours.

BREHNA, a small town of Germany, in the circle and electorate of Upper Saxony, and in the preforest of Bitterfeld, having both seat and voice at the provincial diets; 12 miles N.E. of Halle.

BREHONS, in Antiquity, hereditary judges belonging to the inferior provincial kings, and also to the nobles or chiefs, among the ancient Irish, by whom justice was administered, and controversies decided.

These fages were a distinct tribe or family, to whom competent lands were allowed in inheritance. One of these seems to have belonged to each sept or tribe; and they had to try causes in the open air, either on the summit of a hill, or on its acclivity, as had been the custom of the Druids; and in such places the Irish continued also to hold their provincial assemblies, where all differences or complaints between district and district, and even private causes of extraordinary importance or difficulty, were heard and determined. To these meetings they came armed, some on horseback, and some on foot; as was usual among all the ancient colonies of the Celts in their public consultations. Brehons' chairs, or mounts, which are supposed to have been appropriated to this purpose, are found in many parts of Ireland. Dr. Ledwich has given a view of one of them, seated on the hill of Kyle, in the Queen's county. Campion speaks of such lawyers in 1,770, who, after the custom of the country, determined and judged causes; to which Stanhurt adds, that they were entirely unacquainted with the English, the canon, and civil law; that their determinations were founded on solid rules, but on precedents functioned by time and usage; and that these were kept profound secrets, by which they acquired admiration, and maintained their influence. An old man, the principal brehon in the part now called Monaghan, is mentioned by Sir John Davies, attorney-general of Ireland in the reign of James I. (see his Tracts), as being summoned before the lord chancellor, himself, and some others, when on a tour through the north, in 1600; and on a solemn promise of its being returned to him, he produced a roll out of his bosom, written on both sides in a fair Irish character, but worn and defaced with time and ill-keeping. Of the rules of the law by which the brehons determined causes, Sir John Davies delivers this opinion: "If we consider the nature of the Irish customs, we shall find that the people which doth use them must of necessity be rebels to all good government, destroy the commonwealth wherein they live, and bring barbarism and defolation upon the richest and most fruitful land of the world. For, whereas by the just and honourable law of England, and by the laws of all other well-governed kingdoms and commonwealths, murder, man-slaughter, rape, robbery, and theft, are punished with death; by the Irish custom, or brehon law, the highest of these offences was punished only by fine, which they called an "crick." He thus describes the mode of imposing it: "For offences and matters criminal, the same was of so heinous a nature, that it was capital; for treason against the chief lord, and murder, were finesable; the fine they called an "crick", which was affessed by the lord and his brehons. In case of treason, the lord had all the fine; in case of murder, the lord had one moiety, and the kindred of the party slain the other moiety; so as they never forfeited their possessions or their lands for any offence. Howbeit their lands were seized by the lords for their fines, until the same were levied thereupon, and then restored. Rape was finesable in like fort; but theft deferred praise and reward, if the sto the nght were brought into the country, because the lord had a share, and the country thereby became the richer. But the theft being committed in the country, and carried out, if the thief were apprehended before his friend made offer of his fine, he was commonly punished with death. But the lord, that his case, might take an "crick," if he would. The brehons, affiled by certain scholars, who had learned many rules of the civil and canon law, gave judgment in all causes, and had the eleventh part of the thing adjudged for their fee; and the chief's lord marshals did executions." Having described the Irish customs of tamility and gavel-kind, he thus concludes: "These are the principal rules and grounds of the brehon law, which the makers of the statutes of Kilkenny did not, without cause, call a "law-culture," for it was the cause of much law-suits and ill-suits. It gave countenance and encouragement to theft, rape, and murder; it made all pilferings uncertain; whereby it came to pass, that there was no building of houses and towns, nor education of children in learning or civility, no exercise of trade or handicrafts, no improvement or manuring of lands, no industry or virtue in life among them; but the people were bred in loquacity and idleness, which had been the true cause of all the mischiefs and miseries in that kingdom." Brehon-laws denote the general maxims, or rules of law, observed by the brehons, and having the force of law throughout all the provinces of Ireland, previously to the settlement of the English.

Several fragments of the leges brehonicse are still extant in public and private libraries. The most complete collection of them belonging to the duke of Chandos, containing twenty-two sheets and an half, close written, full of abbreviated words, and not very legible. This collection, falling into the hands of Sir J. Sebright, was given by him to the university of Dublin, and forms 28 volumes. These laws resemble those of other ancient people, in the order of succession called taurlhal, and in appointing fines for murder and other heinous crimes. From the resemblance of some of them to those of Asiatic countries, general Vannallis has endeavoured to strengthen his arguments in favour of the oriental origin of the Irish; while Dr. Ledwich urges the similarity of the same laws to the laws and customs of the ancient Germans and the northern tribes, in favour of the truth of Spathain's assertion, that the Irish are "Germanorum nepotes," or German origin. Dr. Ledwich asserts, that "the Irish erics are plain transcripts of the Salic and other wergilds in Linenbrog's German codes." The reader, who is dehous of further satisfaction in this inquiry, will find mol in that has been said respecting the origin of the brehons in Dr. Ledwich's "Antiquities of Ireland," and in the "Collectanea de diebus Hibernicis," and other works of general Vannallis. The latter gentleman has published a translation of some parts of the code, in the 11th number of the "Collectanea."

At the time of the conquest of Ireland by King Henry II. A.D. 1172. the Irish were governed by the brehon law; but the laws of England were then received and sworn to by the Irish nation, assembled at the council of Lismore. King John, in the 12th year of his reign, assembled with him into Ireland many able fages of the law; and there by his letters patent, in right of the dominion of conquest, it is laid to have ordained and established, that Ireland should be governed by the laws of England; which lettered patent Sir Edward Coke (1 Salk. 1615) apprehends to have been then confirmed in parliament. But to this ordinance many of the Irish were averse from conforming, and still adhered to
their breton law; so that both Henry III. (A. R. 30.) and Edward I. (A. R. 5.) were obliged to renew the injunction; and at length, in a parliament held at Kilkenny, 40 Edward III., under Lionel duke of Clarence, the then lieutenant of Ireland, the breton law was formally abolished; it being unanimously declared to be indeed no law, but a low custom crept in of later times; and it was enacted, that no English subject shall submit to a trial by this law, on the penalty of high treason. And yet, even in the reign of queen Elizabeth, the wild natives Hill preferred their breton law, which is described by Edm. Spencer (State of Ireland), to have been a rule of right unwritten, but delivered by tradition from one to another, in which oftentimes there appeared a great flaw of equity in determining the right between party and party, but many things repugnant quite both to God's laws and man's. As to the prevalence of this law among the Irish, this writer further observes, that "dwelling as they do, whole nations and septs of the Irish together, without any Englishman amongst them, they may do what they list, and compound, or altogether conceal, amongst themselves, their own crimes." Some writers have spoken of these laws, as if they were peculiar to the Irish, and an evidence of their barbarity; not duly considering, that when they were established, many other nations had similar laws; and that if the English had taken proper pains to introduce their improved institutions, and to settle the country under any kind of regular government, they would, in all probability, have been able, though not without difficulty, to effect it. The civilization and improvement of Ireland seem, however, to have engaged little attention till the reign of James I.; who "proceeded in this work," says Hume (Hill of Great Britain, vol. vi. p. 53.), "by a steady, regular, and well-concerted plan; and in the space of nine years, according to sir John Davies, he made greater advances towards the reformation of that kingdom, than had been made in the 440 years which had elapsed since the conquest was first attempted." The legislative union, referred for the reign of George III. affords a prospect, under regulations preferred by wise, moderate, and judicious counsellors, and enforced by suitable sanctions, of further improvements, conducive to the remedy of the peculiar disorders of Ireland, and to the promotion of the real interests of both countries.

See Union.

BREDDYN-HILL, in Geography, lies on the border of Shropshire, and occupies a large space between Montgomery and the vale of Severn. It consists principally of a coarse argillaceous schistus, blended in some places with small spherical crystals and a calcareous spar. The summit of this hill, near the pillar erected in honour of admiral Rodney, affords a very extensive and delightful prospect, extending over the vales of the Severn, Pernow, and Toned, as far as Plinlimmon, Cader-siрис, and Aran-ber-llyn, whose pointed tops agreeably diversify the line of the horizon. This was a favourite situation of Llewelyn the Great, about the year 1240.

BREIDEMBACH, a town of France, in the department of the Mofelle, 5 miles north of Ditsche.

BREICH, a town of Germany, in the circle of Upper Saxony, and duchy of Croffen; 5 miles S. of Croffen.

BREITENBACH, a town of Germany, in the circle of Upper Saxony, and county of Schweitzburg, seated on a small river of the same name, in the midst of woods, fields, hills, and valleys, with two churches and 400 houses; 14 miles S. of Erfurt. On the river, in its vicinity, is a mine yielding sulphur, alum, and vitriol.

BREITENBURG, a lordship and parochial village of Germany, in the duchy of Holstein, and circle of Itzehoe, seated on the river Stor, 2 miles S. of Itzehoe.

BREITENNECK, a town of Germany, in the circle of Bavaria, which gives name to a lordship, situate in the upper palatinate, and contributing to each Roman month 25 florins, and to each chamber term 35 six dollars. The bifurcation of this river belong to the elector of Bavaria, and the allodium to the counts of Montfort, in which is the town, which has a citadel, and is distant 3 miles N. E. from Dietfurt.

BREITHORN, and BREITLAUENER, praks of the Jungrfan, or Virgin, in the canton of Bern, in Switzer land.

BREITKOPF, John Gottlob Emanuel, in Biography, an ingenious printer, letter-founder, and bookseller of Leipzic, was born in that city, Nov. 23, 1719. In early life he manifested a strong attachment to the sciences, and acquired a considerable acquaintance with the languages, particularly the modern ones. When he joined his father in business, he commenced the study of mathematics, and after the perusal of a work of Albert Durer, in which the shape of the letters is deduced from mathematical principles, according to which the first printing types were formed, he made the improvement of the art of printing a principal object of his attention. Accordingly, he began with delineating the form of types mathematically; and he endeavoured to fashion them according to the most beautiful models, which he could procure by an extensive research among the English, French, Dutch, Flemish, and Italians. By his ingenuity and diligence, employed in this way, he obtained new and improved figures of characters, and had them cast in matrices cut for the purpose. Thus his printing-office and letter-founder acquired very high reputation, as being the most complete in the world, not excepting those of the society "de propaganda" at Rome, and containing punches for 400 alphabets, with an equal number of matrices, and a very copious assortment of ornaments. Whilst he was industrious in prosecuting every mode of improvement, he indulged no mean jealousy in contemplating the inventions of others in a similar way; but, on the contrary, he employed the types of Baskerville, and duly appreciated the value of those of Didot. Breitkopf found by his various and extensive researches, that engraving in wood had given birth to printing; and that the latter had contributed to the improvement of engraving. He was thus led to transfer some particulars, in the province of the engraver, to that of the printer; and with this view he made his first experiment in musical notes, and contrived to represent, by the typographic art, all the marks and lines which occur in the modern music, with no less accuracy than that with which they are represented by engraving. Recurring to mathematical principles, he succeeded, in 1757, in bringing this art to its present degree of perfection. He proceeded to print maps with moveable types, and, in 1776, accomplished, after encountering many difficulties, the object at which he aimed. This, however, he considered as a matter of more curiosity; and such was also another attempt, which was that of copying portraits by moveable types. In 1793, he directed his attention to another object of greater utility; which had long been considered as impracticable; and which large sums had been expended without avail. This was that of printing, with moveable types, the Chinese characters, which are, in general, cut in pieces of wood, so that a whole house is often necessary to contain the blocks employed for a single book. After some trials he at length succeeded; and having sent specimens to the pope, he returned him thanks in the politest manner by cardinal Borgia. His next attempt was that of printing mathematical figures in the same manner; but though he surmounted all obstacles by his persevering exertions, his numerous engagements prevented the completion of his design. Breitkopf directed his attention to the improvement of type-metal, particularly by giving it that degree of hardness, which has been a deafening in founder's art. His work was done by the R. C. press, and was published in 1791.
nes of this kind. He discovered likewise, a little before his death, which happened on the 20th of January, 1794, a new method of facilitating the process of melting and casting; but this he concealed for the benefit of his heirs. From his foundery, which employed 12 furnaces, and 39 workmen, types were sent to Kulla, Sweden, Poland, and even America. He introduced also several improvements in his process, which were freely presented to the inspection of those who visited his printing-house.

Besides his mechanical inventions, which occupied much of his time and attention, his researches into the origin and progress of the art of printing were very considerable, and furnished the materials of a history, which he left behind in manuscript. Of this larger work, he published, in 1774, an account, in a small tractate, containing, among other particulars a refutation of the opinion of those who pretend that printing was first employed at Florence, Wittenburg, or Antwerp. In 1781, he published the first part of a work, entitled "An Attempt to originate the art of playing-cards, the introduction of paper made from linen, and the invention of engraving on wood in Europe." The latter part of this work was finished, but not published, before his death. His last publication was a small "Treatise on Bibliography, &c." published in 1793, and containing extracts from his larger works, with his reasons for retaining the present German characters, and a refutation of some affections respecting typography. Breitkopf was distinguished by his fidelity and perseverance; and devoted his whole life to study and useful employment, with the interruption of only 5 or 6 hours in the 24, which he allowed for sleep. Schlichtegroll's Neurology. Gen. Biol.

BREITZENHEIM, in Geography, a lordship of Germany, in the circle of the Lower Rhine, on the Nahe, near the town of Creutzach, and derived its name from an old castle now in ruins. In the matricula of the empire it is attested at six florins, in that of the circle at 8, and pays to the chamber of Wetzlar 5 rix-dollars, 13½ kreuzers. Its inhabitants are partly Roman Catholics, and partly Lutherans.

BREDAE'S, Sr., a bay on the south coast of the island of Jersey, which takes its name from a village, 5 miles W. from St. Helier.

BRELANDS, a town of Norway, 7 miles W.N.W. of Christiania.

BRELLES, a town of France, in the department of Finisterre, and district of Brest; 3½ leagues N.W. of Brest.

BREM. See BREM.

BREM, a town of Italy, in the Milanese, near the confluence of the Sella and Po, on the frontiers of Montferrat; 28 miles W. of Pavia.

BREMBO, a river of Italy, which rises on the frontiers of the Valtelline, and discharges itself into the Adda, about 8 miles from Bergamo.

BREME, a cape which forms the south-eastern point of the island of Oroonoko, opposite to cape Araya, in South America.

BREMEN, a duchy of Germany, in the circle of Lower Saxony, bounded on the north by the German sea and the Elbe, on the east by Holstein, Luneburg, and Verden, on the south by Verden, Hoya, and Diepholz, and on the west by the Weser, Oldenburg, and the German ocean. Its greatest length is about 60 miles, and breadth about 40. The face of the country is level, and it is almost surrounded by the Elbe and the Weser. The air is cold; but the country is fertile and well-peopled. The Elbe, Orie, and Weser, are bordered with very rich marsh lands; those on the Elbe produce plenty of grain and fruit; those on the Orie are also very productive of grain, and yield a clay for vessels, and a kind of free stone; the flood on the borders of the Weser, besides being fertile in grain, supports likewise large breeds of cattle. Between Bremen and Stade, the country is either a barren sand, or a morass. In order to guard the lands against the inundations of the rivers, dykes and dams have been created, and are kept in repair at great expense; and yet in winter they are frequently so much overflowed, that the inhabitants are obliged to make use of long poles to leap over the ditches and other waters, in passing from one place to another; and the inundations of the Weser in particular are such, that cities and villages appear like so many islands in the midst of a sea. The champagne country has, in some parts, good corn land; the heaths are covered with sheep; and the culture of bees is an object of particular attention. On the moors are dug great quantities of turf, which is exported to Bremen and Hamburg, and used in brick kilns, the glaze-houses, and as fuel in private houses. This country yields likewise much flax. The inhabitants likewise, by their situation between navigable rivers, have been induced to turn their thoughts to trade. They have the reputation of being good folderis; but on account of the marshes and inundations of the country, they are subject to agues and fevers, and are hence led to indulge the habit of drinking much brandy. Reitbeech describes them as yellow-skinned, soft-fleshed, and full of wrinkles; and their small round figures form a striking contrast with the tall Germans of the southern parts. Few rosy cheeks are observed either among men or women.

The duchy of Bremen was formed out of an archbishopric, which was originally a bishopric, founded by the emperor Charles the Great in 787 or 788, of which Willenhad, an Englishman, was the first bishop. In 858, the see was incorporated with Hamburg, as the archbishopric of the northern nations; and the archbishops gradually got into the hands the counties within the diocese of Bremen, and acquired the sovereignty over it. But after the death of the archbishop Roden in 1511, the chapter elected archbishops out of princely families; in 1514, the Swedes made themselves masters of Bremen; and, in 1648, at the peace of Weilphalia, it became a duchy and fief of the empire. In 1675, the duke of Brunswick and Luneburg, in conjunction with the bishop of Munster and some Danish forces, overran this duchy as far as Stade, which place was taken in the following year by the Luneburg troops. The conquerors first thought of sharing the duchies of Bremen and Verden between them; but Sweden kept the whole to herself, except some small part of it, which was restored to the dukes of Brunswick and Luneburg, at the peace of Nimeguen in 1679. During the northern war, the Danes, in 1712, reduced the duchies of Bremen and Verden; and in 1715, Frederick IV. transferred them to the elector of Brunswick, in lieu of the sum of 700,000 rix-dollars. In 1719, by the peace of Stockholm, they were ceded by the crown of Sweden for ever to the elector of Brunswick, together with all their rights and appurtenances, in the same manner as they had been granted to Sweden by the treaty of Olmbruck; for which renunciation the elector paid Sweden a million of rix-dollars. In 1732 the elector obtained the emperor's investiture for Bremen and Verden. The elector of Brunswick, as duke of Bremen, possessiles in the college of princes, the sixth seat on the bench of temporal princes, and in the diet of Lower Saxony, exclusively of a vote, is alternately director with Magdeburg. The affilment of the duchy to a Roman mouth, is 24 hours and 100 foot, or 688 florins, which is also its contingent to the matriona of
of the circle; and to the imperial chamber at Wetzlar, it pays 108 rix-dollars, 22,4 krentzern. The duchies of Bremen and Verden are jointly under the following colleges; viz., the regency, consisting of three counsellors, and subordinate to the privy-council at Hanover; and the chancery, composed of the three counsellors of regency, a director, and certain judiciary counsellors, and taking cognizance of criminal and executive causes. In the high court of justice sit all the members of the chancery, with seven assessors, nominated by the flies of each diocese; viz., three by the Bremen nobility, two by Stade and Buxtehude, one by the nobility of Verden, and one by the town. The chief branches of the sovereign's revenue are those of the demesne bailiwicks, districts, and jurisdictions, with the regalia; certain payments arising from the subjects, as excise, and the monies for the maintenance of the high court of appeal at Zell, for furnishing forage, &c.

In the whole diocese there are but two cities, viz., Bremen and Stade, and 12 market towns. The flies of Bremen confit of the nobility, and the deputies of the towns of Stade and Buxtehude, whose privileges are the same with those of Verden. An assembly of all the flies, or a diet, cannot be held without the knowledge and consent of the regency; but the nobility may assemble twice a-year at Balfal, without giving any previous notice to the regency. All the inhabitants, except those who belong to the free flies, and who have a right to sit and vote in the diets, are taxable; and the number of taxable hearths is 22,756. The established religion is Lutheranism; the number of Lutheran churches is 118, under the superintendency of more than this number of pastors; and the supreme inspection of the churches of this diocese and of the principality of Verden is vested in a general superintendent. The Calvinists form seven congregations, with a like number of pastors. The doctrine and institutions of the reformed church were introduced into the republic of Bremen in the 16th century. An attempt for this purpose was made fo early as the year 1556, by Albert Hardenberg, the intimate friend of Melanchthon; but it did not succeed till towards the close of this century, when no measures, either of prudence or force, were sufficient to prevent the church of Bremen from modelling its faith, worship, and government, after that of Geneva. The manufactures of this country, exclusively of cordage and linen, are those of cloth, flannel, kerseys, and other woollen stuffs, at Scharnbeck. Ammound, in the district of Leffum, has a sugar refinery, and a porcelain manufacture. The principal rivers of the diocese, besides the Elbe and the Weser, are the Otte, the Schwinge, the Lueke or Aua, the Geete, and the Lefum.

Bremen, an imperial city of Germany, and capital of the diocese of the same name. This city lies on the banks of the Weser, which divides it into the Old and New town; joined by a large bridge, and another smaller one over a little branch of the same river. The streets of the Old town are very narrow; the houses, which are rarely more than two stories high, are, in general, old-fashioned and inconvenient, nor are the more modern built with great taste. The exchange, however, the Lutheran orphan-house, and a few other edifices, are in a much better style. The houses, both of the Old and New town, which are numbered, inclusive of the suburbs, are 5105; and Hoesck enumerates the number of inhabitants at 49,000. The Old town is the largest and most populous, and is divided into four parishes. Most of the magistrates and principal merchants have their winter habitations in this town; but their gardens and summer residences are in the Old town. In the Old town stands the cathedral, which is an ancient Gothic structure, and which belongs to the Lutherans. Under its cloister is the "Berecker," or lead-cellar, so called because the lead, with which this building is covered, was cast there. It has the singular property of preserving from putrefaction the dead bodies which are put in it, and which resembles the vaults of the Cordeliers and Jacobins in Toulouse. This city is governed by a council, that consists of four burgomasters, who preside by turns, each for six months, two syndics, and twenty-four senators, some of whom are jurists, and the rest merchants. The whole body is distributed into four courts, each consisting of a burgomaster and six senators. These magistrates elect their new colleagues, without consulting the citizens; but none can be chosen who are not nearly related to any already in office. They may make any arrangement they think fit, with respect to the police; but they cannot enact any new law, nor alter any part of the constitution, nor impose any tax, without assembling the citizens; nevertheless, no resolutions of these latter are of any effect, unless approved by the council. The management of all public money is committed to deputies, appointed by the citizens, who act under the orders of the council, and must lay their accounts before their constituents. Their taxes are moderate: they who pollute property exceeding 3000 dollars, pay a foot or tax on what they are worth, in which each is left to estimate his own pollutions and to ascertain the sum which he thinks he ought to pay. In doing this, the citizens are, in general, so conscientious and public-spirited, that most of them really contribute more than could strictly be demanded from them; but they are well satisfied that the revenues of their little state are wisely and frugally administered; and not wasted in supplying the extravagances of princes, nor in diffusing corruption among the people and their representatives. The police of this city, it is said, is excellent; and not a beggar is to be seen in or near it; the magistrates taking care to furnish the poor with an opportunity of gaining a subsistence by industry. To the Jews, however, they are less tolerant and equitable; for they will not permit any of them to reside in the city, nor even to enter it, except during the fair. The predominant church at Bremen is the reformed, or Calvinist. Of this persuasion are the magistrates; though the Lutherans are not, by any law, excluded from the regency. Formerly they were sometimes chosen into these offices; but since the Calvinists have had undiluted possession of the government, they have taken care to keep out all that are not of their own sect. This city was formerly an arch-bishopric; but fo early as the 13th century, frequent disputes occurred between it and the bishops and chapter. Frederic, the last archbishop of Bremen, was frequently at variance with the city, opposing its appearance at the diet, though formally summoned to it; and in 1639 he conferred the cathedral on the Lutherans, which had been flung up ever since the year 1568. But in 1640, Bremen was summoned to the diet, and allowed a seat and vote on the Rhenish bench in the college of Imperial cities. In 1648, at the peace of Weilphalia, both the city, its dependencies, and vassals were confirmed in their state-freedom, rights, and privileges, ecclesiastical as well as civil; and though disputes afterwards arose, the house of Brunswick and Luneburg, in 1734, voluntarily granted the city that freedom which had been contested, and all disputes were brought to an amicable termination. In 1757, the French got possession of this city; but in the following year hastily abandoned it and were succeeded by a body of Hanoverians. In the diet of the empire it possessed the eighth seat on the Rhenish bench in the college of Imperial cities. Its municipal allotment is 3,105 florins, and its contingent to the chamber at Wetzlar 148 rix-dollars, 674 krentzern. The king of Great Britain, as elector of Brunswick,
wicke, now claims all the authority which the prelate and chapter formerly enjoyed. He appoints the pastor of the cathedral, which belongs to the Lutherans; who, as such, are immediately dependent on the electoral government.

Bremen is supplied with water from the Weser by means of a wheel turned by the stream, which raises it into a reservoir, whence it is conveyed to the several houses by subterranean conduits, at a very small expense. On the building which contains this machine is the following inscription:

"Volve Pater, Civis tradam tua dona, Visurgis!"

Provisions of all kinds are much cheaper at Bremen than at Hamburg, or even in Hanover; and yet neither the commerce nor the wealth of Bremen is inferior, in proportion to its size, to those of the other Hanse towns; but the expensive luxury, which prevails in many trading places is unknown here, and the manners of the inhabitants are plain and frugal; of which one great cause is, that the town is very little visited by strangers. In this city there are many manufactures, exclusive of a very considerable trade. This trade consists in iron, brass, hemp, and linen, exported to England, France, Spain, and Portugal, and in returns of various other articles with which it supplies Welfphala, and the countries about Hanover. It is also a considerable gather by its fisheries, and particularly the trade of blubber with the south of Germany. Bremen is famous for Rheinh wine; the sale of which is monopolized by the city, and it can be bought only at the public vaults. In one of these, as we are informed by baron Knigge in his "Letters written on a Journey from Lorraine to Lower Saxony," published in 1793, that wine is kept so very old, that it, to the prime colt, the accumulating interest of the money, the filling up, and other expenses, were added, a bottle of which would amount to above a thousand dollars; but the banor does not vouch for the truth of this report. This precious liquor is only used by the magistrates on rare and grand occasions, and it is sometimes administered, by order of the president, to the sick.

The character of the inhabitants of Bremen, says this author, has been unjustly treated with contempt by travellers; and they have been represented as a plodding, stupid people, without genius or taste. He observes, on the contrary, that though the citizens of Bremen have not that exquisite taste for the comparatively trifling arts of luxury and amusements, nor that studied polish of manners which results from an habitual want of more serious employment, and from frequent intercourse with foreigners, whole male object is pleasure; they have in general good natural abilities, improved by a judicious education; and with respect to useful knowledge, whether literary or scientific, more information may be obtained by conversation in Bremen, than in many places in which more pompous pretensions are set forth. They are obliging, frank, and hospitable; and their numerous and excellent institutions for the education of orphans, and for other charitable purposes, which are supported by voluntary contributions, reflect honour on their generosity and public spirit. This city has lately afforded M. Oberson an opportunity of forming an association of opulent merchants, who have established a museum, a physical cabinet, and an observatory, with professors, among whom M. Oberson, the discoverer of the new planet called Pallasis, is the professor of astronomy. Bremen is situated 52 miles S.W. of Hamburg. N. lat. 53° 20'. E. long. 9°.

BREMENIUM, in Ancient Geography, a town from which Antoninus begins his first journey in Britain. It was one of the towns belonging to the Otadeni. Dr. Gale places it at Brampton, on the river Bremish in Northumberland; others place it at Brampton in Cumberland; but the altar that has been found at Richelpher, or Richelher, near the head of the river Read in Northumberland, with the name Breminum upon it, demonstrates that this was its real situation. Baxter (Glos. p. 467) derives its name from the British words Bre man it, which signify a town upon a hill near a river, which is agreeable both to its situation and present appellation. Horold, Brit. Rom. p. 243.

BREMESCHLÖSELE, in Geography, a large village and bailiwick of Germany, in the duchy of Bremen, which was formerly the palace of the archbishop. It has municipal privileges and two burgomasters; 30 miles N. of Bremen, and 10 S.W. of Stade. N. lat. 53° 58'. E. long. 8° 35'.

BREMETONACIS, in Ancient Geography, a place of Britain, in Antonine's tenth rout, from Glannoventa to Mediolanum, between Galacum and Coccium, or Appleby and Richelher; supposed to be Overborough.

BREMGARTEN, in Geography, a town of Swiflerland, and one of the free bailiffages, formerly subject to the cantons of Zuric, Bern, and Glarus, from the year 1712, and united by the French division of 798, to Baden, which forms a part of the department of Argovie or Argow, according to the French constitution of 1801. The inhabitants of this bailiffage are Roman catholics. Its regency, previous to the French conquest, consisted of the little and great council; the former being composed of 12 members, and the latter of 40. The town is seated on the Reifs, about 8 miles S. of Baden; and has a wooden bridge over the river, forming a communication between the cantons of Zuric and Bern. It is divided into the Upper and the Lower town; the former situated on an eminence, and the latter on the bank of the river. N. lat. 47° 4'. E. long. 8° 12'.

BREMIS, a town of Swiflerland, in the Valais, situated south of the Rhine and near it; 4 miles E.S.E. of Sion. N. lat. 45° 16'. E. long. 7° 16'.

BREMONT LA MOTTE, a town of France, in the department of Pay-d-Dôme, 10 miles from Clermont.

BREMPT, a small town of Germany, in the electorate of Treves, seated on the Mofelle.

BRENES, a range of mountains in the southern part of Africa, towards the Cape of Good Hope, which, according to Barrow, in his "Travels," 1701, p. 308, falls N. W. and S. E. about lat. 33° or 34°. This great range, says Pateron, p. 125, runs E. and W. at the distance of about 4 days' journey from the mouth of the Orange river; probably the immol terrace of the Table land of southern Africa, which seems to be pervaded by the Jagas, a wandering nation like the Tartars.

BRENSCHHUSEN, a town of Germany, in the circle of Welfphala, belonging to the abbey of Corvey, 4 miles N. W. of Corvey.

BRENDOLO, a small sea-port town in the canals of Venice, between Venice and the mouth of the Po.

BRENNET, a picturesque lake of Swiflerland, in the valley of the lake of Joux, upon that part of the Jura chain of mountains called Mont Joux, in the bailiffage of Roman Motier. From this small lake defends a stream, which is led in a hollow gulph called "L'Entonnoir," or the funnel, in which several mills are turned by the force of the current. About 2 miles further, on the other side of the mountain, the river Orbe bursts forth, and is probably produced by the streams of ingulphed.

BRENETS, I.e., a village and mayorality of Swiflerland, in the Valais, containing about 1000 inhabitants; 10 miles N.W. of Neuchatel. It is seated near the river Don. N. lat. 47° 5'. E. long. 6° 27'.

BRENN,
BRENNAGA, Brennagia, in Middle Age Writers, a kind of tribute paid, in lieu of bran, or bran itself, which the tenants were obliged to furnish for support of the lord’s bounds. The word is also written Brenage, brengium, and brengus, breningium, brennaticum. Du. -Cange. Lat. Coiff.

BRENNAU, in Geography, a town of Lower Bavaria, situated on the river Illm, nearly built and sinking into decay; 32 miles from Munich, and 23 miles from Passau.

BREN, the name, before the revolution, of a small district of France, that lies between Berri,Touraine, and Poitou, and of which the chief town was Messieres; forming now a part of the department of the Indre.

Brenne, a town of France. See Braine.

BRENNER, Henry, in Biography, a learned Swede, born in 1665, in the parish of Kronoby in West Bothnia.

Having finished his education at Upsal, he accompanied, in 1697, Lewis Fabricius, his Swedish majesty’s ambassador, to Peria; and as he had acquired, in this journey, an extensive knowledge of the eastern languages, he remained in that country for the purpose of allaying the Perians envy, Sans Chan Beg, in his mission to Sweden. On their way through Russia in 1700, a war having taken place between Charles XII. and Peter I. Brenner was arrested at Mofcow, under a suspicion of some political intrigue, and confined in prison till the peace of Nyild. This journey, however, produced a learned epistolary correspondence with Elias Brenner, Griphenhelm, Gavelus, Benzhezer, and Liliendelk, part of which has been published; and the history of Moses Armas Arsmn Choronensis, under the title of “Epitome Commentationum Mofys Armeni de origine et regibus Armemorum et Parthorum, cum notis et observationibus.” Stockholm, 1723. The Armenian original of this work, written about the middle of the 17th century, in the Armenian language, was printed at Amsterdam in 1693; and another translation of it was printed at London in 1736 by the sons of the celebrated Whilton. In 1722 Brenner communicated to the royal college of the chancellors his observations on the cause of the expedition undertaken by Peter I. against the Persians; of which Julius Rabner has availed himself in his history of that prince. In the course of these observations, he announced his intention of giving an accurate description of the Caspian sea, and of the river Daxia in the country of the Nezette Tartars, which he supposed to be the ancient Jaxartes; but a copy of it was interdicted, without acknowledgment, in the “Mcmorabilia Orientalis partis Asiæ.” Whilf Brenner occupied the office of librarian to the royal library at Stockholm, to which he was appointed in 1722, he enriched it with more than 30 volumes of MSS. which treat of the ecclesiastical history of Sweden. But his health having been impaired by his long confinement in Russia, he died in 1732. Gen. Biog.

Brenner, in Geography, the modern denomination of the Rhetian Alps, which pass through the Tyrol, between Innsbruck and Storzings, over which the high road is extended through an interval of 4 leagues. These mountains rival the grand Alps of Switzerland in numerous glaciers, and, like other grand chains, present exterior barriers; that on the north being distinguished by the name of Spitz, and that on the south by the appellation of Vedretta. The primitive or greatest elevations are on the north of Storzings, whence a river proceeds towards the river Inn on the north, and to the Adige on the south; and the Eifac descends, as a precipitous torrent, amidst masses of granite, porphyry, and marble, while the avalanches become dangerous to travellers. The naked and rugged peaks of the mountains Lorenzen, Turteln, and Tschatafisch, raise their towering heads towards the N. and on the N. are those of Glandier, Schlaff, Pragels, and Pullfjuran. Their summits are entirely bare, and seem to be composed of granite. The glacier most easly of access is that of Stuben, the centre of which presents many Alpine plants; and the granite and porphyry are frequently covered with calcareous floes. The glacier of Stuben is 46 feet above the level of the sea, and exhibits the usual phenomena of such scenes, with beautiful pyramids of azure, which in sunshine reflect a blaze of light. The mountain, particularly called Brenner, is, according to Beaumont (ubi infra) only 5120 feet above the level of the sea. The town of Steinach is placed nearly in the centre of the Tyrolean chain; towards the east, from the midst of a long course of glaciers running N. and S. of the mountain Gfornson, a mass of granite covered with snow, and one of the highest peaks of the Rhetic Alps; on the west is Habichpitz, of smaller height; but to the S. W. is Tribaten, another stupendous peak of the great Brenner chain. Beck-kogo (which see) is another. The Brenner, or burning hill, says Beaumont, is so called on account of the frequent thunder-flames. Beaumont’s Rhetic Alps, Lond. 1792. Pinkerton’s Geog. vol. i. p. 362. See Alps, and Tyrol.

BRENNING. See Burning.

BRENNIKIRCHEN, in Geography, a small town of Lower Austria, on the frontiers of Hungary, not far from the Danube.

BRENO, a town of Italy, in the Brescian, seated near the Oglio, between Bormio and Brescia; 32 miles N. of Brescia.

BRENOD, a town of France, in the department of the Ain, and chief place of a canton, in the district of Nantus; 5 miles S. of Nantus. The town contains 879, and the canton 6959 inhabitants; the territory includes 215 kilomètres and 11 communes.

BRENSCHEN, or Breunschen, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz; 7 miles S. of Mühlberg.

BRENT, Miss, in Biography, afterwards Mrs. Pinto, the first finger who performed the part of Mandane in Dr. Arne’s Artaxerxes. In her bravura singing she had considerable merit: her execution was neat, distinct, rapid, and univalved at the time (1763); but has been greatly surpassed by subsequent female singers. This performer died in 1802, oppressed by age and indigence. Her history, if detailed, might furnish a useful lesson to female favourites of the public, poetified of greater vocal powers than human prudence.

Brent, in Geography, a river of England, which runs into the Thames at Brentford in Middlesex.

BRENTA, a river which has its source in the Tyrol, about 7 miles E. from Trent, passes by Padua, and runs into the Adriatic, a little to the south of Venice.

BRENTA, in Ornithology. See Branta.

BRENTFORD, in Geography, a market-town of Middlesex, England, stands on the northern banks of the river Thames, at the distance of seven miles W. from London. This place is particularly distinguished in the page of history as the scene of warm contention, in the strongly contested elec-
the death of Luther, he assumed a considerable lead in his party. He was twice married; and in 1550 died at Tubingen, where he was theological professor, leaving behind him a numerous progeny. His works have been published in 8 volumes, fol. Moreri.

BRENTOLA, or BRENDOLIA, in Geography, a small town and district of Italy, in the Vicentia, at a small distance from Vicenza.

BRENTON's ref', the southernmost point of Rhode island, in America, about three miles from Newport, lies 2 miles E. of Beaver-tail; forming with it the mouth of Newport harbour.

BRENTONEGO, a town of Germany, in the Tyrol; 12 miles S.S.W. of Trent.

BRENTUS, in Entomology, a genus of Coleopterous insects, having the head projecting into a very long, straight, cylindrical snout, beyond the middle of which the antennæ, which are moniliform, are inserted. Fabr. &c. The species of this genus are anchorage, affinis, bartoria, litorum, cylindrinotus, dispara, dunyanus, hydile, monilis, nanae, and semipunctatus, which see.

BRENTWOOD, in Geography, is a large chapelry in the parish of South-Weld, in the county of Essex, England, situated 18 miles E. from London, on a commanding eminence. It is a considerable thoroughfare, and contains many inns and public-houses. The Crown Inn is of very ancient foundation; and even in Salmon's time was reputed to have had that sign for 300 years. The county affords were once held here; and in the High-street are the remains of a town-hall and prison, inhabited by a factor and other persons, who are bound to put them in repair when the affixes shall be again removed thither. Here is a good grammar-school, endowed by Sir Anthony Brown in 1537. The chapel of the small ancient structure, was founded about the year 1221, at the intercession of David, prior of St. Osyth, for the use of the tenants of a manor belonging to that monastery. This township contains 182 houses, and 1007 inhabitants. Camden supposed the Castaromagus of the Itinerary to have been in the neighbourhood of Brentwood. At South-Weld is a circular camp, single-ditched, including about seven acres, supposed to have been a cætra exploratory near which the Roman way, called Watling-street, passes. Morant's History of Essex, 2 vols. fol.

BRENTWOOD, a township of America, in Rockingham county and state of New Hampshire, containing 971 inhabitants, distant 7 miles from Exeter, and 19 from Portsmouth. In its vicinity is found a stone in which vitriol and sulphur are combined.

BRENTZ, a river of Germany, which rises in Wirttenberg, and discharges itself into the Danube, near Lauingen.

BREPHOTROPHIUM, from φωτοσ, infant, and τρόπος, I nourish, an hospital for foundlings, or a place wherein children, exposed by their parents, are brought up at the public charge.

BREWERWOOD, Edward, in Biography, first professor of altronomy at Gresham college in London, to which office he was chosen in 1596, was born in the city of Chester in 1565; and having completed his course of grammar learning in his native place, was admitted, in 1581, of Bravenose college, in the university of Oxford. Here he acquired the character of an affluence student, and took his degree of master of arts in 1590. Failing in his attempt to obtain a fellowship, for which he was a candidate, he removed to St. Mary's hall. After his election to the professorship of Gresham college, he seems to have had no wishes of further preferment; but devoted himself to the pursuit...
pursuit of knowledge, and passed the remainder of his life in retirement. He died of a fever, Nov. 4th 1613; and was buried in the chancel of St. Helen's church, without any monument or other memorial. From his works on a variety of subjects, which were printed after his death, we may conclude that he was a very general scholar. Thence are as follows: 1. "De ponderibus et pretiosis veterum numorum, erorumque curn recentioribus eoodum," lib. i. Lond. 1614, 4to. printed also in the "Critici Sacri," vol. viii. and in the Apparatus of the "Biblia Polyglotta." 2. "Enquiries touching the diversity of Languages and Religions through the chief parts of the World," Lond. 1614, 2, 3, 25, 40.; 1647, &c. 8vo. To this was prefixed a learned preface by his nephew and heir, Robert Brewood. 3. "Elementa logicae, in gratiam studentum juvatissimam in academia Ooniienii," Lond. 1614, 1615, &c. 8vo. 4. "Tractatus quidam logici de predicabilibus, et predicamentis," Oxon. 1640. 4to. 1628; and 1637, &c. 8vo. 5. "Tractatus duo; quorum primus est de meteoris, fecundus de occultis," Oxon. 1631, 1638, 8vo. 6. "A Treatise of the Sabbath," 1611; Oxon. 1631, 4to. 7. "Mr. Byfield's Answer, with Mr. Brewood's Reply," Oxon. 1631, 4to. 8. "A second Treatise of the Sabbath," or "An Explanation of the fourth Commandment," Oxon. 1632, 4to. 9. "Commentarii in Hisbe Arbitotelii," Oxon. 1640, 4to. 10. "A Declaration of the Patriarchal Government of the Ancient Church," Oxon. 1641, 4to.; Lond. 1647; Bremen, 1701, 8vo. Ward's Lives of the Professors of Greinham College, p. 74, &c.

BRESANY, or BREZAN, in Geography. See Breszany.

BRESA, a small town of Sardinia, in the north part of the island, in the proximity of Bologna; the capital of which is called "Capo di Lugatori." BRESIA, or BRESCIA, or BRESCIANO, a country of Italy, formerly a part of Lombardy, but now belonging to the Cisalpine republic, is bounded on the north by the county of Bormio, on the north-east by the Trentin, on the east by the Veronese, from which it is separated by the lake Garda, on the south by the Mantuan and Cremonese, and the small lake of Idro, and on the west by the Bergamasco, from which it is in a great part divided by the lake Iseo. Brescia, though mountainous, is fertile in wine, oil, and maize, and has excellent pasturages, and some mines of copper and iron, and also manufactures of silk, paper, &c. The air is wholesome, and the country populous. Its principal rivers are the Adige and the Oglio. It became a province of the Venetian state in 1517; but Brescia, its capital, was taken by the French under Bonaparte, in 1796, and it formed a part of the Cisalpine republic by the 8th article of the treaty of Campo Formio in 1797, confirmed by the 12th article of the treaty of Luneville in 1801.

Brescia, in Latin Brixia, the capital of the above province, is situated on a beautiful plain on the small river Garza. It is large, being reckoned about a league in circumference, well fortified, having a castle on a hill, and is said to contain about 50,000 inhabitants, of whom are rich and noble, and others are ingenious and diligent in carrying on several manufactories of linen, and particularly fire-arms, swords, knives, and other cutlery wares. It is enclosed with walls, in which are five gates; the streets are handlome and clean, most of them being watered by little streams from the river, and the buildings are good. It has several public squares, the largest of which is surrounded with piazzas, and in the centre of which is the town-hall. The palace, where public business is transacted, is a magnificent stone structure, built from the ruins of a temple of Vulcan, and remarkable for its architecture and paintings in fresco. Besides the cathedral, this city has 19 parish-churches, 30 convents, a general hospital, and several charitable foundations. The cathedral is a modern edifice, to the rear of which cardinal Quirini, once bishop of this city, contributed liberally; and he also presented the city with a library; in acknowledgment of which the magnificence, in 1759, erected two marble statues to his honour, one in the church, and the other at the entrance of the library. In the cathedral is exhibited the famous standard of Contantine; and this, as well as several of the churches, are adorned with beautiful statues and paintings. The magnificence, before the revolution, consisted of 600 citizens, divided into inferior councils, under a noble Venetian, who prefixed as governor, or podestat. This city was the see of a bishop, suffragan of Milan. Brescia is said to have been built by the Cenomani, commanded by Belovejus; and as others affirm, by Brennus; and it afterwards became a Roman colony. It was burnt by Radagasius, king of the Goths, in 412, and re-established by Attila in 452. It was afterwards peopled by the Lombards. Charlemagne, having defeated king Didier in 771, entered Brescia, and built the church of St. Denis. In 1426, after having suffered much by the troubles occasioned by the duke of Milan, it surrendered itself to the republic of Venice. Gallon de Foix, general of Lewis XI. took it in 1512 from the Venetians, and abandoned it to pillage, with the exception of the house inhabited by Chevalier Bayard; but in 1517, it was restored to the Venetians. It was visited by a plague in 1578, which swept away 25,000 persons, and again by a similar calamity in 1534. Brescia was the birth-place of Tartaglia, the famous mathematician, and of Gambara, the poet, who died in 1596. It is distant about 44 miles E. of Milan, and 32 N. W. of Mantua. N. lat. 45° 31'. E. long. 10° 5'.

BRESICATI, in Commerce, a kind of bays, which supplies the negroes between the river Gambia and Sierra Leone. The chief ports for this trade are the blue and red. BRESIO, in Geography, a small island of France, with a fort upon it, in the gulf of Lyons, near the coast of Languedoc, or Herault, about a league S. of Agde; which see. BRESILLO. See Bresilc.

BRESINI, a small town of Poland, in the latitudinal of Lenceszcz.

BRESINS, or Bresons, a small island of the Atlantic, near the south-west coast of England.

BRESK, or BRESCAN, a town of Africa, in the kingdom of Algeris, seated on the sea coast, at the bottom of a bay in the Mediterranean; 50 miles W. S. W. of Algeris. N. lat. 30° 50'; E. long. 2° 36'.

BRESKENS, a town of Flanders, in the island of Cadzand; 16 miles N. of Sluis.

BRESLAU, or WROCLAW, a principal city of Silesia, bounded on the N. and N.E. by that of Oels, on the S.E. by that of Breslau, on the N. and E. by the Oder, and on the S. by the Breslau. This district forms a kind of large square, about 25 miles in length, by 16 in breadth. The country is very level; and the parts of it nearest the rivers, are either sandy or swampy. It is, however, an excellent corn country, and not deluged of rich pasturage ground; it abounds with sheep and cattle; and near the capital, the coves are of an uncommon size, and yield a proportionate quantity of milk; and this part of the country produces great quantities of madder. Wood is everywhere scarce, except in the circle of Namslau; and the roads are so bad, as to be in some places impassable; but this inconvenience is remedied, particularly in the vicinity of Breslau, by dykes and canals, which are kept in repair at a great annual expense.

On the partitions of Silesia in 1824, among the sons of Ultras, the sons of Breslau fell to the share of Bolehout Altus;
BRE

BRE

but disputes occurring among his successors, it was sold by
one of them, viz. Henry VI., to John, king of Bohemia,
who, after the death of Henry, in 1355, incorporated it
with the crown of Bohemia, endowing the city, at the same
time, with divers important privileges; and the kings of
Bohemia always appointed governors over that principality.
In 1357, king John assigned the government to the city of
Breslau; and, in 1505, king Whidduuf transferred the ju-
dicature of the whole principality to the same city: so that
the chief magistrate occupied the part of governor until the
year 1637, when both the government and judicatures were
surrendered to the emperor Ferdinand III., and in this
state it continued, till it was united to Prussia. It is di-
vided into four circles; viz. those of Breslau, Neumarkt,
Cauth, and Namdlau; and, together with the district of
Glogau, it includes 55 cities, 108 towns, 14 market-towns,
and between 5 and 6 thousand villages, 2000 catholic
churches, 607 protestant churches, 20 abbeys, 91 convents,
and 39,000 hearths in the cities. The principal river of
this principality, of which the property and jurisdicition
belong to the king, is the Oder, which, in its course
through the country, receives the inferior streams of Ohlau,
Lohe, Weyda, and Weiltitz.

Breslaw, or Breslaw, the capital of the above-de-
scribed principality, and of the whole duchy of Silicia, is
situated on the south side of the Oder, which receives the
Ohlau after its winding course through Old Breslau. This
place, the antiquity of which is uncertain, was set on fire by
the Tartars in 1241, and was formerly environs by the
Ohlau, as with a moat; and all without the Ohlau to the
walls in their present position, were additions made by the
emperor Charles IV. The Neukast is more modern, and,
since the year 1529, has been included within the fortifica-
tions, which are now, indeed, of no great importance.
The whole town, both old and new, including the suburbs,
is of great extent, being no less than two German miles in
length. It is reckoned one of the most beautiful cities in
Germany; and has several large regular squares, broad
streets, and flatly edifices, both public and private. The
Roman cathedrals have several churches and convents; the Luthe-
rans have seven churches within the walls, and two without,
and two gymnasium; the Calvinists and the Greeks have,
each of them, one church; and the Jews have two synagogues.
The popish university is a noble edifice; and the exchange,
adjoining to the council-house, is an elegant structure.
Sveral of its monasteries and convents are magnificent build-
ings; and it has some good public libraries, with two armour-
cies, a college of physicians, and a mint. Brellau holds the
third rank, next to Berlin and Konigberg, among the cities of
Prussia. It is the centre of all the trade of Silicia, and its
manufactures are considerable and various. The number
of its inhabitants is estimated at about 52,000: and as it
has several annual fairs, it is much frequented by Hun-
garian, Bohemian, Pulihi, and other merchants. The mag-
ificacy, which is Lutheran, consists of a town-court and a
council; and its consistory is likewise Lutheran. This city
was taken by the king of Prussia in 1741; compelled to sur-
render to the Austrian in 1757; and retaken by the Prus-
sian army at the close of the same year, after a signal victory
over the Austrians in its vicinity. In the last siege, several
of its churches were much damaged, the library of St.
Mary Magdalen was destroyed by the burning of a bomb,
and its suburbs were considerably injured. N. lat. 51° 3'.
E. long. 17° 8' 45'.

Breslau, a town of France, in the department of the
Ois, and district of Beauvais; 7 miles S. E. of Beauvais.
—Als, a river of France, which rises near Aumale, and
separates the department of the Somme, from that of the
Eure, till it falls into the sea at Treport.

Bresma, in Ichthyology, a name given by Hildegard,
and several others, to the Bream, Cyprinus Brana,
which see.

Bresmal, John Francis, in Biography, a phy-
ician at Liege, was born in the year 1660. After studying
some years at home, he went to Paris, where he was ad-
mitted doctor in medicine, in 1689. In the course of his
travels, he had turned his attention, in a particular manner,
to investigating the properties of the most celebrated miner-
al springs, of which, on his return to Liege, he published
analyses, giving also accounts of their virtues in the cure of
diseases. "The titles of his works are, "La circulation des
eaux, ou Hydrographie des mineraux d'Aix, et de Sprs."
Liege, 1695, 12mo. "Description, feu analy"se de fontis,
S. Agidis, prope Tunyros," 1700, 12mo. He cites a de-
cription of this spring from Pliny, "Paralde des eaux
minerales chaudes et froides du diocese de Liege. Avec un
avis au public, pour le prefervr de la tele, &c." 1721,
8vo. For the titles of other works by this writer, on the
fulcit of mineral waters, see Eloy, Diet. Hill.

BreSsian, in Geography. See Brescia.

BreSsai, or Bressa, one of the Shetland islands of
Scotland, about 4 miles long, and 2 broad, separated from
the main land of Shetland by a narrow sea, called "Breslay
found," forming a spacious harbour, in which a thousand
ships may ride at the same time. In this harbour, the
Dutch vessels, employed in the herring fishery, assemble
about the middle of June. The inhabitants of Breissay fit
out about 26 large fishing boats. The mountains supply
flute for building, and peat for firing. N. lat. 60° 20'. W.
long. 0° 56'.

Bress, a country of France, so denominated before
the revolution, from a forest called "Brexia," situate in
the province of Burgundy, and bounded on the east by Sau-
voy, on the south by Viennois, on the west by Lyonnais
and Dombes, and on the north by Franche Comté. It is
estimated at 40 miles from north to south, and 23 from east
to west. It is fertile in corn and hemp, and has fine pa-
tures and several lakes, abounding with fish. For some
time, it was an eardom subjuct to the dukes of Savoy, who
retained it in 1601 to France, in lieu of the marquisate of Sa-
luzio. The principal towns are Bourg, the capital, Beauce
or Bauge, Coligny, Montreuil, Loge, and Pont de Vaux.

BreSscil, or Breste. See Bresc.

BreSsoles, see Bresoles.

BreSsuire, a town of France, in the department of
the Sevres, and chief place of a canton, in the district of
Thouars. The town contains 630, and the canton, 5911
inhabitants: the territory includes 290 kilometres, and 13
communes.

BreSsus, or Brepus, in Ancient Geography, a town
of Aia in Armenia Major, situate near the Ephrataes,
according to Ptolem.

BreS, or Breast, in Architecture, a term used by
some, for that member of a column otherwise called the
Tare.

BreS-Summers, or Bressumers, in Building, are
pieces of timber designed for the support of the brick-work
in the front or rear wall of a building, for carrying arches,
and. In the inner parts of a building, the pieces into which
the girders are framed are called summers.

BreSt, in Geography, a seaport town of France, and
principal place of a district, in the department of Finiterre.
The number of inhabitants in the 3 parts, into which it is di-
vided, is estimated at 27,000; the first canton contains
13,000, and includes 52 kilometres, and one commune;
the second contains 17,275 inhabitants, and comprehends 24 1/2 kilometres, and 5 communes; and the third canton includes 14,406 inhabitants, 223 kilometres, and one commune. Breast is feated on the declivity of a hill on the side of its port; and its streets, which are few in number, are narrow and inconveniently contrived. It has two parish churches, a marine seminary, and a court of admiralty; but it is principally famous for its spacious road and harbour, which are reckoned, (if we except Toulon), the largest and the safest in the whole kingdom, and capable of containing 300 ships of war, in 8, 10, and 15 fathions, at low water. Its entrance from the west south-west, called the "Gullet," is narrow and rocky, and the passage is difficult and dangerous, on account of the funken rocks on both sides of the flore. The entrance is also guarded by a strong castle seated on a rock on the sea-side, and defended on the land-side by a large ditch and other fortifications. On one side of the port is a large quay, more than a mile long, and 200 paces broad, covered with flore houfes for various kinds of mercantile; and, on the other side, there is also a quay, for the warehouses, and the fine church of Notre Dame; and in a suburb, about half the size of the city, there is a strong tower opposite to the castle at the entrance of the harbour. At the bottom of the harbour, to which the range of magazines on the quay nearly extend, there are two docks for the building of ships, adjoining to which are the slips and houfes of the workmen; and one of these docks separates the rope walks from the city. The arsenal of Breast is a very large and magnificent building, plentifully supplied with different kinds of naval flores. This was entirely consumed by fire in the year 1744. In 1604, an attempt was made by lord Berkeley, who commanded a fleet of twenty-nine ships of war, with a number of fire ships and bomb-ketches, and general Tallmahe, who had the command of twelve regiments of infantry, and two of marines, to feize on Breast. But whilft the failing of this expedition was delayed by counter-intrigues, the king of France dispatched marechal Vauban to repair the old, and to raise new fortifications, and a large body of troops to defend them. When the English armament arrived, the French were prepared in great force to repel it; and, therefore, the attempt, though conducted with singular resolution, was defeated, with the loss of 900 British soldiers, and 400 seamen, and of general Tallmahe, who died of his wounds, and who, in the agonies of death, complained, that he had fallen by the treachery of his countrymen. N. lat. 48° 22' 55''. W. long. 4° 32' 50''.

Breast, bay of, an American bay on the coast of the Western ocean in New Britain. N. lat. 52° 10'. W. long. 5° 20'.

Breast, Cape, lies in the Pacific ocean, on the east coast of the north island of New Zealand, within about 7 leagues of several small islands, close under the main, called "Ca-valles". S. lat. 35° 7'. E. long. 173° 52'.

Breath, in Ichthyology, a name which the people on the coast of Lincolnshire give to the common turbot, a fish extremely common with them, and taken in vast abundance. The way of catching them is in a net, trailed it is fayed upon the ground by two horses; the one going up to the middle of his body in the water, the other on the flore. The turbot is known by the name of Brett among the fisher men, on many of our sea coasts, but most commonly, the smaller turbot only are distinguished by that title; when they have attained to a moderate size for the table, they are called turbot. It should be further observed, that the pearl, Pleu renicnts Rhambus, likewise obtains the name of Brett in some parts of the country. Brett is the name of the turbot almost throughout the north of Britain.

BRETHREN, in Middle Age Writers, denote wooden towers or cables, wherewith towns or camps were defended. Du Cange Gloss. Lat.

BRETAGNE, in Geography. See BRITANY.

BRETCHEN, or BRETAIN, a small town of Polish Prussia with a cable on the same river, in the territory of Culm; 47 miles E. of Culm.

BRETENOUX, a town of France, in the department of the Lot, and chief place of a canton in the district of Vigene; 4 miles N. N.W. of St. Cerc. The place contains 395, and the canton 8.774 inhabitants; the territory comprehends 149 kilometres, and 15 communes.

BRETTESSED, in Heraldry, a term used by French heralds to express any charge that is embattled on both sides opposite to each other.

BRETEUIL, in Geography, a town of France, in the department of the Eure, and chief place of a canton, in the district of Evreux, 5 leagues S. S. W. of Evreux. The place contains 183, and the canton 12,775 inhabitants; the territory includes 187 1/2 kilometres, and 14 communes.

Bretueuil, is also a town of France, in the department of the Oise, and chief place of a canton, in the district of Charnon, 34 polls S. of Amiens. The place contains 2160, and the canton, 14,232 inhabitants; the extent of the territory comprehends 147 1/2 kilometres, and 19 communes.

BRETHREN and SISTERS of the Free Spirit, in Ecclesiastical History, an appellation assumed by a new sect which sprung up towards the close of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomination from the words of St. Paul, Rom. chap. viii. ver. 2, 14, and maintained, that the true children of God were invested with the privilege of a full and perfect freedom from the jurisdiction of the law. They were enthusiasts to a degree of distraction, both in their principles and practice. They resembled the BEGARDS, by which name they were sometimes called, in their aspect, apparel, and manner of living. Some of their protest principles resembled those of the PANTHEISTS; for they held, that all things flowed by emanation from God; that rational souls were portions of the Deity; and that the universe was God; and that by the power of contemplation, they were united to the Deity, and acquired thereby a glorious and sublime liberty, both from the sinful lusts and the common instincts of nature: and hence they concluded, that the person who was thus absorbed in the abyss of the Deity, became a part of the Godhead, and was the son of God in the same sense and manner that Christ was, and that he was freed from the obligation of all laws, human and divine. They treated with contempt all Christian ordinances, and all external acts of religion, as unsuitable to the state of perfection at which they were arrived. Some of them were honest but deluded enthusiasts; and they endured the torments inflicted upon them by the inquisitors with astonishing calmness and triumph. Others proceeded to the most extravagant licentiousness of conduct. They held their secret assemblies flark naked, and lay in the same beds with their spiritual fathers, and indiscriminately with other women, without the least scruple or hesitation; modesty and decency being, according to their creed, marks of inward corruption. And some of them proceeded still further, and maintained, that the DIVINE MAN, or believer, could not sin, let his conduct be ever so horrible or atrocious. Many edicts were published against them; but notwithstanding the severity they suffered, they continued till about the middle of the fifteenth century. They were called by several other names, such as Schweffelhuts, Picards, Adamites, and Turlupins. Moultin's Ecc. Hist. vol. iii. p. 122, &c. 202, &c. 273, &c.
Brethren and Clerks of the Common Life, a denomination assumed by a religious fraternity towards the latter end of the sixteenth century. They lived under the rule of St. Augustin, and were evidently useful in promoting the cause of religion and learning. Their society was first formed, in the preceding century, by Gerard de Groot, a native of Deventer; but did not flourish till about the period above-mentioned, when it obtained the approbation of the council of Conclave, and became very respectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two classes: the Lettered Brethren, or clerks, and the Infradit, they lived in separate habitations, but maintained the closest fraternal union. The former applied to the study of polite literature, and the education of youth; whilst the latter were employed in manual labour, and the mechanic arts. Untrained by religious vows, they nevertheless had all things in common; and this community was the great foundation of their union. From the schools erected by the clerks proceeded many celebrated personages, who contributed to the revival of literature and taste in Germany and Holland; such as Ensennus, Hegius, Mermelius, &c. They were frequently called Echardens, and Rallards, by way of reproach. Moellers, vol. iii. p. 252.

Brethren, White, Fratres Alciati, were the followers of a leader about the beginning of the sixteenth century, who was arrayed in a white garment; and, as they were also clothed in white linen, they were distinguished by this title. Their leader was a priest from the Alps, who carried about a crose, like a standard, and whose apparent sanctity and devotion drew together a number of followers. This induced enthusiasm propagated many acts of mortification and penance, endeavouring to persuade the European nations to renew the holy war; and pretended that he was favoured with divine visions. Boniface IX, apprehending that this enthusiasm or impostor concealed infamous and ambitious views, ordered him to be apprehended and committed to the flames, upon which his followers dispersed. Moellers, vol. iii. p. 255.

Brethren of the Obscurans. See Obscurans.

Breton, in Geography, a river of England, which runs into the Stremer, near Hadleigh in Suffolk.

Breton, a sand-bank, about two miles from the coast of France, in the English channel, and at the same distance south from Granville, towards Capel Bay, the middle of which is dry at low water.

Breton, Cape, lies at the north end of the lake which extends northward from the Bayonne river at the bottom of the bay of Biscay. It is known at Bayonne by its flat tower, and often called "Carbron."

Breton, Cape, an island, or rather a collection of islands, called by the French, "Les Isles de Madame," situated in the Atlantic ocean, on the coast of North America, between 45° 28' and 47° N. lat. and between 66° 4' and 67° 30' W. long. and about 45 leagues E. of Halifax. This island is about 160 miles in length, and from 29 to 34 in breadth; and, though attached to Lower Canada, is separated from Nova Scotia by a narrow strait, called the "Gut of Caplis," which forms the communication between the Atlantic ocean and the gulf of St. Lawrence. It is surrounded with sharp pointed rocks, separated from one another by the waves, above which some of their tops are visible. All its harbours are open to the eait, turning towards the south; and on the other parts of the coast there are not a few anchoring places for small vessels, in creeks or between illets. The soil is generally swampy and moity, and unfit for agriculture; and as it abounds with lakes and forests, the climate is cold and foggy. The scarcity and poverty of pastures have likewise prevented the increase of cattle. Although it abounds in timber, such as pine, beech, birch, maple, spruce, and fir, it has derived little advantage from it. The fur-trade of this island has always been very inconsiderable; its peltry consisted only in the skins of a few lynxes, elk, musk-rats, wild-cats, bears, otters, and foxes, both of a red and silver and grey colour. Some of these were procured from a colony of Micmac Indians, who had settled on the island with the French, and never could raise more than 60 men able to bear arms. The rest came from St. John's on the neighbouring continent. The fisheries is a much more important object; and, in 1743, when this island belonged to the French, the whole value of it is said to have amounted annually to a million sterling; and no less than 534 ships, besides small boats, and 27,000 seamen, were employed in this trade. At present the inhabitants of the island take about 30,000 quintals of fish annually, which are shipped for Spain and the Frits, principally by merchants from Jersey (belonging to England) who yearly reftor hith and keep stores of supplies for the fishermen. Part of their fish was sent to the French southern islands, in 20 or 25 ships from 70 to 140 tons burden. Besides the cod, which made at least half their cargo, they also exported to the other colonies, timber, planks, thin oak-boards, salted salmon and mackerel, turin, and sea-coal. In return they received sugar and coffee, rum and molasses; the overplus of which they conveyed to Canada and to New England, where they obtained in exchange, fruits, vegetables, wood, brick, and cattle. Besides this allowed trade, they also carried on a clandestine or smuggling commerce, in flour and salt-fish. In this island there is a very extensive bed of coal, which lies in a horizontal direction, about six or eight feet below the surface; but this has been chiefly used as ballast. In one of the pits a fire has been accidentally kindled, which could not yet be extinguished. These mines yield a revenue of 12,000l. yearly to the crown. The number of inhabitants in Cape Breton does not exceed 1000.

This island was discovered, according to the French authors, about the year 1500, by the Normans and Bretons, who navigated these seas; and as it was supposed to be a part of the continent, it was called Cape Breton, which appellation it has absurdly retained. But though it had been for some time a place of resort for fishermen in the summer, the French did not take possession of it before the year 1713; they then changed its name into that of "Ile Royale," and fixed upon fort St. Dauphin as their chief settlement. But as this harbour, though spacious and sheltered from winds, was difficult of access, they directed their views to another situation; and in 1720 commenced their fortifications at Louisbourg. The settlers were chiefly Europeans; the Acadians and French of Nova Scotia not choosing to leave that country. This island remained in the possession of the French till the year 1745; when it was captured by the New-England militia under the command of William Pepperell esq., colonel of the militia, and a squadron under commodore Warren. It was afterwards referred to the French, and retaken in 1758, by admiral Boscawen and general Amherst; and finally ceded to Great Britain by the peace of 1763; since which period the fortifications have been blown up, and the town of Louisbourg dismantled. This island, with respect to matters of government, was considered as annexed to Nova Scotia, till the year 1784, when it was erected into a separate government by the name of Sydney, its capital. The other principal town is Louisbourg. The present seat of government is at Spanish river, on the north side of the island. This island may be regarded as the key to Canada, and the fishery in its neighbourhood depends on its protection; and the most convenient harbour for its security and supply is Louisbourg.
BRETON, Pertuis, or Breton channel, lies on the west coast of France, and on the north of the island of Rhé, between that island and the main.

BRETON, Port, lies at the extreme part of the Mediterranean, on the coast of Syria in Asia; N. N. E. from Larissa gulf, at a distance of about 14 or 15 leagues.

BRETONNAYAN, René, in Biography, practiced medicine with reputation at Turin, towards the end of the 16th century, but is only now known by a singular work in verse: "La Generation de l'homme, et le temple de l'ame, avec autres œuvres poetiques extraites de l'Encyclopaie, de R.B." Paris, 1583, 4to. In the course of the poem the author treats of the fome, gout, melancholy, colic, &c. The heart he calls the sun of the microcosm; the liver the temple of human nature. He describes also a variety of cosmetics to beautify the skin, which was at that time very much the custom, among writers on medicines, particularly those who treated on the diseases incident to women. Haller. Bib. Ch. Eloy. Dict. Hist.

BRETOYSE, or Bretois, the law of the marches of Wales; in use among the ancient Britons.

BRETTA, or Brethene, in Geography, a town of Sweden, in the province of Dalecarlia, at the western extremity of the lake Vener or Wener, and at the distance of about half a Swedish mile from Wenerborg.

BRETTEN, or Bretehine, a town of Germany, in a prefecture of the same name, in the circle of the Lower Rhine, and patrimonate of the Rhine, seated on a hill on the Satzbach, and accommodating the Roman catholics, Lutherans, and Calvinists, in their respective worship. It is famous as the birth-place of Philip Melancthon. It was set on fire by the French in 1589; distant 21 miles S. from Heidelberg, and 18 S. E. from Spire.

BRETEVILLE sur Laïe, a town of France, in the department of the Calvados, and chief place of a canton in the district of Falaîne; 10 miles N. N. W. of Falaîne. The place contains 790, and the canton 14,450, inhabitants; the territory comprehends 230 kilometres, and 41 communes.

BRETEVILLE l'Orquenville, a town of France, in the department of the Calvados, and chief place of a canton in the district of Caen; 2 leagues W. N. W. of Caen.

BRETTIGAU. See Prettigau.

BRELAY, a town of France, in the department of the Seine and Oise, and district of Mantes, one league S. W. of Mantes.

BREVA, a town of France, in the department of the Upper Marne, and district of Chaumont, 6 miles S. of Bourmont.

BREUDEL, John Philip, in Biography, a Dutch physician of eminence, who lived the latter end of the 17th and the beginning of the 18th centuries, only now known by a "Collection of medical consultations," which he published in 1615, at Franckfort, 4to. and which were much esteemed.

BREUDEL, Zachary, born at Jena in Saxony, in 1592, was initiated into the knowledge of medicine by his father, who was one of the professors in that university. In 1617, he was made doctor, and, on the decease of his father, professor in medicine, an office which he filled several years with distinguished attention and ability. He has left several works, the principal of which are "Chemia in artia formam redacta," Jena, 1650, 12mo.; "De Medicina, arte nobilitissima," 1629, 4to.

BREUDEL, Adam, professor in anatomy and botany in the university of Wittemberg, distinguished for his knowledge of the Greek language, as well as for his skill in his profession, published, in 1700, a collection of inaugural dissertations, among which Haller notices, as of superior value, "De hydropoe ovarii maliebris," in which he gives an accurate description of that organ; "Embryonem in ovulo ante conceptum," an opinion which is now pretty generally accepted to; "De nutricione fetus in utero materni." He also published "De lapidicna microcosmi," 4to. 1701, showing the varieties in stones found in the kidneys and bladder. He relates the case of a young woman who destroyed a fetus she was pregnant with, and procured abortion, by palling a fillet up the vagina into the uterus, but her life fell a sacrifice to the experiment: also, "Observationum anatomicae decades tres," 4to. They came out from 1696 to 1678. In the third part he describes the exhauling vessels of the heart.

BREVE, Brevis, short, in Grammar.—Syllables are distinguished into long and breve, according as they are pronounced quicker or more slowly; the time of a breve is half that of a long, or, as the grammarians express it, a breve is one time, and a long two. See Accent.

Breve, is used in the civil Law for a short note or minute.

In which sense the word is also written brevis (subauda libellus) and in English Brief or breve: amounting to much the same with what is otherwise called schedula and brevicia. See Brief.

Breve more particularly denotes a list or register of the names of the forders under the command of a general.

Breve more particularly used in Common Law for a writ or brief; by which a man is summoned or attached to answer in action; or by which any thing is commanded to be done in the king's courts, in order to justice &c. It is called "breve" from the brevity of it; and is directed to the chancellor, judges, sheriffs, and other officers. See Writ. Hence, Breve perquirere, is to purchase a writ or licence of trial in the king's courts by the plaintiff; and on this depends the usage of paying to the king in suits for money on bond, 6s. 6d. when the debt is 40l. and 10s. when it is 100l.

Fitzherbert has given a new Natura Brevium; thus called by way of distinction from an Old Natura Brevium, composed about the time of Henry III. There is a copy of this book of Fitzherbert filled with manuscript notes by Sir M. Hales, in Dr. Williams's Library in Red Cross Street.

Breve de recto, see Recto.

Breve, in Maffe, is a note or character of time, formed square without any tail; and equivalent to two measures, or semibreves. See Characters of mafe, and Semi-breve.

In fugues, tempo di capella, of two semibreves in a bar, the movement is said to be alta breve, from a bar containing one breve or two semibreves, and from the rapidity with which these seeming long notes are executed; breves as quick as semibreves, and semibreves as quick as minimas, &c. See Time-table, and Notation.

Breve, Breve de Bengal, Breve des Philippines, and
Breves de Madagascar, in Ornithology, names given by Buffon to different varieties of Corvus Brachyrurus.

Brevis, u. See Vans brevis.

Breven, in Geography, a mountain of Switzerland, situated on the side of the valley of Chamouny, and opposite to the glaciers. The height above the Mediterranean is calculated at 8538 feet.

Breven, in the French Law, denotes an act issued by a secretary of state, importing a grant of some favour or donation from the king. The word is formed from the middle age Latin, brevettum, of breve, short. In which sense brevet amounts to much the same with our warrant. They say a brevet of nomination, a duked by brevet; such a person had a brevet of a marshal of France.

Brevet more particularly denotes the commission of a full-barter officer being only written on parchment, and without seal. A brevet-office is one whole rank is above his pay; e.g., a brevet-major serves only as a captain, and receives pay as such. Hence, a full-barter, who obtains rank by brevet is under a necessity of discharging the additional expenses of his new dignity, together with the fees of his new commission, without additional pay.

Brevet, in the Sea Language, is sometimes used for a bill of lading.

Breughelet, or Breughelet, Peter, in Biography, commonly called Old Breughelet, in contradistinction to his son, an eminent painter and engraver, was born at Breughelet, a village near Breda in 1510, and acquired the first principles of his art from Peter Cock or Koeck-van-Ael, whole daughter he married. He afterwards travelled in France and Italy; studied nature, amidst the mountains of Tyrol and the scenery of the Alps; and availed himself of the works of the greatest masters in Italy. On his return from Italy he resided for some time at Antwerp, and from thence he removed to Bruffel. Whilst he was employed by the magistrates of this city in taking views of the canal which falls into the Scheldt, he sickened, and died in 1570; after having caufed to be burned in his presence all his licentious and fatirical designs. He chiefly excelled in landscapes, and droll subjects, resembling those of Jerom Bosch; and he was particularly fond of representing the marches of armies, robberies, skirmishes, sports, dances, weddings, and drunken quarrels; and in order to acquire greater skill and accuracy in this kind of representations, he often affumed the habit of a penfiant, and joined the meaner boors at their feats and amusements. His figures were correct, and their draperies well chozen; the heads and hands were touched with spirit; and his expression, though not elegant, was true. His principal performance is in the emperor's collection at Vienna, which is the "Representation of the building of the tower of Babel, by Nimrod." Several of his paintings are in the cabinets of the emperor and elector palatine, and dispersed through various parts of Europe. For his amusement he engraved some few landscapes and grotesque subjects. Pilkington and Strutt.

Breughelet, Peter, the younger, known by the appellation of the "Hellish Breughelet," from his delight in representing horrible subjeft, the son of the preceding artist, was born at Bruffel, and became the disciple of Gelles Coninglou. His compositions rather excite disgust than satisfaction; and his human figures, though freely pencilled and not ill coloured, are not much more elegant than those of the infernal kind. In his historical subjefts he generally introduced witches and devils; such as Orpheus charming Pluto and Proserpine to procure the deliverance of Eurydice, surrounded with horrible forms and appearances; Saul and the witch of Endor; or St. Anthony's temptations. He also was an engraver. He died in 1643. Pilkington and Strutt.

Breughelet, John, distinguished from his mode of dress by the appellation of "Velvet Breughelet," was the son of Peter Breughelet the Old, and born at Bruffel in 1560. He was instructed, probably, by his father, and by other artists; but, whoever were his instructors, he acquired an eminence in every art of painting, in colouring, in design, and in pencilling, far superior to that of his father, and of all his contemporaries in his style. He began with painting flowers and fruit, which he executed with admirable skill; and then proceeded to landscapes, sea-pieces, and markets, in which he introduced a number of small figures, surprizingly exact and correctly drawn. At Cologne, where he resided for some time, he gained an extraordinary reputation; and his pictures were well known and admired in Italy, in which country he spent some time. He died, according to the most probable accounts, in 1625. That the industry of this artist must have been singular, sufficiently appears from the number and variety of his pictures, and the exquisite neatness and delicacy of their execution. It has been lamented, however, by connoissours, that his distances are overcharged with a bluish tinge. Breughelet often decorated the pictures of his friends with small figures, thus greatly enhancing their value; he was employed in painting flowers, fruits, animals, and landscape scenery, in the pieces of history-paintings; and in this way Rubens made occasional use of his pencil. He sometimes joined this matter in larger works, which have been much admired; and particularly in a "Vertumnus and Pomona," a picture three feet high and four broad, highly commended by Houbraek, and sold at Amsterdam for above 280l. "Ering; and "a Terrestrial Paradise," painted for Charles I. king of England. In the gallery of the archiepiscopal palace at Milan, there is an admirable landscape of Breughelet, representing a desert, in which Giovanna Battia Crephi painted the figure of St. Jerom; and among a great number preserved in the Ambrosian library in that city, there is an oval picture of the Virgin, painted by Rubens, which is encompassed by a garland of flowers admirably executed by Breughelet. Most considerable cabinets poiffe speciments of the art of this master. Some small engravings of landscapes &c. are also ascribed to Breughelet. Pilkington and Strutt.

Breughelet, Abraham, called the Neapolitan, was born at Antwerp in 1515; and removing to Italy at an early age, he studied with such success, that he acquired a degree of reputation, which made his works much sought for, and highly valued. Nature was his model; and he represented his objects with elegance and truth, with a warm and natural colouring, and with a broad and free touch, which indicates a ready and expert hand. The performances of this master are classed among those of the most admired artists. The fortune, acquired by his profession, was considerable; but, he left the whole of it by the dishonesty of a merchant in whom he confided, and died in consequence of the grief occasioned by this misfortune. Pilkington.

Breughelet, Peter, of Bois le Duc, took his degree of doctor in medicine at Padua, and was in such esteem with Philip II. king of Spain, that he was by his command appointed professor in medicine at the university of Louvain, though, from his frequent attendance on the nobility in the neighbouring provinces, he was not able to perform the duties of that office. On his death, which happened in the year 1577, he left a sum of money to found a college at Louvain for his students, who were to be instructed in the different branches of medicine. The college, which is still
in existence, bears the name of the founder; but no addition having been made to the revenue, it is now only capable of maintaining three students. Eloy, Dict. Hist.

BREVIA, a title, mentioned by Ecclesiastical Writers, were written memorandums, introduced to perpetuate the tenor of the conveyance and infeuditure of lands, when grants by parol only became the occasion of dispute and uncertainty. To this end they were registered in the deed the persons who attended as witnesses, and heard it read without signing their names; the clerk adding their names in a fort of memorandum. Modern deeds are an improvement and amplification of these. Blacklone's Comment. vol. ii. p. 337.

BREVIAIRE, to abbreviate or reduce a thing into a shorter compas. This is otherwise called abbreviare and in abbreviari.

BREVIAIUM, is more particularly used among Roman writers, to denote a book introduced by Augustus, containing the accounts of the empire. The design of it was for giving an account to the people how the monies levied on them were applied. The emperor Tiberius laid aside the breviarium, but it was resumed by Caligula.

BREVIA, an epitome and abridgment, or short flate of a thing. The word is Latin, breviation, though not pure, as appears from Seneca, who observes, that the ancients, in lieu of it, used summarium.

BREVIA was also used among the ancients for the place where the briefs, or what was written abbreviated, were preferred.

BREVIA, among Ecclesiastical Writers, denotes the office or service, both for day and night, as performed in the Romish churches.

BREVIA is more frequently used for a church-book, containing the office of the brevialry, that is, the prayers, and other parts of the service, with the several variations to be made therein, according to the several days, canonical hours, feasts, and the like.

D. Mege derives the name breviali from hence, that the ancient monks in their journeys, &c. had little books, wherein were the psalms and lefions read in the choir, collected out of large volumes: and F. Mabillon tells us, he has seen two such books in the archives of Citeaux; they were not above three fingers broad; their letter was exceedingly small, and confided mottly in abbreviations, preserving a whole period in a few syllabaks: whence they had a good tide to the appellation of breviaries, q. d. abridgments. Some deduce the appellation breviali hence, that when the popes retired in the Lateran palace, the office was read in the papal palace was much shorter than that said in the other churches of Rome; which office, thus abbreviated, was compiled by Innocent III., and called officium capellare, till such time as the Franciscan friars adopted the same, in conformity to the papal chapel, it became denominated breviarium, and shortly after was in general use. Marg. Vocab. Eclecf. p. 38. Menag. Orig. Franc. The first time the word breviali occurs, in the sense of a church-book, is in a letter of the archbishop of Lyons to the bishop of Langes, in 1009; or rather by Micrologus, who lived in 1080.

The Roman breviali is general, and may be used in every place: but on the model of this have been formed various others, peculiarly appropriated to each diocese, and each order of religious.

The breviali consists of the services of matins, lauds, prime, third, sixth, none, vespers, and the complines, or poff-communio; that is, of seven different hours; on account of that saying of David, Septies in die laudem dixi tibi. The obligation of reciting the breviali every day, which was at first universal, by degrees was reduced to the beneficiary clergy alone, who are bound to do it on pain of mortal sin, and of refunding their revenues, in proportion as they are delinquent herein. In the fourteenth century, there was a particular reservation in favour of bishops, for palfing, on occasion, three days without rehearsing the breviali. The institution of the breviali not being very ancient, the lives of the saints were infected in it, agreeable to the opinions of the times, i. e. full of ridiculous ill-attired facts; which gave a handle to several purgations, or reformations thereof, by several councils, particularly those of Trent and Cologne; by several popes, as Pius V. Clement VIII. and Urban VIII. as also by several cardinals and bishops, each of whom lopped off some of the extravagancies, and brought the work nearer to the simplicity of the primitive offices; as acknowledging, that in the ancient church there was nothing read, but scripture itself. Cardinal Nigron carried the reformation the farthest; leaving out the little office of the Virgin, the verbes, responses, and a great part of the lives of the saints.

The breviaries now in use are almost innumerable: the difference between them consists principally in the number and order of the psalms, hymns, pater-nosters, ave-maries, credos, magnificats, cunctemufes, benedictures, canticles, nunix mitissimes, missaeres, balleius, glorypatris, &c.

The most eminent, after the Roman breviali, are those of the Benedictines, of the Bernardines, of the Chartreux, of the Præmonstratens, of the Carmelites, the Franciscans, and Jesuits; also that of Cluni, of the church of Lyons, the church of Milan, and the Mozarabic breviali used in Spain. But, in reality, there is scarcely a church in the communion of Rome, in France, Flanders, Spain, Germany, &c. that has not something particular in the form and manner of its breviali, though the differences are generally incon siderable. See Ambrosian, Gallican, &c.

The breviali of the Greeks, which they call μουσείον, horologium, q. d. dial, is nearly the same, in almost all the churches and monasteries that follow the Greek rite. The Greeks divide the psalter into twenty parts, μυχολογια, which are a kind of refts, pautes, or stations; and each paute is again subdivided into three parts. In general, the Greek breviali consists of two parts; the one containing the office for the evening, called μεσολογια; the other that for the morning, consisting of matins, lauds, prime, tierce, sixth, none, vespers, and complines. The breviali of the Maronites contains some more considerable variations.

Among the people who speak the Slavonic language, or any of its dialects, the breviali is recited in the vulgar tongue, as among the Maronites in Syria, among the Armenians in Armenia, &c. Those who recite the breviali in the Slavonic, are divided as to the rite; some following the Roman or Latin rite, as the inhabitants of Dalmatia and the neighbouring coasts; whereas those who live farther within the continent as in Hungary, Bohemia, Slavonia, &c. and in Poland, Lithuania, and Muscovy, follow the Greek rite. The breviali of the Copts and Abyssinians are much alike.

BREVIAE, is sometimes used for an abridgment, or short extract of a book or paper. Phil. Trans. No 57. p. 2212.

BREVIA, an officer under the eastern empire, whose business was to write and transcribe briefs. At Rome, those are still called breviators, or abbreviators, who dictate and draw up the pope's briefs. See Abbreviator.

BREVIDUS, et Rotulus liberandus, in Law, a writ or mandate
mandate to a sheriff, to deliver to his successor, the county, and the appurtenances, with the rolls, briefs, remembrances, and all other things belonging to that office.

Brevicornis, in Entomology, a species of Cerambyx that inhabits Sierra Leona in Africa. The thorax is un

Brevicornis, a species of Neoclytus found in Guinea. The wing-cases are very minute: head and thorax fuscous, with a longitudinal yellow line: antennae, very short and thick. Gmel. &c.

Brevicornis, a species of Cerambyx of an obscure or dull cuprous colour: antennae, very short and compressed; the anterioi thighs dentate. Fabr. This sort is from China.

Brevicornis, a species of Tipula of a black glossy colour: margin of the wings blackish: abdomen fuscous: anterior sers' spinous. Fabr. A native of Europe, called by Degeer, Tipula flavicnuda.

Brevicornis, a species of Monoculus that inhabits marches overgrown by the sea. It is simply described as having the hairs of the tail very short. Mitt. Stroem, &c. Off. The antennae in the male of this species are hooked; those of the female forked at the tips.

Brevier, among Printers, is the denomination of a small species of letters between minion and burtex. See Painting.

Brevine, in Geography, a town of Switzerland, in the principality of Neuchatel, 12 miles W. of Neuchatel. N. lat. 47°. E. long. 6° 23'.

Brevipes, in Entomology, a species of Staphylinus that inhabits Europe. The colour is deep black: wing-cases and legs tetractic: shanks short. Linn. Inhabits Europe.

Brevipilis, in Zoology, that variety of the dog (Canis) known by the name of king Charles's dog.

Breviss imus, in Anatomy, one of the extensor muscles of the cubitus, arising from the external spine of the humerus. Breviss radii, one of the supinator muscles of the radius, arising partly from the external condylus of the humerus, and partly from the upper and external part of the ulna; and inserted into the inferior part of the radius, which it embraces wholly; and serves to turn the palm of the hand upwards.

Breviss is also used by sone for the third of the extendors of the carpus, which, arising from the lower part of the humerus, and running along the radius, terminates in the bone of the carpus which futilities the middle finger. Some anatomists join this with the second extensor, and call them bicorns, or radialis externus: others choose to distinguish them because they have different origins, and insertions; and that their bellies are separable.

Breviss extensor politcis pedis. See Extensor.

Breviss flexor politcis pedis. See Flexor.

Breviss peronaeus. See Peronaeus.

Breviss pronator radii. See Pronator.

Brevity, in a general sense, that which denominates a thing brief or short.

Brevity is more particularly used in speaking of the style or composition of discourse. Brevity of discourse is by some called brachylogy and breviloquity; sometimes insinuous. Tacitus and Periplus are remarkable for the brevity of their style. There are two kinds of brevity; one arising from dryness, poverty, and narrowness of genius; the other from judgment and reflection; which latter alone is laudable. Brevity is so essential to a tale, a song and an epigram, that without it, they necessarily languish and become dull. Rhetoricians make brevity one of the principal marks or conditions of eloquence; but the rules they prescribe for attaining it, are difficult to apply, so as still to keep the due medium between too much and too little.

A full brevity is attained by using all the words which are necessary, and none but those which are necessary. Sometimes it may also be had, by choosing a word which has the force of several. It is this last kind which Quintilian admires so much in Sallust; and the imitation of which, by other writers, has caused so much oblivion. See Obscurity. Breviornus et,
was known to the Spaniards, the Gauls, and the inhabitants of the British islands, and the north of Europe. All the ancient malt liquors, however, seem to have been made entirely of barley, or some other farinaceous grain, and therefore were not generally calculated for long keeping, as this quality depends considerably, though not entirely, on the bitter extract of hops, or other vegetables, with which the liquor is mingled.

Modern malt liquor is essentially composed of water, of the soluble parts of malt and hops, and of yeast.

For a particular account of the preparation of Malt, we refer our readers to that article. It will be sufficient for our present purpose, to mention, that barley consists of endosperm or starch, albumen, and a little gluten; and, that by the procés of germination or malting, the starch is converted into saccharine mucilage. If each grain of barley was perfectly malted, the whole of its starch would be changed into sugar; this, however, is never the case; the soluble contents, therefore, of such malt as the brewers make use of, arranged in the order of their respective proportions, are saccharine mucilage, starch, albumen, and gluten, of which only the first is absolutely necessary for the production of a vinous liquor. Three or four different kinds of malt are distinguished by the brewer by their colours, which depend on the degree of heat that was used in the drying. Malt that has been dried by a very gentle heat scarcely differs in its colour from barley; if exposed to a somewhat higher temperature, it acquires a light amber-yellow hue; and by successive increments of heat, the colour becomes deeper and deeper, till, at length, it is black. The change of colour is owing to the grain being partially charred or decomposed; and in proportion to the extent to which this alteration is allowed to proceed, will the produc of sugar, that is of fermentable matter, be diminished. The principal advantage of high-dried malt over the paler kind, is the deep yellowish brown tinge which it gives to the liquor: but this colour may be communicated much more economically by burnt sugar. The malt, whether pale or high-dried, must be bruised between rollers, or coarsely ground in a mill before it is used, and it is found by experience, that malt which has lain to cool for some weeks is, in many respects, preferable to that which is used as it comes hot from the mill. The first step in the process of brewing is

§ 1. Malting.

This is performed in the malting-tun, which is a circular wooden vessel, shallow in proportion to its extent, and furnished with a false bottom, pierced with small holes, fixed a few inches above the real bottom: when it is small, it ought to have a moveable wooden cover. There are two side openings in the interval between the real and false bottom: to one is fixed a pipe for the purpose of conveying water into the tun; the other is fitted with a spigot for the purpose of drawing the liquor out of the tun. The malting commences by bruising the grain or bruised malt evenly over the false bottom of the malting-tun, and then, by means of the side pipe, letting in from the upper copper the proper quantity of hot water. The water first fills the interval between the two bottoms, then forcing its way through the holes in the false bottom, it flows into the grist, which, at first floating on the surface of the water, is thus raised off the bottom on which it was spread. When the whole of the water is let in, the process of malting properly so called, begins. The object in malting is to effect a perfect mixture of the malt with the water, in order that all the edible parts may be extracted by this fluid: for this purpose, the grist is first incorporated with the water by means of iron rakes, and then the mals are beaten and agitated, and still further mixed by long flat wooden poles, resembling oars, which indeed is the name by which they are technically known. In some of the large porter breweries, the extent of the tun is so great, that the process of malting cannot be adequately performed by human labour, and recourse is had to a very simple and efficient instrument for this purpose. A very strong iron scoop, of the same height as the malt-tun, is fixed in the centre of the vessel; and from this proceed two great arms or mals, of iron, and bent with vertical iron teeth a few inches slender, in the manner of a double comb: by means of a steam engine, or any other moving power, the iron arms which at first rest on the false bottom, are made slowly to revolve upon the central scoop, in consequence of which, in proportion as they revolve, they also descend through the contents of the tun to the surface; then, inverting the circular motion, they descend again in the course of a few revolutions to the bottom. These alternate motions are continued till the grist and water are thoroughly incorporated. When the malting is completed, the tun is covered in to prevent the escape of the heat, and the whole is suffered to remain still, in order that the insoluble parts may separate from the liquor: the side spigot is then withdrawn, and the clear wort is allowed to run off, slowly at first, but more rapidly as it becomes fine, into the lower or boiling copper.

The operation of malting, as it is the first in order, is the most important; and all the succeeding ones are modified according to the circumstances, under which this primary one is effected. The principal thing to be attended to, is the temperature of the malt, which depends, partly on the heat of the water, and partly on the state of the malt. If any quantity of barley is mingled with twice its bulk of water, the temperature of the mals will be very nearly that of the mean temperature of the ingredients. If the pale malt is subjected to the same experiment, the temperature will be somewhat greater than that of the mean heat. This excess is found to increase very rapidly, in proportion to the colour or dryness of the malt employed; so that when one part of the highest dried malt is mixed with two parts of warm water, the temperature will be no less than 140° Fahr. above the mean. In calculating, therefore, the heat of the malt, it is necessary to take into consideration, both the dryness of the malt, and the proportion which it contains of unmalted, or imperfectly malted barley. The object in malting is to extract from the malt, as much as possible of the saccharine mucilage; but this is so intimately combined with the other parts of the grain, that the range of temperature which can be employed for this purpose, is very confined. If the water was let upon the grist boiling hot, the starch which it contains would not only be dissolved, but converted into a gelatinous substance, in which all the other parts of the malt, and mals of the water, would be entangled, beyond the possibility of recovery by any after-processes; and great loss is perpetually sustained by inattentive brewers, from this very circumstance. The most eligible temperature upon the whole for malting, appears to be about 120° to 130° of Fahrenheit: the heat of the water, therefore, for the first malting, must be somewhat below this temperature, and the lower in proportion to the dark colour of the malt made use of. Thus, for pale malt, the water of the malt may be at 120° and upwards; but for high-dried brown malt, it ought not much to exceed 120°. The wort of the first malting is always by much the richest in saccharine matter; but to exhaust the malt, a second and third malting is required; and no heat is generated, except in the ill malting, the water in the succeeding ones may be
be fairly raised to nearly 150°. The proportion of wort to be obtained from each bushel of malt, depends entirely on the proportioned strength of the liquor. For small beer, 30 gallons of wort may be taken from each bushel of malt; but for the strongest ale, only the produce of the first mashing, or about 65 gallons per bushel, is employed. But whatever be the proportion of wort required, it must be held in mind, that every bushel of well made malt will absorb, and retain 31 gallons of water, and, therefore, the water made use of must exceed the wort required, in the same proportion.

It is of great importance to the brewer, to ascertain the strength of his worts, or their richness in saccharinaceous matter; this may be done, partly by the tate, but more accurately by an instrument called a Saccharimeter, which in fact is only a hydrometer, the scale of which is adapted to the various denitutes of wort. The name Saccharimeter, however, is an improper one, as it is apt to mislead the brewer; this instrument shows merely the specific gravity of the liquor, and this depends, not only upon the sugar, but the starch, and every other part of the malt which is soluble in water. But the relative proportions of these substances are, in all likelihood, very various in different parcels of malt; whence arises a serious objection to much dependence on the Saccharimeter.

§ 2. Boiling and hopping.

If one kind of liquor (whether ale or beer) is to be made, the produce of the three mashings is to be mixed together; but, if both ale and beer are required, the wort of the first, or of the first and second mashing, is appropriated to the ale, and the remainder is set aside for the beer. All the wort defined for the same liquor, after it has run from the mash-tun, is transferred to the large copper, and mixed while it is heating with the required proportion of hops. The stronger the wort, the larger proportion of hops does it demand; and this is calculated in two ways, either according to the quantity of malt employed, or the richness of the wort. Where the former basis of calculation is referred to, the quantity of hops, especially in private families, where economy is not so strictly attended to as in large establishments, is one pound of hops to a bushel of malt, whether the wort is intended for the strong ale, or the weakest small beer. In public breweries, the proportion of hops is considerably smaller, and is regulated, not merely by the quantity of malt, but the richness of the wort. For strong ales, the common proportion is about 1 pound of hops to 1.5 bushel of malt; for beer, the quantity is lowered to 1 pound of hops to 1.7 bushel of malt. When both ale and beer are brewed from the same malt, the usual practice is to put the whole quantity of hops in the ale wort; and after they have been boiled a sufficient time in this, to transfer them to the beer-wort, in order to be exhausted by a second boiling.

When the hops are mixed with the wort in the copper, the liquor is brought to boil; and the best practice is to keep it boiling as fast as possible, till, upon taking a little of the liquor out, it is found to be full of minute flakes, like curdled foap. These flakes consist of the gluten and starch of the malt separated from their former solution in the wort, by the joint action, in all probability, of the heat, and the bitter extract of the hops. For the ascertaining of this important question, no regular experiments, however, have been as yet instituted.

The boiling copper is in most breweries uncovered, but in some it is fitted with a steam-tight cover, from the centre of which passes a cylindrical pipe, that terminates by several recurved branches in the upper or mashing copper: the steam, therefore, produced by the boiling, instead of being wafted, is let into the cold water of the upper copper, and thus raises it very nearly to the temperature required for mashing, besides impregnating it very sensitively with the essential oil of the hops, in which the whole of the flavour resides, and which would otherwise be discharged into the air, and thus be lost.

§ 3. Cooling.

When the liquor is sufficiently boiled, it is discharged into a number of shallow tubs called coolers, where it remains exposed to a free draught of air, till it has deposited the hopfeeds and coagulated flakes with which it was charged, and is become sufficiently cool to be submitted to the next process, which is that of fermentation. It is necessary that the process of cooling should be carried on as expeditiously as possible, particularly in hot weather; for unfermented wort, by exposure to a hot cloae air for a few hours, is very liable to contract a noxious firrle and talle, when it is laid technically to be fixed, in consequence of small spots of white mould forming on its surface. Liquor made from pale malt, and which is intended for immediate drinking, need not be cooled lower than 75° or 80°, and in consequence may be made all the year through, except perhaps during the very hottest season; but beer from brown malt, especially if intended for long keeping, requires to be cooled to 65° or 70°, and therefore cannot possibly be made except in cool weather; hence it is that the months of March and October have always been reckoned peculiarly favourable to the manufacture of the belt malt liquor.

§ 4. Tunning and barrelling.

From the coolers the liquor is transferred into the fermenting or working tun, which is a large cumbous wooden vessel capable of being closed at pleasure. As soon as the wort is let in, it is well mixed with yeast, in the proportion of about one gallon to four barrels, and in about five hours afterwards the fermentation commences. The signs of fermentation are muddines of the liquor, the formation of froth or yeast on the surface, and a copious dilugement of carboonic acid. In the first stage of fermentation, on taking some of the yeast in a bowl it soon falls down into a liquid; but when the fermentation is sufficiently established to allow of barrelling, the yeast has a certain degree of toughness, and will remain a long time without falling in. When the wort is let down hot into the working tun, the fermentation is conducted with the tun closed, and proceeds rapidly, so that in about 18 or 20 hours it is fit to be cleaned or put into the barrels; but when the wort is let down at 65° it requires 48 hours for the first fermentation, and is peculiarly liable to be affected by a considerable change of weather.

Although, in common practice, the coagulated ferment and gluten are deposited and left in the coors, yet, skilful brewers mix them again with the wort by agitation, and ferment the liquor in this state. Fermentation is considerably retarded by this practice; but, in return, the liquor is much clearer and more completely fermented, as is obvious from the remarkable diminution of specific gravity which it undergoes.

The last process is transferring the liquor from the working tun to the barrels, when the fermentation is completed. During a few days, a copious discharge of yeast takes place from the bung-hole, and the barrels must be carefully filled up every day with fresh liquor; this discharge gradually becomes less, and in about a week ceases; at which time the bung-hole is closed up and the liquor is fit for use, after standing from a fortnight to three months according to its strength, and the temperature at which it has been fermented.
BRE

BREWING, among Distillers, denotes the method of extracting the more soluble parts of vegetables with hot water, and thus procuring a solution or decoction fitted for vinous fermentation.

In which sense brewing is a necessary step towards distillation.

A fermentable solution, fit for yielding a spirit, or brandy, is obtainable from any vegetable, under proper management; but the more readily and perfectly the subject diffuses, the better it is distilled for fermentation, and the production of brandies. Thus sugar, honey, treacle, manna, and other infusificated vegetable juices, which totally unite with water, into a clear and uniform solution, are more immediate, more perfect, and better adapted subjects of fermentation than roots, fruits, or herbs, in substance, the grains, or even malt itself; all which diffuse but very imperfectly in hot water.

Yet malt, for its cheapness, is generally preferred in England, and brewed for this purpose, much after the common manner of brewing for beer; only the worst malt will serve for distillation; and the tincture, without the addition of hops, and the trouble of boiling, is here directly cooled and fermented.

The grain intended for brewing is previously malted, to prepare it for dissolving more easily and copiously in the water, so as to afford a richer tincture or solution, which, after due fermentation, will yield about one half more of proof spirit than the tincture of an equal weight of unmalted corn.

Brewing is also used, in an ill sense, for the counterfeiting and compounding especially of wines. Vintners and wine-coopers are suspeetful of brewing wines, or giving divers inferior sorts, to imitate some better kind. The necessity of accommodating their liquors to the palates of their guests, is another cause of brewing; inomuch that some have confessed they commonly draw out of two or three casks for every pint.

BREWING, the appearance of a collection of black and tempestuous clouds, arising gradually from a part of the horizon, being an indication of an approaching storm.

BREWINGTON, Fort, in Geography, lies in the township of Mexico, New-York, and at the west end of lake Oneida, about 24 miles S. W. from Fort Oswego.

BREWWOOD, or BREWED, a market-town of Staffordshire, England, consists of 581 houses, and 2803 inhabitants, the greater number of whom are engaged in the iron manufacturies. The bishop of the diocese had formerly a seat here, and a small Benedictine monastery was founded here in the time of Richard I. A large free grammar school is established in this town. Here are a market on Fridays, and one fair annually. Gough's edition of Camden's Britannia, vol. ii.

BREY, a small town of Germany, in the circle of Weilphalia, and bishopric of Liege, seated on the river Neck, 29 miles N. of Liege.—Allod, a town of Upper Gueckelheim, 6 miles W. of Venlo.

BREYDA Fjordor, a bay of Iceland, in the west quarter, and in the district called Dala-Systel.

BREYDEL, Charles, called Crisander, in Biography, a painter of landscapes, was born at Antwerp, in 1677, and remained under the instruction of old Rybach, the landscape painter, for three years, after which period he became, in consequence of his close application, competent to commence the practice of his art. Having been diverted from his purpose of visiting Fays, by the encouraging reception which he met with at Frankfurt and Nuremberg, he spent two years with his brother, Francis Breidt, at the court of Hesse-Cassel; and he afterwards went to Amster-
dam, where he copied several views of the Rhine, from the designs of Griffer, and thus improved his colouring, pencilling, and taste of design, so that the works of this artist may be regarded as his second and best school. At length he settled at Ghent, where his performances were much admired; but he was reduced, by extravagance in his drefs, furniture, and table, to the necessity of earning money expeditiously, and to multiply pictures much inferior in design and execution to others, which had been produced by his pencil. His health declined towards the close of his life; and his performances, during the intervals of health, which he enjoyed, amidst recurring paroxysms of the gout, wanted the spirit, delicate fulness, and firmness of touch of his better days. Whistl the ideas and style of Griffer were his models, his pictures, which were views of the Rhine, were well designed, neatly executed, and excellently coloured. But he changed this manner, in order to imitate Velvet Brueghel, whose works were universally admired, and selected for his subjects battles, fiefs, and encampments. He often copied the prints of Vandermonden; but afterwards composed very readily in this style, without borrowing from any other artist. His best pictures are full of spirit, his touch is firm and well adapted to his style, and his design is correct. Some of them appear too laboured, but others are full of harmony. He died in 1744.

BREYDEL, Francis, brother of the preceding, was born at Antwerp, in 1679; and is suppos'd to have been a disciple of old Rybach. At an early age he excelled in portraits, and was appointed painter to the court of Hesse-Cassel, where his works were held in high estimation. From Hesse-Cassel he removed to England, and continued here for several years, with his friend Vandermonden. Besides portraits, he painted conversations, feasts, allegories, and carnivals; and his conversations, as well as his other compositions, are finely executed, agreeably coloured, and well disposed. This artist died in 1759.

BREYER, in Geography, the name of an island on the coast of North America. N. lat. 44° 19'. W. long. 66° 25'.

BREYNIA, in Botany, (in memory of Jac. Breynius, and his son, Jac. Philipp Breynay, both celebrated botanists.) Fördel. 77. Schres. 1655. La Marek Illus. 860. Chis. polygama Chisii.

Gen. Char. 1. Complete flowers. Col. perianth one-leaved, top-shaped, minute, with six segments; segments, concave, blue, closely converging, depressed, flat at the end, so that it is pervious only by a small hole. Cor. none. Stam. filaments none; anthers five, linear, erect, falcated longitudinally to the style, approximating. Pét. germ, very small. Style cylindrical, as long as the calyx; stigma obtuse. Pet. cor. berry, dry, globose, three-celled, supported by the perianth, now increased to three times its former size, and spreading very wide. Sects. two in each cell, convex at the back, flat on the sides. 2. Stenophorae flowers. Col. one-leaved, with five segments; segments roundish, concave, nearly equal. Cor. none. N. I. berry, five glands, on short pedicel, alternate with the stamens. Stam. filaments five, very short; anthers roundish, as long as the calyx. 3. Ptiliflorae flowers. Col. and Cor. as in the stenophorae. Pét. germ globose; style none; stigma five, obtuse, reflexing petals. Pet. cor. five-celled. Sects. solitary, rather threecelled. Native of New Cal. and Panama, in the South Seas.

P 2
BREYLEIDE, in Geography, a town of Flanders, 8 m. of St. Malo.

BREYNEICH. See Braine.

BRIAN, a town, having a castle, of Poland, in the province of Letnegas, and 13 of Mecz.

BRIEUX, a town of France, in the department of the Maine et Loire, 70 m. of Saumur.

BRZOLIJS, or BRZOLIJE, a town of France, in the department of the Eure and Loir, and chief place of a canton in the district of Dreux; 4 leagues W. of Dreux. The place contains 816, and the canton 9351 inhabitants; the territory comprehends 46,4 square kilometres, and 22 communes.

BRUSIO, a small town of Lower Hungary, in the district of Tot. The inhabitants follow agriculture and husbandry.

BRISAC, St., a town of France, in the department of the Hautes Vosges, and in the district of St. Malo, ½ league W. of St. Malo.

BRACKLAND, about 2 miles long from N. N. E. to S. S. W., lies on the coast of France, in the English channel, See Brehat.

BRIANDON, a town of Asia Minor, in Syria, 120 miles N. E. of Damascus.

BRIANDON, or BRION, a town of Asia Minor, and chief place of a district, in the department of the Higher Alps, situated on the Durance, surrounded with rocks and mountains, and defended by forts and redoubts; 14 leagues N. E. of Gap. The place contains 297, and the canton 7187 inhabitants; the territory includes 2544 square kilometres and 8 communes; N. lat. 44° 36'; E. long. 6° 45'.

BRIANDONNE, the name, before the revolution, of a district of France, in the province of Dauphiné, about 12 leagues long and 6 wide, comprehending several valleys, which are situated among the Alps. The air is cold in winter, and warm in summer. The inhabitants are sober, active, industrious; they cultivate some wheat and fruit, and feed flocks of sheep, and gather honey from the trees, and make some wine. This district now forms a part of the department of the Lower Alps. Its inhabitants were formerly known to the Romans under the appellation of Brigantes.

BRIANIS. See Piantis.

BRIANZA, mountains of Italy, near the lake of Como, in the Milanese.

BRIAR, in Botany, a name given to many species of the rose.

BRIAS, in Geography, a water of Savannah river, in Georgia; the mouth of which is about 50 miles S. E. by N. from Augusta, and 55 north-westly from Savannah.

BRIERE, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Gien, situated on the Loire, and 2 leagues S. E. of Gien. The place contains 1675, and the canton 7700 inhabitants; the territory includes 320 kilometres, and 14 communes. At this town commences the canal, which unites the Loire and Seine. N. lat. 47° 40'; E. long. 2° 45'.

BRIAREUS, in Fabulous History, a giant, the son of Acheron, Titan, or Cetus, and Terra. This was his celestial appellation; on earth he was called "Egeon." Jupiter derived singular favour from him, when Juno, Pallas, Neptune, and other gods, endeavoured to bind him in chains, and to de-throne him; though he afterwards conspired with his brethren, the giants, to dethrone Jupiter. Virgil describes him (Aen. x. 365.) on this occasion, as having 100 hands, 50 heads, and breathing out fire. According to the fable, Jupiter punished him by throwing him under-ground Etna, which, as often as he moves, belches out fire.

BRIAREUS, in Natural History, a species of Gorgone, found in the West Indian Seas. This kind is sub-truncate, round, black, rising from a broad dilated base; the skin white within; externally grey; flares large, bearded, with eight tentacles; each composed of small glairy needles of a purple colour irregularly, and compactly disposed in a longitudinal manner. Elder, Sander, &c.

BRIASCA, in Geography, a town of European Turkey, in Moldavia; 36 miles E. of Jaffa.

BRIATEXTE, a town of France, in the department of the Terr, and the district of Lavaur; 1½ league N. E. of Lavaur.

BRIATICO, a town of Napels, in the province of Calabria Ultra; 11 miles N. E. of Nicotera.

BRIACH, a river of Swabia, in the Black forest, which rises near the source of the Danube, and unites with the Rhine below the town of Dornfichingen.

BRIBE, a reward given to prevent the judgment, or corrupt the conduct. See Bribery.

The word is French, brique, which originally denotes a bit, fragment, or relic of meat taken off the table; on which forgiving, brique imports as much as pænis mendicatus, and still keeps up the idea of the matter whereof bribes ancienly consisted. Hence also the Spaniards use brihag and brihag for begging; and briccia, briconnieria, and briominfio, for beggary. Menag. Orig. France, p. 131. Skinner Etym. in voc. In Middle Age Writers, a bribe given to a judge, is called quota litis, and the receiver, campi particeps, or canib particeps; because the spoils of the field, i.e. the profits of the cause, were thus shared with the giver. Du-Cange. Gloss. Lat. tom. i.

BRIERY, in Common Law, is when a person, occupying a judicial place, takes any fee, gift, reward, or brocage, for doing his office, or by colour of his office, except of the king only. In a larger sense, bribery denotes the receiving or offering of any undue reward, to or by any person concerned in the administration of public justice, as an inducement for acting contrary to duty; and sometimes it signifies the taking or giving of a reward for a public office.

In the earl it is the custom never to petition any superior for justice, kings not excepted, without a present; a practice adapted to the genius of despotic countries. The Roman law, though it contained many severe injunctons against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bartering of common justice, nevertheless tacitly encouraged this practice; because it allowed the magistrate to receive small presents, provided they did not in the whole amount exceed a hundred crowns in the year. Plato, in his ideal Republic (De Leg. i. 2.) more wisely orders those who take presents for doing their duty to be punished in the severest manner; and by the laws of Athens, the offerer as well as the receiver of a bribe were prosecuted. In England, this offence of taking bribes is punished, in inferior officers, with fine and imprisonment; and in those who offer a bribe, though not taken, the same. (3 Inst. 147.) But in judges, especially the superior ones, it has always been regarded as a very heinous offence; insomuch, that anent it was punished as high treason, and the chief justice Thorp was hanged for it in the reign of Edw. 111.; and at this day it is punishable with forfeiture of office, fine, and imprisonment. By statute

11 Hen.
11 Hen. IV. all judges and officers of the king, convicted
of bribery, shall forfeit treble the bribe, he punished at the
king's will, and be discharged from the king's service for
ever.

Officers of the customs taking any bribe, whereby the crown
may be defrauded, forfeit 100l., and are rendered incapable
of any office; and the person giving the bribe or offering any
bribe to officers of the customs, to induce them to connive
at the running of goods, shall forfeit 50l. See CUSTOMS.

Candidates that bribe electors, after the date or of the
writs, or after the vacancy, by giving or promising any
money or entertainment, are disallowed to serve for that place
in parliament; and he that takes as well as he that offers a
bribe, forfeits 500l. and is for ever disallowed from voting,
and holding any office in any corporation, unless, before conviction,
he discovers some other offender of the same kind,
whereby he is indemnified for his own offence. The oath
against bribery, in the election of members of parliament, is
as follows: “I do swear, I have not received, or had, by
myself, or any peron whatsoever, in trust for me, or for my
use and benefit, directly or indirectly, any sum or sums of
money, office, place, or employment, gift, or reward, or
any promise or security, for any money, office, employment,
or gift, in order to give any vote at this election.”

Upon this oath, archdeacon Paley (Principles of Moral and
Political Philosophy, vol. i. p. 208.) remarks, that the
several contrivances to evade this oath, such as the electors
accepting money under colour of borrowing, and giving a
promissory note, or other security for it, which is cancelled
after the election; receiving money from a stranger, or a
person in disgrace, or out of a drawer or purse, left open
for the purpose; or promises of money to be paid after the
election; or flippulating for a place, living, or other private
advantage of any kind; if they escape the legal penalties of
perjury, incur the moral guilt: for they are manifestly
within the mischief and design of the statute, which imposes
the oath; and within the terms of the oath itself; for the word “indirectly” is inserted on purpose to comprehend
such cases as these. See PARLIAMENT. Blackstone’s

BRIBEKOU, in Geography, a town of Africa, on the

BRIBIESCA. See BRIBIESCA.

BRICE, Sir, a town of France, in the department of
the Ille and Vilaine, and chief place of a canton, in the
district of Fougères; 24 leagues N.W. of Fougères. The
town contains 1192, and the canton 13,810 inhabitants;
the territory comprehends 150 kilometres, and 11
communes.—Allo, a town of France, in the department of
the Seine and Oise; 3 leagues N. of Paris.—Allo, a town of
France, in the department of the Yonne; 2 leagues S.E.
of Auxerre.—Allo, a town of France, in the department of
the Marne, and in the district of Reims; 1 league N.W.
of Reims.

BRICHERASCO, a town of Piedmont, in the district
of the Four Valleys; 2 3/4 miles S.S.W. of Pignolo.

BRICIANI, Knights of St. Bridget, a military order,
refembling that of Malta, established by St. Bridget, princi-
cipal of Sweden, in 1566, and approved of by pope Urban V.
who gave it the rule of St. Augustin. The arms of the
Briciani were a croos azure, like that of the knights of
Malta; under which was a tongue of fire, to express the
ardour of their zeal: their office was to fight against heres-
ics, bury the dead, assist widows and orphans, &c.

BRICK, a kind of factitious stone, composed of an argil-
aceous earth, tempered and formed in moulds, dried in the
sun, or burnt in kilns.

The use of bricks is of the highest antiquity. The earliest
buildings of Asia were of bricks, dried in the sun, and ce-
mented with bitumen. In this manner, we learn from the
historical books of the Old Testament, Nineveh was built by
Nimrod; and the famous walls of Babylon, reckoned by the
Greeks among the wonders of the world, were of the same
materials.

Unburnt bricks were used in Egypt: the making of
them was one of the oppressions to which the Israelites
were subjected during their servitude in that country. The
ancient edifices which stands now exist in Egypt are principally
of stone: however, Pococke describes a pyramid of unburnt
brick, called Kloube-el-Menfihieh (the bricks of Men-
fiheh), from a village near, called Menfiheh-Dalhoun.
It was doubtless built near the plain, on account of the bricks,
which seem to be made of the earth brought by the Nile,
being a black sandy earth, with some pebbles and thells in
it. It is mixed up with chopped straw, in order to bind the
clay together; as they now make unburnt bricks in Egypt,
and many other eastern parts, which they use very much in
their buildings. I found some of these bricks 13 1/4 inches
long, 6 1/2 inches broad, and 4 inches thick; and others
8 3/4 inches long, 7 inches broad, and 4 1/2 inches thick. I
observed on the north side the bricks were laid lengthways
from north to south, but not every where in that direction;
however, I particularly took notice that they were not laid
so as to bind one another. It is much crumbled and ruined,
but as it is I measured it, and found it to be 177 feet on the
north side, and 210 feet on the west side; it is 150 feet high.
By what I could judge, from the present slope of it, I con-
cluded that it was built with five degrees, like the pyramid
of Saccara, each being about 10 feet broad and 30 deep,
so that the ascent to it is easy, as the bricks are crumbled
away.”

The Greeks and Romans also used this material, both fum-
dried and burnt. Vitruvius infuses several celebrated
buildings, as the walls of Athens; the cells of the temples
of Jupiter and Hercules, which were of brick, the surrounding
columns and entablature being of stone; the ancient walls
of Arezzo in Italy; the house built by the Attic kings at
Tralles, which was always given for the labitation of those
who bore the office of pricks in that city. The paintings
which were brought from Lacedaemon to ornament the
Comitium, in the edifice of Varro and Marcia, were cut
out of walls of brick; the house of Crenus at Sardis; and
the celebrated tomb of Maunolus, in which, though the
ornaments were all of Proconnesian marble, the walls
were built of brick, and (says Vitruvius) remain to this time
exceedingly sublimitalient; and the incrustation appears as polished
and shining as glass.

The following directions for making unburnt bricks are
given by Vitruvius. They should not be made of sandy,
flinty, or gravelly loam, for such kind of earth renders them
heavy; and upon being wetted with rain after being laid in
the wall, they swell and dissolve, and the straw which is put
in them does not adhere on account of their roughness:
the earth of which they are formed should be light chalky
white or red. They should be made in spring or autumn,
and being the best time for drying; for the intense heat of
summer parches the outside before the inside is dry, which
afterwards drying in the building, causes them to shrink and
break. They are built when made two years before they are
used, as they cannot be sufficiently dry in less time. If
they are used when newly made and moist, the plaster
work which is laid on them remaining firm and stiff, and they
shrinking, and consequently not preferring the same height
with the incrustation, it is, by such contraction, lounfened
and separated.
BRICK.

The baked bricks are made of two parts of earth and one of cinders, well tempered together, in moulds larger than for the others. They leave them to dry in the sun for several days, then place them in a large furnace, ranged over the other, and some distance, which they fill with platter. They close the furnace and light the fire, which is kept up for three days and nights.

Bricks have several advantages over stone as building materials. From their porous structure they unite better with the cement used; they are lighter than stone, and not subject to attract damp and moisture.

The earth proper for the manufacture of bricks is a clayey loam, neither abounding too much in sand, which renders the ware heavy and brittle, nor with too large a proportion of argillaceous matter, which causes it to shrink and crack in drying.

The general process of the manufacture is as follows: The earth should be dug in the autumn; it should lie during the whole of the winter exposed to the frost, as the action of the air, in penetrating and dividing the particles of the earth, facilitates the subsequeunt operations of mixing and tempering. During this time the earth should be repeatedly turned and worked with the spade. In the spring the clay is broken in pieces, and thrown into shallow pits, where it is watered and suffered to remain soaking for several days. The next step is that of tempering the clay, which is generally performed by the treading of men or oxen. In the neighborhood of London, however, this operation is performed by means of a horse-mill. The tempering of the clay is the most laborious part of the process, and that on which the perfection of the manufacture essentially depends. It is to neglect in this part, that we are chiefly to attribute the bad quality of modern bricks, in comparison with the ancient. All the flumes should be removed, and the clay brought to a perfectly homogeneous state, using the least possible quantity of water.

The following experiment, made by M. Gallon, merits attention. He took a certain quantity of the earth, prepared for the making of bricks; he let it remain for seven hours, then caused it to be moulded and beaten during the space of thirty minutes: the next morning the same operation was repeated, and the earth was beaten for thirty minutes; in the afternoon it was again beaten for fifteen minutes. Thus this earth had only been worked for an hour and a quarter longer than usual, but at three different times. The material had acquired a greater density by this preparation; for a brick made with this earth weighed five pounds eleven ounces, while another brick, made in the same mould, of the earth that had not received this preparation, weighed only five pounds seven ounces. Then having dried these bricks in the air, during the space of thirteen days, and having burnt them along with others, without any particular precautions, they were examined when taken from the kiln, and it was found that the bricks made of the earth which had been the most worked still weighed four ounces more than the others, each having lost five ounces by the evaporation of the moisture. But their strength was very different; for on placing them with the centre on a sharp edge, and loading the two ends, the bricks formed with the well-tempered earth, were broken with a weight at each end of 65 pounds or 150 pounds in all, while the others were broken with 35 pounds at each end, or 70 pounds in the whole.

The earth, being sufficiently prepared in the pits, is brought to the trench of the moulder, who works the clay into the brick-moulds, and strikes off the superfluous earth. The bricks are delivered from the mould and ranged on the ground; and when they have acquired a sufficient hardness
to admit of handling, they are dressed with a knife, and flaked or built up in long dwarf walls, and thatched over, where they remain dry.

The burning of bricks, which is the next operation, is performed either in a kiln or a clamp. In the former, the bricks being let in, and the kiln covered with pieces of brick, they put in wood to dry them with a gentle fire; and this they continue till they are pretty dry, which is known by the smoke turning from a whitish to a thin black smoke. They then cafe to put in wood, and proceed to burn with brush, furze, thraw, brake, or fern faggots, having first closed up the mouth of the kiln with a thin fog (pieces of brick piled upon one another and closed with wet brick earth instead of mortar), then they continue to put in more faggots till the kiln and its arches look white, and the fire appears at the top, upon which they slacken the fire for an hour or two, and let all cool by degrees. Thus they continue alternately heating and facking, till the ware be thoroughly burnt, which is usually effected in 48 hours.

About London they burn in clamps, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick's breadth, for the fire to play through; but with this difference, that, instead of arching, they gather the ashes over by making the bricks project over one another. The place for the fuel is carried up straight on both sides till about three feet high; they then nearly fill it with wood, and over that lay a stratum of sea coal, and then overspan the arch; sea-coal is also threw between every row of bricks in the clamp; lastly, they kindle the wood which communicates with the coals; and when all is burnt out, they conclude that the bricks are sufficiently burnt.

The proper burning of bricks is a matter of considerable difficulty, and requires an experienced workman; as it is necessary to maintain an equal heat throughout the whole mass, neither too little, which would leave the bricks weak and crumbly, nor too great, which would cause them to run together into a vitrified flag. This operation is much better performed in kilns than in clamps, as the fire can be kept up and regulated at discretion; while in clamps, as the whole of the fuel must be put in at once, the manufacturer is always tempted to use too little, and the outside bricks are necessarily under-burnt. These are called fame bricks, and are sold at an inferior price.

The legislature has often interfered to regulate the manufacture of bricks. By flat. 12 Geo. 1. cap. 35, earth or clay, designed for making bricks for sale, shall be dug and turned at least once between the 1st of November and the 1st of February, and not be made into bricks till after the 1st of March, and no bricks be made for sale but between the 1st of March and 20th of September. But by flat. 10 Geo. III. cap. 49, earth may be dug for making bricks at any time in the year, provided such earth be turned once before it be made into bricks, and by the former statute, no Spanish is to be mixed with the earth or breeze used in the burning of bricks; and all bricks are to be burnt either in kilns, or different clamps, each fort by itself.

By flat. 3 Geo. II. cap. 22, there may be mixed with the brick-earth any quantity of sea-coal ashes, sifted or fcreened through a sieve or screen half an inch wide, and not exceeding 20 loads, to the making of 100,000 bricks, each load not exceeding 36 buhlets. And breeze may be mixed with coal in the burning of bricks in clamps for sale, &c. Stock-bricks and place-bricks may be burnt in one and the same clamp, so that the flock bricks be let in one distinct parcel, and not mixed and surrounded with place-bricks.

For the more effectually securing the observation of these laws, it was enacted, by 12 Geo. I. cap. 55, for the better discovery of offenders, that the master and wardens of the company of tilers and bricklayers should have power to search brick-kilns, &c.; but they having permitted, and even encouraged divers persons to make bricks contrary to the directions in the said act, by 2 Geo. II. cap. 15, they are divelld of that power, and any two, three, or more persons, appointed by the justices of peace, are empowered, within 15 miles of London, to go in the day-time into any grounds, sheds, or places where any clay or earth shall be dugged or digging for bricks or pan-tiles, or any bricks or pan-tiles shall be making or made for sale, and there to view, search, and inspect the same, &c. Offenders to forfeit 66 shillings for every thousand of inflammable bricks, and 10 shillings for every thousand of such tiles; one moiety to the use of the professor, the other to the poor of the parish where the offence shall be committed.

By 17 Geo. III. cap. 42, all bricks made for sale shall, when burnt, be not less than 3½ inches long, 2½ thick, and 4 wide.

By 43 Geo. III. c. 69, (consolidating the excise duties) passed July 4, 1803, every thousand of bricks made in Great Britain, not exceeding 10 inches long, 3 inches thick, and 5 inches wide, is liable to a duty of 5s. and exceeding the fore-mentioned dimensions to 10s.; and every thousand of bricks made in Great Britain, and smoothen or polished on one or more sides, not exceeding the superficial dimensions of 10 inches long by 5 inches wide, is subject to a duty of 12s. and if such bricks exceed these dimensions, to the duty on paving tiles. The said duties are to be paid by the makers. An additional duty of 1d. per thousand was imposed on bricks and tiles in the ways and means for the year 1805.

The different kinds of bricks made in this country are principally place bricks, grey and red flocks, marle facing bricks, and cutting bricks. The place-bricks and flocks are used in common walling. The marles are made in the neighbourhood of London, and used in the outside of building; these are very beautiful bricks, of a fine yellow colour, hard, and well burnt, and in every respect superior to the flocks. The finest kind of marble and red bricks are called cutting bricks, they are used in the arches over windows and doors, being rubbed to a centre and gauged to a height. There is also a fine kind of white bricks made near Ipswich, which are used for facing, and sometimes brought to London for that purpose. The Windsor bricks, or fire-bricks, which are made at Hedgerley, a village near Windsor, are red bricks, containing a very large proportion of sand; these are used for coating furnaces, and lining the ovens of glasshouses, where they stand the utmost fury of the fire. Dutch clinkers are also imported, long narrow bricks, of a brimstone colour, very hard and well burnt; they are frequently warped, and appear almost vitrified by the heat. The use of them is for paving yards and flables.

**BRICK.**

**BRICK-walls.** See WALL.

**BRICKS, Oil of.** See OIL OF OLIVES.

**BRICK-dust.** It is a custom with some persons to reduce this substance to a very fine powder, and give it, instead of chalk, in the heart-burn. Many of the lozenges, so much famed for the cure of this disorder, and sold under the pome- rous name of coral lozenges, are only made of a mixture of this uncoothe medicine, and sugar, made into the confluence of pattle, with gum tragacanth reduced to a mucilage with rose-water.

**BRICK** is also used in speaking of divers other matters made in the form of bricks.

In which sense, we lay a penny-brick, or brick-bread. Some also mention brick-tin, a sort of tin in that shape brought
BRICKLAYERS, two brothers, who appear to have made their travels serve to the improvement of natural history. The elder published "A natural and political History of Portugal," Svo. Lon-

BRICON, a town of France, in the department of the Upper Marne, and district of Chaumont; 7 miles W. of Chaumont.

BRICZANTI, a town of European Turkey, in the province of Moldavia; 30 miles S. E. of Cokzin.

BRIDE, a woman just married, or a wife in the first days of her matrimonial state. See Marriage.

Among the Greeks, the bride was usually conveyed in a chariot from her father's house to that of her husband in the evening, as the most convenient time for concealing her blushing; she was placed in the middle, her husband sat on one side, and his intimate friend on the other; torches were carried before her, and in the procession they sometimes accompanied by fingers and dancers. When they arrived at the end of their journey, the axe-tree of the carriage was broken, signifying, by this action, that the bride was never to return to her father's house. The day on which the bride left her father's house was celebrated as a festival, distinct from the nuptial solemnity; which was kept at the house of the bridegroom, and began in the evening, at the time of the bride's arrival. A banquet was prepared for her reception, from respect due to the gods of marriage, who had been previously invoked, and that the marriage might be made public, as it was usually attended by a concourse of friends. Before the bride was conducted to the marriage-bed, which was richly adorned, according to the quality of the person, she bathed her feet in water, which the Athenians fetched from the fountain "Callirrhoe," afterwards called Ennomos, from nine cisterns, supplied by it with water; which water was brought by a boy nearly allied to one of the married pair. The bride was then lighted to bed with several torches, round one of which the married person's mother tied her hairlace, taken from her head for this use, to which custom Seneca alludes, Theb. v. 525. Whilt the married couple were shut together in a chamber, the laws of Athens obliged them to eat a quince, thus intimating that their first conversation ought to be mutually agreeable; and then the husband proceeded to looke his bride's girdle, called ζωρ; during which time the young men and maidens stood without the door dancing and singing songs, called τιτανίαι, epithalamia. In the morning they returned again, and sang other epithalamia. See APOLLO and ASCALAPIOS.

Among the Romans, the maid espoused remained a bride, ζωρ, till she entered the husband's house; from which time she commenced a wife, uxor.

The bridegroom was attended by a bridesman, paranymphus; the bride by a pronaia, or bridesmaid, whose business it was to instruct her young maids-in-the-duties of the genial bed, and to prepare every thing for a prosperous copulation.

The ancient ceremonies prattled in respect of a bride were numerous; most of them emblematical, or significant of some part of her duty; as, dressing her hair after a peculiar manner, and parting it with a spear; putting on her a crown; girding her with a girdle, which the bridegroom was to loosen; putting a yoke on her neck; dressing her in yellow locks;
feet; and veiling her with the flammum. She was to seem to be ravished or torn by force from her mother, in memory of the rape of the Sabines under Romulus; she was to be carried home in the night-time to the bridegroom's house, accompanied by three boys, called patrinus and matrinus, one of whom carried a torch, and the other two, called para- nympha, led the bride, a spindle and a distaff being carried with her: the brought three pieces of money, called offer, in her hand to the bridegroom, whose doors, on this occasion, were adorned with flowers and branches of trees: being here interrogated who she was, she was to answer, Cina, in memory of Cina Cucilia, wife of Tarquin the Elder, who was an excellent honifius, or spintrix; for the like reason, before her entrance, she lined the door-polls with wool and smeared them with grease.

Fire and water being set on the threshold, she touched both; but fleeing back from the door, refused to enter, till at length she passed the threshold, being careful to step over, without touching it: here the keys were given her; a nuptial supper was prepared for her, and minstrels to divert her; she was lected on the figure of a Priscus, and here the patrinus and matrinus invested her to the presence, who brought her into the nuptial chamber, and put her into the genital bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity. When the bridegroom was brought to her, epithalamia were sung by the women, who were divided for that purpose into two bands, one wherever sung in the evening, the other next morning; and, for the like purpose, nuts were also thrown down for the boys to scramble for. Potter Arch. lib. iv. cap. 11. tom. ii. Vol. 10. Hist. Quaest. Rom. 30. Serv. ad Aen. lib. iv. ver. 430. Kenn. Rom. Ant. p. 8. lib. i. c. 6. Fabr. Bibl. Ant. cap. 10. § 3.

Bride, in Geography, the name of a river in Ireland, which rives in the Nangle mountains, county of Cork, and having passed near the towns of Rathcomack and Tallow, from the latter of which it is navigable, joins the Blackwater about 8 miles above Yonghall.

Bride, in Etymology, a French name of the fifth called by Linnaeus Chaetonotus effusus, which see. Spars effusus of Linnaeus also bears this name among the French.

Bride's bay, St. in Geography, a bay of St. George's channel, on the west coast of the county of Pembroke, in South Wales, having good anchorage in 7 to 10 fathoms; but as the wetherly winds cause a great sea, in the mouth of the bay, the island of Ramsey affords shelter. This island is its northern limit, and Scamourne is its southern point; and on the north of the bay is the city of St. David's. N. lat. 51° 48'. W. long. 5° 27'. In spring tides it has high water at 3 o'clock.

BRIDEGROOM, the spouse or mate of a bride.

Among the Spartans, the bridegroom, as we are informed by Plutarch, in his "Lycurgus," (Op. i. p. 43. ed. Xylander.) committed a kind of rape on his bride. After the preliminaries of marriage were settled, the woman, that conducted the bridal, shaved off the bride's hair close to her skin, defiled her in man's clothes, and left her upon a matress; whilst she in this state, the bridegroom stole privately into the room, united her virgin griddle, and took her into his embraces; and after a short interval, he returned to his companion, with whom he continued to spend his life, remaining with them by night as well as by day, unless he bore a short visit to his bride; which he had no opportunity of doing without great circumstancis, and fear of being discovered.

Vol. V.

Among the Romans, the bridegroom was decked to receive his bride; his hair was combed and cut in a peculiar form; he had a coronet or chaplet on his head, and was dressed in a white garment. Pittic. Lex. Ant. tom. i.

By the ancient canons, the bridegroom was to forbear the enjoyment of his bride the first night, in honour of the nuptial benediction given by the priest on that day. John. Eccles. Law. tom. 740. § 88.

In Scotland, and perhaps also some parts of England, a custom called marchet, obtained, by which the lord of the manor was entitled to the first night's habitation with his tenants' brides. See Borough English, and Marchet.

BRIDEMIL, in the Persian Tables, the constellations Lyres, or the Wolf.

BRIDEWELL, in our Cysis, denotes a work-house, partly for the correction of vagrants and disorderly persons, and partly for the employment of the parfit poor.

They are supplied during their abode here with clothing and diet; and those who are committed for correction are not only made to work, but, according to their crimes, they receive occasionally a number of drapes as the governor of the house of correction ordains.

Bridewell, near Fleet-Street, is a foundation of a mixt and singular nature, partaking of the hospital, the prison, and work-house; it was founded in 1553, by Edward VI. who gave the place, where King John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 marks of land, bedding, and other furniture. Several youths are sent to this hospital as apprentices to manufacturers, who reside there; they are clothed in blue doublets and breeches, with white hats. Having faithfully served their time of seven years, they have their freedom, and a donation of ten pounds each, for carrying on their respective trades.

BRIDGE, in Architecture, from the Saxon byne, is a structure of carpentry, masonry, or iron-work, built over a river, canal, or valley, for the convenience of passing from one side to the other, and may be considered as a road supported in the air by arches or lintels, and these again supported by proper piers or buttments.

Bridges generally form the continuation either of an highway or of a street; in the first case they are frequently built in a rude and cheap manner, and too often without proper attention to those principles which would ensure permanence and solidity to the structure; but when they take their lead or direction from a principal street in a capital city, their construction is attended with great expense, and a degree of elegance and durability is required in their formation, which calls for the utmost judgment and skill in the architect. The magnitude of bridges also varies with their situation. When they are erected in places not much frequented, they are often, without any impromptu, made about eight or ten yards wide, but the breadth of a bridge for a great city should at least be such as to allow a safe and easy passage for three carriages, and two horsemen abreast, and for three or four foot passengers in the same manner on each footway.

A lately bridge over a large and rapid river, while it is one of the most difficult, is justly esteemed one of the most noble and striking specims of human art. To behold grand arches compoited of an immense quantity of small material, so disposed and united together as to form one compacted body, which, beleth the dream, affords above an ample communication with the distant shores, and allows below an uninterrupted passage to navigation, is enough to awaken the admiration of every spectator. The art of bridge building, accordingly, has received considerable attention from writers on architecture, the earl of whom is Alberti, who has...

B R I D G E.

TheRomansdiscovered, in this respect, a more solid manner of thinking; they were, it is true, much attached to pomp, but they never neglected works of public utility: they never risked their lives unnecessarily in crossing a torrent, as the Athenians must have done previous to the arrival of the emperor Adrian; for it was Adrian who undertook to form, by a bridge, a safe communication across the Cephissus, between the territories of Attica and Elenis, on the most frequented road of Greece. While, therefore, we ascribe to the Greeks the use of arches and vaults, properly constructed for covering various openings in their buildings, we must look to the Romans for the application of arches to bridges, and for the chief improvements in those useful structures.

The construction of the Roman bridges is best described by Bergier: they possessed all the requisites which are met with in a modern bridge; they consisted of pile, or piers, foundations, or arches, flablers, or butments, puentes, and anges, the roads over in the middle for carriages, on each side of which were decursores, or banquettes, somewhat higher than the rest of the road for foot passengers, and separated from it by a pons, or railing, and sometimes even covered over to shelter passengers from the rain, as in the Ponts d'Abis. Among the Romans, the building and repairing of bridges was first committed to the priests, thence named pontifices, then to the censors and curators of the roads, and finally, the emperors took the care of the bridges into their own hands.

The ancient bridges of Rome were eight in number. The bridge of Fabricius, which joins the island of the Tyber to the city; it is now called Ponte Quattro Capi, from the four heads of Janus, which are placed upon it. The bridge of Cepius, now called of Sain Bartolomé, which descends from the other side of the island piers to the Tiber-Tevere. The fifth bridge built at Rome, which was of wood, and thence called Pont Sublicius, was afterwards rebuilt of stone by Emilius Lepidus;
The celebrated Roman bridge Pont, St. Esprit, near Lyons, has long been reckoned one of the most bold and beautiful of the ancient bridges in France. Its whole length is upwards of 800 yards; it is very crooked, bending in many places, and making several unequal angles, especially in those parts where the Rhone has the strongest current. The arches are from 15 to 20 fathoms wide, and have their feet, or the bottoms of the piers, protected by two pendentives which project from them; the lower part of the piers consists of several courses of footings jutting out like steps. Between the great arches there are smaller arches like windows that come down nearly to the top of the pendentives, about the middle of the pier. This mode of construction was adopted with a view of breaking gradually the mighty force of the Rhone, the several courses of steps jutting out from the piers were intended to oppose and break the stream by portions, and prevent it from coming with its whole force at once upon the fabric; and when the flood should rise too high to cover the steps and pendentives, then the small window-like arches would assist to convey the water through, which might otherwise endanger the great arches.

The bridge of Brioude is of great antiquity, and very remarkable, as the largest stone arch with which we are acquainted. This bridge has only one arch, under which passes the whole stream of the river Allier. The arch is formed of two ranks of squared stones; all the rest of the fabric is of rubble work. The two extremities of the arch are founded upon the rock, which occasions the springing on one side to be higher than on the other; its span is 181 feet, and its greatest height from the water to the summit is 68 feet 8 inches, and the width of the bridge between the parapets is 13 feet.

In the middle ages bridge building was reckoned among the acts of religion; and a regular order of hospitallers was founded by St. Benezet, towards the close of the 12th century, under the denomination of pontifices or bridge-builders, whose office was to assist travellers by making bridges, letting ferries, and receiving strangers in hospitals or hospices built on the banks of rivers. We read of a hospital of this kind at Avignon, where the hospitallers dwelt under the direction of their first superior St. Benezet. The Jesuit Raynal has a treatise expressly on St. John the bridge-builder.

The bridge of Avignon was begun in the year 1176, and finished in 1188; it consists of 18 arches, and was about 1000 yards in length. Several of its arches have been destroyed by the rapidity of the current together with the force of the ice.

Over the several canals at Venice are laid nearly 500 bridges of different sizes; the greater number of them are of stone. The chief of these, called the Rialto, is celebrated as a master-piece of art: it consists of one flat and bold arch, nearly 100 feet span, and only 23 feet high above the water, and was built in 1588 to 1591, after a design of Michael Angelo. The breadth of the bridge, which is 45 feet, is divided by two rows of shops into three narrow streets, that in the middle being the widest; and there is in the centre an open archway, by which the three streets communicate with one another. At each end of the Rialto is an alcove of 56 steps; the view from its summit is very lively and magnificent. The whole exterior of the shops and the bridge is of marble. The foundation extends 90 feet, and rests upon 12,000 elm piles. This structure cost the republic 250,000 ducaus.

The aqueduct bridge of Acantara, near the city of Lisbon, is one of the most magnificent works of the kind ever executed. It was begun in the reign of John V. king of Portugal.
BRIDGE.

Portuguese, in the year 1711, and finished the 6th of August 1714. The architect, under whose inspection it was begun and finished, was the brigadier M. António de Abreu. The stream which passes through this duct, for the use of the inhabitants of the city of Lisbon and its suburbs, has an average depth of 9 feet, a width of 21 feet, and a fall of 1 foot from Lisbon to the spring, near the Ribeira de Caracol, equal to 32 feet. The stream is a wide, shallow, slow, and beautiful free-fall. The building is continued the same height, width and depth of the aqueduct from Lisbon to the spring, near the Ribeira de Caracol, so that if by accident any part becomes out of repair, the workmen have easy access to it. The subterranean passages are lighted and ventilated by frequent openings made from the surface of the earth into the aqueduct; and over each of these openings there are square towers erected, which have windows lattice, with iron bars to admit the light and air, and at the same time to prevent mischief from throwing anything into the building to injure it.

This pile is lighted and ventilated by 79 windows and 16 turrets; the former are three feet seven inches long by 13 inches wide, railed with iron and lattice with bars; the latter are 23 feet six inches above the roof, and are 16 feet square; beneath every second turret is an arched door-way into the aqueduct on each side of the building, wherein the water flows, and between that building and a parapet wall is a foot path leading from Lisbon towards the very pleasant village of Bemfica, about four miles from Lisbon, where several gentlemen have their quinta or country-estates; one in particular, the quinta of M. António de Abreu, is a perfect palace enchanté, with its lovely fountains, beautiful gardens, fine ponds, and fountains, and sportive fountains, are frequently honoured with visits by the queen and royal family.

The water channel under the grand arch is about 24 feet wide and seven feet deep, but, except in very rainy seasons, no water pales through this channel; the small running stream constantly passing through the valley of Alcancara is conveyed by a very narrow channel under the pavement through the grand arch, and then continues its course through the valley, in a stream between two and three feet wide, till it empties itself into the Tagus at Alcancara bridge, about the distance of two miles from the aqueduct. The expense attending the execution of this magnificent work, and keeping the same in repair, has been immense, yet the small tax of a single rei on every pound of meat, raises a fund sufficient for the purpose. There is a chapel seen through the eleventh arch, dedicated to Nossa Senhora dos Terremotos, our Lady of the Earthquakes; in commemoration of that dreadful event the earthquake in 1755, when the greatest part of the city of Lisbon, with most of her stately buildings, and magnificent temples, were levelled with the ground.

The height of the grand arch is 227 feet, and the total length of the piers and arches 2494 feet.

Several of the bridges in France are remarkable for their size and boldness of construction, among which may be mentioned the bridge of Neufly, built by M. Perronet, over the Seine, on the alignment of the great avenue of the Champs Elysées, in front of the palace of the Tuileries. This bridge, which is level at top, consists of five equal arches of 120 feet French (128 feet English) in span, and 30 feet French (32 feet English) rise. The arches are oval, composed of 11 arcs of circles of different diameters; thus the upper portion of the arch was formed with a circle of 160 feet radius, which, by its settlement during the building, and after the filling of the centres, was flattened, till it became an arc of a circle of 250 feet radius, differing so little from a straight line, that, as Perronet observes, the rife of the curve, in a length of 35 feet, amounted only to 6 inches 9 lines. The piers are 24 feet wide, and the breadth of the bridge 48 feet. It was begun in the year 1768, and terminated in 1780.

The bridge on the Seine, at Montreuil, consists of three arches, the middle one having an opening of 120 feet French (128 feet English), and the two outside 108 feet French (116 feet English); the piers being 25 feet 6 inches wide, and the abutments 29 feet. This structure was begun by M. Hupcau in 1757, and completed by Perronet.

The bridge of Pont-Sainte-Maixenne, on the river Oise, on the great road from Paris into Flanders, is also a work of Perronet's. This bridge, which is 41 feet wide, has three arches of 27 feet opening each, being a segment of a circle described with a radius of 118 feet. Each pier is simply composed of four cylindrical pillars 9 feet diameter, leaving, therefore, three spaces or intercolumniations between them, which are arched over, the two external ones closed with a thin walling, and the middle one left open.

The bridge over the Loire, at Orleans, is composed of nine arches, which spring at 12 inches above low water; the middle arch is 160 feet in span, with a rise of 30 feet; the two arches at the extremities being 98 feet wide and 26 feet high, and the others in proportion; the four middle piers 19 feet, the four others 18 feet, and the abutments 23 feet 6 inches thick, making the whole length 1100 feet; the arches are oval, described from three centres. This bridge was built by M. Hupcau, begun in 1750, and finished in 1760. We
BRIDGE.

We have many bridges of considerable note in our own country. The triangular bridge at Croyland in Lincolnshire, which was erected about the year 865, is said to be the most ancient Gothic structure remaining entire in the kingdom. There are two circumstances in the construction of this bridge, which render it an object of great curiosity. First, it is formed by three semi-arches, whose bases stand in the circumference of a circle, at equal distances from each other. This unite at the top, and the triangular nature of the structure has led some to imagine that it was intended as an emblem of the Trinity. Secondly, the arches on each of the semi-arches is by feet paved with small stones, edge-ways, and is so deep, that none but foot-passengers can go over the bridge; horsemen and carriages frequently pass under it, as the river in that place is shallow. For what purpose this bridge was really designed, it is difficult, if not impossible, to determine. Utility, it is obvious, was one of the chief motives to its erection.

To holders of design and ingenuity of construction it has more powerful claims; and these qualities it must be allowed to possess in as great a degree as any bridge in Europe. Although this bridge has been erected so many centuries, it exhibits no marks of age. Twelve monuments there were no fixtures to be perceived in either of the arches, and all that was milled were a mound and sypsetre, which have been taken from the hands of a Rake of King Ethelbert by the ruthless hand of time.

London Bridge is in the old Gothic style, and had twenty small lack or arches, but there are now only 16 open, two having lately been thrown into one in the centre. It is 540 feet long, 44 high, and 44 clear width between the piers. The piers are from 15 to 15 feet thick, with flerings projecting at each side and end, so that the greatest water-way, where the tide is above the flerings, is 245 feet, scarcely half the breadth of the river; and below the flerings the water-way is reduced to 204 feet, causing a dangerous fall at low water. London Bridge was first built with timber in the reign of Ethelred, between the years 993 and 1016; it was repaired, or rather rebuilt of timber in 1463, and the present stone bridge was begun under King Henry II. in 1176, and finished under King John in the year 1207. It is probable there were no houses on the bridge for upwards of 200 years, since we read of a tilt and tournament held on it in 1595. Houses were erected upon it afterwards, and being found a great inconvenience and nuisance, they were removed in 1753, and the avenues to the bridge enlarged, and the whole made more commodious: the two middle arches were then thrown into one, by removing the pier from between them. The expense of the repairs amounted to above 80,000l.

There were other bridges in England built in the manner of London bridge; as the bridge at Rochester, which is 570 feet long, and has 11 arches; also the late bridge at Newcastle upon Tyne, which was broken down by a great flood in the year 1771, for want of a sufficient space for water-way through the arches. The longest bridge in England is that over the Trent at Burton, built by Bernard abbot of Burton, in the 13th century. It is all of iron and brick, and is strong and lofty, 1545 feet in length, and consisting of 34 arches.

The bridge at Blenheim consists of three arches, the chief of which spans 101 feet 6 inches.

Near Old Aberdeen there is a bridge over the river Don, very much celebrated. It is in the Gothic style. There is also a remarkable bridge called Sarah or Snad bridge, built over the Liffey above Dublin, in the year 1792, by Mr. Alexander Stevens, a mason from Edinburgh; it consists of a single elliptical arch 185 feet span, and only rising 22 feet; it is therefore six feet wider than the Rialto at Venice, and one foot less in height.

But the most extraordinary bridge in Great Britain is, doubtless, that over the river Taff, near Llanfair, in Glamorganshire, called in Welsh Pont y 15 Prydydd. This is the work of William Edwards, an uneducated mason of the country, who was only indebted for his skill in his own industry and the power of his genius. He had engaged, in 1735, to build a new bridge at this place, which he executed in a style superior to any thing of the kind in any part of Wales, for neatness of workmanship, and the elegance of design, as well as the improvement of the light in its construction.

The four foundations were excellently well dressed and closely jointed. It was admired by all who saw it. But this river runs through a very deep vale that is more than usual woody and crowded about with mountains. It is also to be considered, that many other rivers of no mean capacity, as the Crue, the Bargood Taff, and the Conno, besides almost numberless brooks that run through long, deep, and well-wooded vales or glens, fall into the Taff in its progress. The torrents into these vales from the mountains being in general very steep, the water in long and heavy rains, collects into these rivers with great rapidity and force, raising floods, that in their descriptions would appear absolutely incredible to the inhabitants of open and flat countries, where the rivers are neither so precipitate in their courses, nor have such hills on each side to swell them with their torrents. Such a flood unfortunately occurred after the completion of this undertaking, which tore up the largest trees by the roots, and carried them down the river to the bridge, where the arches were not sufficiently wide to admit of their passage. Here, therefore, they were detained. Brothwood, weeds, hay, straw, and whatever lay in the way of the flood, came down, and collected about the branches of the trees, that stuck fast in the arches and choked the free current of the water. In consequence of this obstruction to the flood, a thick and strong dam, as it were, was thus formed. The aggregate of so many collected streams being unable to get away, fell here to a prodigious height, and, with the force of its prelude, carried the bridge entirely away before it.

William Edwards had given security for the safety of the bridge during the space of seven years; of course he was obliged to erect another, and he proceeded on his duty with all possible speed. The bridge had only stood about two years and a half. The second bridge was of one arch, for the purpose of admitting freely under it whatever impediments the floods might bring down. The span or chord of this arch was 140 feet, its altitude 35 feet, the segment of a circle whose diameter was 170 feet. The arch was finished, but the spandrels not yet erected, when such was the pressure of the unavoidable ponderous work over the hauntches, that it swelling in the middle, and the key-flous were forced out. This was a severe blow to a man who had hitherto met with nothing but misfortune in an enterprise which was to establish or ruin him in his profession. William Edwards, however, policed a courage which did not easily forsake him; he engaged in it a third time, and by means of cylindrical holes through the hauntches, reduced their weight, that there was no longer any danger from it. The second bridge fell in 1751; the third, which has flood ever since, was completed in 1755. (Mr. Maltkin's Torn in South Wales.) The prefent arch is 140 feet in span, and 35 feet high, being a segment of a circle of 175 diameter. In each haunch there are three cylindrical openings running through from side to side; the diameter of the Lowell is nine feet, of the next six feet, and of the uppermost three feet. The width of the bridge is about eleven.
To strengthen it horizontally, it is made wider at the abutments, from which it contracts towards the centre by seven odd feet, so that the road-way is one foot nine inches wider at the extremities than at the middle.

The bridges of Westminster and Blackfriars, over the river Thames at London, are among the finest structures of the kind in Europe. The former is 1250 feet long, and 44 feet wide, having a commodious broad path on each side for passengers. It consists of thirteen large, and two small arches, fourteen intermediate piers and two abutments. The length of each abutment is 76 feet; the opening of each of the smaller arches is 25 feet; the span of the lintel of the larger arches at each end is 52 feet, of the next 56 feet, and so on increasing by four feet at a time to the central arch, the span of which is 76 feet. The two piers of the middle arch are 17 feet wide, and the others decrease equally on each side, by one foot at a time, every pier terminating with a falliant right angle against either stream. The arches are semi-circular, and spring from about the height of two feet above low water. The breadth of the river in this place is about 2250 feet, and the water-way through the bridge amounts to 870 feet. The bridge was begun in 1738, and opened for passengers in 1750, at a nea exitence of £198,300. It is constructed of the best materials, and in a neat and elegant taste; but the arches are too small in proportion to the quantity of masonry.

Blackfriars bridge, nearly opposite to the centre of the city of London, was begun in 1760, and completed in ten years and three quarters, at a near exitence of 152,840l. It is an exceedingly light and elegant structure; but, unfortunately, the materials do not seem to be of the best kind, as many of the stones in the piers are decayed. The bridge consists of nine large, handsome, and nearly elliptical arches; the central arch is 100 feet wide, and the four arches on each side, reckoning towards the shores, decrease gradually, being 98, 93, 83, and 70 feet respectively, leaving a water-way of 785 feet. The whole length from wharf to wharf is 995 feet, the breach of the carriage-way 28 feet, and that of the raised foot-way on each side seven feet. The upper surface of the bridge is a portion of a very large circle, which forms an elegant figure, and admits of convenient passage over it. On each pier there is a recess or balcony, with two Ionic columns and pilasters, which stand on a circular projection of the pier above high water mark. The bridge is rounded off at each extremity to the right and left, in the form of a quadrant of a circle, rendering the access commodious and agreeable. This edifice must be regarded as a fine specimen of Mr. Mylne's ingenuity and judgment, though the method of construction has never been made public.

Besides the bridges already mentioned, there are many other neat and elegant structures in different parts of Great Britain and Ireland. The bridge over the Tees at Wintron in Yorkshire, was designed by Sir Thomas Robinson, and built by John Johnson, a common mason at Waddington, in the year 1752. It consists of a single arch 188 feet 0 inches span: is built of rubble-stone: and cost only 500l. An elegant stone bridge has lately been built over the Tweed at Kelso, upon the plans and under the direction of Mr. John Rennie. This has five elliptical arches of 72 feet span each; is quite level at top. It has twoDONE and pilasters, which stand on a circular projection of the pier, with a simple block cornice. The cost of this bridge was about £13,000.00. exclusive of the roads at each end, which cost about £300.00. more, in all 16,000l.

The bridge over the Peafe, or rather Peeth, on the road from Dunbar to Berwick upon Tweed, is rather an uncommon structure. This bridge crosses a deep ravine called the Peaths. It consists of four semi-circular arches. That at the east side of the ravine is 54 feet span; the second 55 feet; the third 52 feet, and the further or western arch 48 feet. The height of the bridge, from the bottom of the ravine to the surface of the road, is 124 feet. The situation is beautiful, and has a most romantic appearance. It was designed and built by the late Mr. David Henderson, architect in Edinburgh, and does him considerable credit.

The aqueduct bridge, constructed by Mr. Rennie on the river Lune at Lancaster, is one of the most magnificent works of the kind which has been erected for the purposes of navigation. At the place where it is built, the water is deep and the bottom bad. It consists of 5 arches of 70 feet span each, and about 39 feet above the surface of the water. It has a handsome cornice, and every part of it is finished in the best manner. The foundations are laid at the depth of 20 feet under the surface of the water, and stand on a flooring of timber, supported by piles. The foundation alone cost 15,000l. The superstructure cost above twice that sum, although the stone was found within a mile and a half of the place where the aqueduct was built. Barges of 60 tons batter navigate the canal. The total height from the surface of the river to the surface of the canal is 51 feet.

It may be observed in this place, that the Romans always, without any exception that we are acquainted with, made their arches either of a semi-circle, or of a lesser segment of a circle. The vousoirs were generally included between two concentric curves, on which account these are called extradosed arches. The earlier Italian architects followed the example of the Romans in the forms of their arches, which, are either semi-circular, or of a smaller segment, called by them arco intiero, and arco fmeio, from which term our workmen have taken that of fme arco. Elliptical arches are very much used by the engineers of France, most of the bridges in that country being in this manner. The French delight in their arches into three kinds, Pumo plan-ctnere, Pumo farba, and Pumo farba: the first is a semi-circle, the second higher, and the third lower than a semi-circle, being formed by the greater or smaller axis of an ellipse; in practice, however, these are generally composed of several arcs of circles of different diameter, as in this case the joints are more easily traced. The arcs farbais are also called aupe de penier. The arc bombé is an arc farbaise, formed by a segment of a circle.

The ancients always laid their wrought stones without mortar between the joints, frequently using iron cramps to connect them more firmly together. Their large arches, and those which had to bear very great weights, were composed of several ranks of vousoirs extradosed, and breaking joint, as is seen in the great cloaca of Rome, and in several bridges and aqueducts. Modern architects, however, generally use only one rank of vousoirs, each of which is terminated at top by a horizontal joint, and laterally by a perpendicular joint, for the purpose of ranging better with the courses of the haunches and spandrels.

The decoration of bridges ought to be simple and large, their beauty consisting chiefly in the proportion of the voids and solids, the contour of the arches, and apparent strength and solidity, together with boldness of construction. However, many modern architects have carried simplicity to excess, particularly in Paris, where the arches of all the bridges are plain, and without any member of architecture. A happy introduction of rich work of various forms and figures breaks the monotony of the large masses, and enriches the edifice. This method was often employed by the ancients, and we never find that they neglected to ornament the arches of their bridges with archivoltos more or less rich.
Palladio, in all his designs of bridges, has never omitted this
simplest and best decoration of arches. Cornices and bal-
u-lustrades also are both useful and ornamental in these
structures.

Generally speaking, large arches are more expensive than
smaller. In a bridge lately designed over a river, wherein
the foundations were very difficult to construct, one design
with three arches of 116 feet each, was estimated at 13,174.
and another of five arches of the same kind was estimated at
12,941., which was contracted for and built for the
above sum.

Wooden bridges now demand our attention. The simplest
case of these edifices is that in which the road-way is laid
over beams placed horizontally, and supported at each end
by piers or pilings. This method, however, is deficient in
strength and width of opening; it is therefore necessary, in
all works of any magnitude, to apply the principles of
trussing, as used in roofs and of arches. Wooden bridges
of this kind are built of carpentry, in which, by a
proper disposition, beams are put, so as to stand in place of
folds bodies, as large as the spaces which the beams enclose;
and thus, two or three or more of these are set in abutment
with each other, like mighty arches.

Palladio has given several very elegant designs of wooden
bridges, which he thus describes. The bridge of the
Clisson. The Clisson is a river, which, falling from the
mountains that divide Italy from Germany, runs into the
Bretza a little above Belfano. And, because it is very
rapid, and great quantities of timber are sent down it by the
mountaineers, it was resolved to make a bridge there, with-
out fixing any pilings in the water, which were liable to be
held away by the violence of the current, and the shock of
the fomes and trees that continually came down. The
invention of this bridge, (says Palladio,) is, in my opinion,
very worthy of attention, as it may serve on all occasions
where these difficulties may occur, and because that bridges
thus made are strong, beautiful, and commodious; strong,
because all their parts mutually support each other; beauti-
ful, because the texture of the timbers is very agreeable;
and commodious, being even, and in the same line with the
remaining part of the street. The river where this bridge
was erected is 100 feet wide; this width is divided into fix
equal parts; and at the end of each part, except at the
banks, which are strengthened with pilasters of stone, the
beams are placed, that form the breadth of the bridge,
upon which, a little space being left at their ends, were
placed other beams lengthways, which form the fides. Over
these, directly upon the first, the colonelli (king-polls)
were disposed on each side; these king-polls are connected
to the beams which form the breadth of the bridge by
means of iron pins passing through the projecting ends of
the beams, and bolted and pinned through both. See fig. 1,
Plate XXXII. of Architecture.

Palladio proceeds to describe three other methods of con-
structing wooden bridges without pilings in the water, like
the bridge over the Clisson. The bridges after the first
method are to be made in this manner: the banks being
strengthened by pilasters as necessity shall require, one of
the beams forming the breadth of the bridge is to be placed
at some distance from it, then the first sirit is to be placed
with one end upon the pier, and the other end abutting
against the first queen-poll, which is to be connected with
the beams by irons. Then the second beam for the breadth
is to be placed at a distance equal to the space between the
first beam and the pier, which is to be supported in like
manner with a first and queen-poll, and thus proceeding
as far as is required, observing to have a king-poll in the
middle of the length in which the firsts meet both ways,
and with collar beams between all the polls which stiffen
and support the whole construction. Bridges after this
manner are to be wider at the extremities, and contract
wards the middle. See fig. 2, Plate XXXII. of Architecture.

The invention of the following bridge has the upper part
which supports the weight in the form of a polygon, in-
scribed in a flat segment of a circle; the beams forming
the breadth of the road-way are upheld by king-polls and irons,
and the whole stiffened and supported by braces crossing
another between the king-polls. Straits at each end, reach-
ing from the piers to the first beams, are also added to shorten
the bearing, and increase the strength of the fabric. See
fig. 1. Plate XXXIII. of Architecture.

The third design may be made with a greater or smaller
arch than is here represented. The height of the bridge,
in which are placed the braces between the king-polls, or re-
ther radius, is to be an eleventh part of the span. (See fig. 2,
Plate XXXIII., of Architecture.

Mr. Coke, in the first volume of his Travels, has slightly
described a very singular bridge at Wittingen, in Swiefer-
land, the construction of which is quite simple. The span is 200
feet, and it rises only 7. The sketch (fig. 3, Pl. XXXIII.)
will make it sufficiently intelligible. ABC is one of two
great arches approaching to a Catenary shape, built up of
7 courses of solid logs of oak, in lengths of 12 or 14 feet,
and 16 inches or more in thickness. These are all picked of
a natural shape, fitted to the intended curve; so that the
wood is nowhere cut across the grain to trim it into shape.
These logs are laid above each other, so that their abutting
joints are alternate, like those of a brick wall; or, in the
language of the workmen, they break joint. It is indeed a
wooden wall, simply built up by laying the pieces upon each
other, taking care to make the abutting joints as close as
possible. They are not fastened together by pins or bolts,
but held together by iron irons, which surround them at
the distance of five feet from each other, where they are
fastened by bolts and keys. These two arches being erected,
and well built against the rock on each side, were freed
from their supports, and allowed to settle. They are so placed
that the intended road abc intersects them about the middle
of their height. The roadway is supported by crosstjoints,
which rest on a long horizontal timber-beam; and this is
connected with the arches on each side by uprights bolted
into them. The whole is covered with a roof, which pro-
jects over the arches on each side, to defend them from the
weather. Three of the spaces between these uprights have
fruits, or braces, which give the upper work a sort of truf-
ing in that part. This bridge is of a height much more
than adequate to support any load that can be laid upon it;
though it is manifest, by the attempt to truss the ends, that
it was the contrivance of a person ignorant of principle. It
was the work of one Ulrich Grubenham, of Tuffen, in the
canton of Appenzel, a carpenter without education, but
celebrated for several works of the same kind.

At Schaffhaussen, in Swieferland, where the Rhine flows
with great rapidity, several stone bridges had been destroyed,
when, in 1754, Grubenham offered to throw a wooden
bridge of a single arch across the river, which is nearly 520
feet wide. The magistrates, however, required that it should
confist of two arches, and that he should, for that purpose,
employ the middle pier of the bill stone bridges, which would
divide the new one into two unequal arches of 172 and 193
feet splan. The carpenter did so; but continued to leave it
a matter of doubt, whether the bridge is at all supported by
the middle pier. It was erected on a plan nearly similar to
the Wittingen bridge; at the expense of about 8000. Jer-

BRIDGE.
Bridge.

Travellers inform us, that it shook if a man paffed over it; yet waggons heavily laden also went over it without danger. We are forefy to add, that this curious bridge was built by the French when they evacuated Schaffhausen, in April 1796.

Besides the wooden bridge already described, there are several elegant and well constructed edifices in Great Britain: the most eminent of which is that at Walton-upon-Thames. This bridge consists of three wooden arches, and one brick arch at each end; the middle arch was 150 feet in span, with a rise of 28 feet, constructed of three principal ribs, framed in the manner represented in Plate XXXIV. of Modern Architecture. It was the design of the ingenious carpenter, Mr. Etheridge.

Iron Bridges. Iron being the most abundant, cheap, and generally useful of all metals, has of late been employed in many works where great strength was required in proportion to the weight of the material: hence cylinders, beams, and pumps for steam-engines, boats, and barges for canals and navigable rivers, beams and pillars for warehouses and other large buildings, and at length bridges, have been constructed of iron.

Iron bridges are the exclusive invention of British artifices. The first that has been erected on a large scale is that over the river Severn, at Coalbrook Dale, in Shropshire. This bridge is composed of five ribs, and each rib of three concentric arcs connected together by radiating pieces. The interior arc forms a complete semicircle, but the others extend only to the cills under the roadway. These arcs pass through an upright frame of iron at each end, which serves as a guide; and the small space in the branches between the frames and the outer arc is filled in with a ring of about seven feet diameter. Upon the top of the ribs are laid cast iron plates, which fllam the roadway. The arch of this bridge is 150 feet 6 inches in span; the interior ring is cast in two pieces, each piece being about 70 feet in length. It was constructed in the year 1779, by Mr. Abraham Darby, iron-master at Coalbrook Dale, and must be considered as a very bold effort in the first instance of adopting a new material. The total weight of the metal is 770 tons.

The second iron bridge, of which the particulars have come to our knowledge, was that designed by Mr. Thomas Payne, author of many political works. It was constructed by Miers, Walkers at Rotherham, and was brought to London, and set up in a bowling-green at Paddington, where it was exhibited for some time. After which it was intended to have been sent to America; but Mr. Payne not being able to defray the expense, the manufacturers took it back, and the malleable iron was afterwards worked up in the construction of the bridge at Wearmouth.

The third iron bridge of importance erected in Great Britain, was that over the river Wear, at Bishop Wearmouth, near Sunderland, the chief projector of which was Rowland Burdon, esq. M. P. As this is the most considerable structure of the kind, it may be proper to give a brief sketch of its history. In consequence of the increasing trade and population of Sunderland and the two Wearmouths, the ancient ferry, which was almost in the middle of the harbour, had become very insufficient and unsafe; so that, besides frequent delays and disappointments, several instances had occurred of the loss of lives. About the year 1760, in which Mr. Burdon was returned to parliament by the county of Durham, some gentlemen interested in the welfare of the town and neighbourhood of Sunderland, united for the purpose of removing the evil arising from the ferry, and Mr. Burdon was appointed one of the committee. Conceiving at first that a stone bridge would be proper, they began to adopt measures for its erection. An architect was chosen to carry on the necessary works, who in due time produced plans, elevations, and a model of the intended edifice. But as the work was of considerable magnitude and importance, it was thought expedient to refer the design to the opinion of some gentlemen of celebrity for scientific and practical knowledge in and near the metropolis; their report being unfavourable, the scheme of erecting a stone bridge was abandoned. The committee, however, being now warmly engaged in the business, continued to prosecute their inquiries; and Mr. Burdon in particular being frequently called by his parliamentary duty to London, was very diligent in his endeavours to obtain information and hints from various quarters, as to the peculiar advantages and disadvantages of different materials, as well as of various modes of construction. Mr. Burdon had the good fortune to be affiliated in the maturing of his plans by Mr. Thomas Wilson, a truly ingenious man, and at the same time to learn much of the construction of iron bridges from Miers. Walkers, of Rotherham, so that at length he became persuaded that iron would be the most proper material of which to form the proposed bridge. He thought it best, however, to adhere to the ancient construction, by dividing the arch into portions in the manner of arch stones, and taking advantage of the ductility and tenacity of iron to produce an arch of that metal at half fifteen times lighter than a corresponding arch of stone, and capable of being put together upon an ordinary scaffolding, instead of an accurate centre, in a much shorter space of time.

Mr. Wilfon, in conjunction with Miers. Walkers, constructed and set up an experimental arch at Rotherham, which being found to answer expectation, the success of the experiment was communicated by Mr. Burdon to the town of Sunderland and the county; and his proposition for the construction of an iron bridge was accepted. The first stone was laid in September, 1793; and Mr. Wilfon was appointed to the superintendence of the work. The iron-work was cast by Miers. Walkers, of Rotherham, and the arch was turned upon a very light but firm scaffolding, so judiciously constructed that not any interruption was given to the passage of the numerous vessels which navigate the busy river of Sunderland. The mode of bracing the ribs was so simple and expeditious, that the whole was put together and thrown over the river in ten days; the scaffolding was immediately removed, and the bridge opened for general use on the 9th of August, 1796.

During the period occupied in erecting the bridge, Mr. Burdon took out a patent to secure the invention of "a certain mode or manner of making, uniting, and applying cast iron blocks to be sufficed in lieu of key-stones, in the construction of arches." He thus proceeds to describe his invention, which "consists in applying iron or other metallic compositions to the purpose of constructing arches upon the same principle as stone is now employed, by a subdivision into blocks easily portable, answerable to the key-stones of a common arch, which being brought to bear on each other gives them all the firmness of the solid stone arch, whilst, by the great valencies in the blocks, and their respective differences in their lateral position, the arch becomes much lighter than that of stone, and by the tenacity of the metal the parts are so intimately connected that the accurate calculation of the extrados and intrados, so necessary in stone arches of magnitude, is rendered of much less consequence. Fig. 4. Plate XXXIII. of Architecture represents a block of cast iron, five feet in depth from A to A, and four inches in thickness, having three arms B, B, B, and making a part of a circle or ellipse; the middle arm is two feet in length from B to C, and the
the other two are in proportion. On each side of the arms
are grooves (three quarters of an inch deep, and three inches
broad) for the purpose of receiving malleable or bar-iron,
and in each arm are two bolt holes, D. Fig. 2. represents
two of these blocks placed together, and the joints confined
to their respective positions by the bar-iron on each side of
the arms as at E, E, which, with other similar blocks to
united and bearing upon each other, become a rib. Fig. 3.
and F, fig. 2. are hollow tubes six feet long, and four
inches in diameter, having shoulders at each end, with holes
answerable to those of the blocks; G is a block of another
rib connected with the former by the tubes F, E, placed
horizontally. Through the holes in the shoulders and arms
of the block and bar-iron are bolts, fastened with coppers of
forelocks, as at H, H, H, H. The blocks being united
with each other in this, and the ribs connected and supported
laterally by the tubes as above described, the whole becomes
one mass, having the property of key flakes cramped togeth-
er. This extract serves to explain the more minute parts
of the construction: a few words more will describe the
structure itself.

The bridge consists of a single arch, whose span is 216
feet; and as the springing flakes at each side project two feet,
the opening being 210 feet. The arc is a segment of a
circle of about 414 feet diameter, its vered line is 344 feet,
and the whole height from low water about 10 feet, ad-
mitting vessels of from two to three hundred tons breadth
to pass under, without striking their masts. A series of one
hundred and five blocks form a rib, and six of these ribs
comprise the breadth of the bridge. The spandrels, or the
spaces between the arch and the roadway, are filled up by
call-iron arches, which touch the outer circumference of the
arch, and at the same time support the roadway, thus gra-
dually diminishing from the abutments towards the centre of
the bridge. These are also diagonal iron bars, which are
laid on top of the ribs, and extended to the abutments to
keep the ribs from twisting. The superstructure is a
strong frame of timber placed over to support the carriage-
road, which is composed of mall, lime-lime, and gravel,
with a cement of tar and chalk immediately upon the
planks, to receive them. The whole breadth of the bridge
is 32 feet. The abutments are made of solid masonry,
twenty-four feet in thickness, forty-two in breadth at
bottom, and thirty-seven at top. The foundation pier is
settled on the solid rock, and rises from about twenty-two feet above
the bed of the river. On the north side the ground was
not so favourable, so that it was necessary to carry the founda-
tion ten feet below the bed. The weight of the iron in this
extraordinary fabric amounts to 360 tons; 40 of these are
malleable, and 240 cast. The entire expense was 27,000l.

From this account of the bridge across the Wear, the
attentive reader will see much to admire in its construction:
it is not only wholly, totally free from defects. We conceive
that the spandrels are very improperly filled up. It is true,
that it is done in such a manner as is exceedingly light and
pleasing to the eye; but the iron hoops may, we think, be
casily compressed at the points of contact, and changing
their shape will oppose very little resistance. As the arch
forms so small a portion of a circle (about 64° degrees),
the weight of the spring of the arch need not, according to the
theory of elinbination, be double to that at the crown,
to support, without danger of rising, any prefire arising
from the masts of the structure itself; but in so flat and
light an arch, an overload on any part must have a great
tendency to bend it, and consequently tend considerably
to break it, at a small part, with all the energy of a
long lever: we think, therefore, that a better form might
have been adopted than what has been put in practice at
Wearmouth bridge.

The third iron bridge is that over the Severn at Buildwars,
about two miles above Coalbrook Dale. An old stone
bridge of three narrow arches having been carried away by a
high flood in 1795, the present iron bridge was planned and
built by the Coalbrook Dale Company, under the superin-
undence of Mr. Thomas Telford, the county surveyor, in
1796. Each consists of a single arch, 150 feet in span, the
